

2K x 8 Asynchronous CMOS Static RAM

January 1992

Features

- **Fast Access Time**..... 70/90ns Max
- **Low Standby Current**..... 50 μ A Max
- **Low Operating Current** 70mA Max
- **Data Retention at 2.0 Volts** 20 μ A Max
- **TTL Compatible Inputs and Outputs**
- **JEDEC Approved Pinout (2716, 6116 Type)**
- **No Clocks or Strokes Required**
- **Equal Cycle and Access Time**
- **Single 5 Volt Supply**
- **Gated Inputs**
 - **No Pull-Up or Pull-Down Resistors Required**

Description

The HM-65162 is a CMOS 2048 x 8 Static Random Access Memory manufactured using the Harris Advanced SAJI V process. The device utilizes asynchronous circuit design for fast cycle time and ease of use. The pinout is the JEDEC 24 pin DIP, and 32 pad 8 bit wide standard which allows easy memory board layouts flexible to accommodate a variety of industry standard PROMs, RAMs, ROMs and EPROMs. The HM-65162 is ideally suited for use in microprocessor based systems with its 8 bit word length organization. The convenient output enable also simplifies the bus interface by allowing the data outputs to be controlled independent of the chip enable. Gated inputs lower operating current and also eliminate the need for pull-up or pull-down resistors.

PIN NAMES

PIN	DESCRIPTION
NC	No Connect
A0 - A10	Address Input
\bar{E}	Chip Enable/Power Down
VSS/GND	Ground
DQ0 - DQ7	Data In/Data Out
VCC	Power (+5V)
\bar{W}	Write Enable
\bar{G}	Output Enable

Functional Diagram

Specifications HM-65162

Absolute Maximum Ratings

Supply Voltage	+7.0V
Input, Output or I/O Voltage	GND-0.3V to VCC+0.3V
Storage Temperature Range	-65°C to +150°C
Junction Temperature	+175°C
Lead Temperature (Soldering 10s)	+300°C
Typical Derating Factor	5mA/MHz increase in ICCOP
ESD Classification	Class 1

Reliability Information

Thermal Resistance	θ_{jw}	θ_{jc}
Ceramic DIP Package	48°C/W	8°C/W
Ceramic LCC Package	85°C/W	40°C/W
Maximum Package Power Dissipation at +125°C		
Ceramic DIP Package	1W	
Ceramic LCC Package	0.58W	
Gate Count	26000 Gates	

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Operating Conditions

Operating Voltage Range	+4.5V to +5.5V	Operating Temperature Range	
		HM-65162S-9, HM-65162B-9,	
		HM-65162-9, HM65162C-9	-40°C to +85°C

DC Electrical Specifications VCC = 5V ± 10%; T_A = -40°C to +85°C (HM-65162S-9, HM-65162B-9, HM-65162-9, HM-65162C-9)

SYMBOL	PARAMETER	LIMITS		UNITS	TEST CONDITIONS

(22) TAVWH	Address Valid to End of Write	45	-	50	-	65	-	65	-	ns	(Notes 1, 3)

NOTES:

1. Input pulse levels: 0 to 3.0V; Input rise and fall times: 5ns (max); Input and output timing reference level: 1.5V; Output load: 1 TTL gate equivalent and CL = 50pF (min) - for CL greater than 50pF, access time is derated by 0.15ns per pF.
2. Tested at initial design and after major design changes.
3. VCC = 4.5 and 5.5V.
4. TAVQV = TELQV + TAVEL.

Timing Waveforms

READ CYCLE

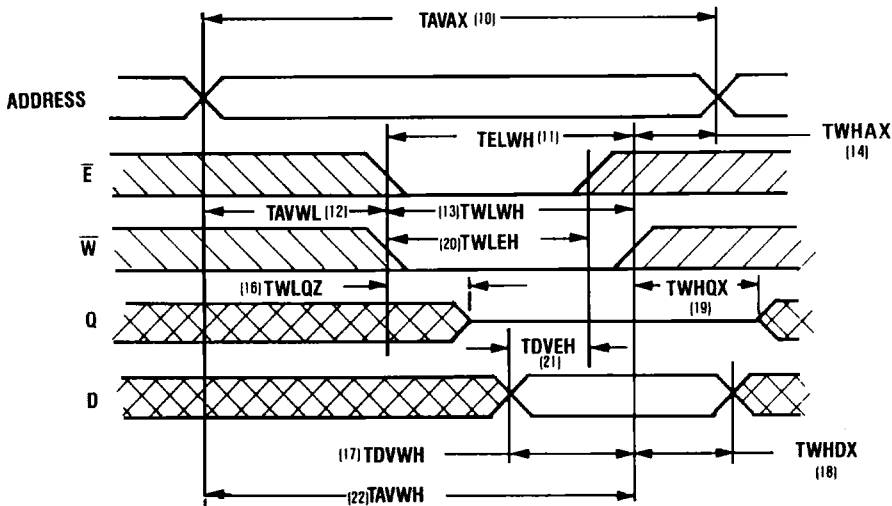

NOTE: \bar{W} is High for a Read Cycle

Addresses must remain stable for the duration of the read cycle. To read, \bar{G} and \bar{E} must be $\leq V_{IL}$ and $\bar{W} \geq V_{IH}$. The output buffers can be controlled independently by \bar{G} while \bar{E} is low. To execute consecutive read cycles, \bar{E} may be tied

low continuously until all desired locations are accessed. When \bar{E} is low, addresses must be driven by stable logic levels and must not be in the high impedance state.

WRITE CYCLE I

NOTE: \bar{G} is Low throughout Write Cycle

To write, addresses must be stable, \bar{E} low and \bar{W} falling low for a period no shorter than T_{WLWH} . Data in is referenced with the rising edge of \bar{W} , (T_{DVWH} and T_{WHDX}). While addresses are changing, \bar{W} must be high. When \bar{W} falls low, the I/O pins are still in the output state for a period of T_{WLQZ}

and input data of the opposite phase to the outputs must not be applied, (Bus contention). If \bar{E} transitions low simultaneously with the \bar{W} line transitioning low or after the \bar{W} transition, the output will remain in a high impedance state. \bar{G} is held continuously low.

Timing Waveforms (Continued)

WRITE CYCLE II

In this write cycle \bar{G} has control of the output after a period, TGHQZ. \bar{G} switching the output to a high impedance state allows data in to be applied without bus contention after

TGHQZ. When \bar{W} transitions high, the data in can change after TWHDX to complete the write cycle.

Low Voltage Data Retention

Harris CMOS RAMs are designed with battery backup in mind. Data retention voltage and supply current are guaranteed over temperature. The following rules insure data retention:

1. Chip Enable (\bar{E}) must be held high during data retention; within $V_{CC} - 0.3V$ to $V_{CC} + 0.3V$.
2. On RAMs which have selects or output enables (e.g., S, \bar{G}), one of the selects or output enables should be held in the deselected state to keep the RAM outputs high impedance, minimizing power dissipation.
3. Inputs which are to be held high (e.g., \bar{E}) must be kept between $V_{CC} + 0.3V$ and 70% of V_{CC} during the power up and down transitions.
4. The RAM can begin operation > 55ns after V_{CC} reaches the minimum operating voltage (4.5 volts).
