PRODUCT DESCRIPTION

The AWT6276 meets the increasing demands for higher output power in UMTS handsets. The PA module is optimized for V_{REF} = +2.85 V, a requirement for compatibility with the Qualcomm® 6275 chipset. The device is manufactured on an advanced InGaP HBT MMIC technology offering state-of-the-art reliability, temperature stability, and ruggedness. Selectable bias modes that optimize efficiency for different output power levels, and a shutdown mode with low leakage current, increase handset talk and standby time. The self-contained 4 mm x 4 mm x 1 mm surface mount package incorporates matching networks optimized for output power, efficiency, and linearity in a 50 Ω system.

The device may be operated safely over these conditions; however, parametric performance is guaranteed only over the conditions defined in the electrical specifications.

Notes:

(1) For operation at V_{CC} = +3.2 V, P_{OUT} is derated by 0.5 dB.

(2) For operation at 110 °C (T_C), P_{OUT} is derated by 1.0 dB.

Shutdown Mode

The power amplifier may be placed in a shutdown mode by applying logic low levels (see Operating Ranges table) to both the V_{REF} and V_{MODE} voltages.

Bias Modes

The power amplifier may be placed in either a Low Bias mode or a High Bias mode by applying the appropriate logic level (see Operating Ranges table) to the V_{MODE} voltage. The Bias Control table lists the recommended modes of operation for various applications.

Three operating modes are recommended to optimize current consumption. High Bias operating mode is for P_{OUT} levels $\geq$ 16 dBm. At P_{OUT} <16dBm, the PA should be "Mode Switched" to Low Bias Mode. For P_{OUT} levels $\leq$ ~7 dBm, the V_{CC} can be switched to 1.5 V (Low Bias Mode is also used for this P_{OUT} range).

Table 5: Bias Control

APPLICATION	P_{OUT} LEVELS	BIAS MODE	V_{REF}	V_{MODE}	V_{CC}

WCDMA - med power	$\leq$ +16 dBm	Low	+2.85 V	+2.85 V	+3.2 - 4.2 V
