Legal Disclaimer

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics (“Beschaffenheitsgarantie”). With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights of any third party.

Information

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office (**www.infineon.com**).

Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

1 Product Overview

1.1 Samurai-6I/6IX (ADM6996I/IX) Overview

The Samurai-6I/6IX (ADM6996I/IX) is a high performance, low cost, highly integrated (Controller, PHY and Memory) five-port 10/100 Mbit/s TX/FX plus one 10/100 MAC port Ethernet switch controller with all ports supporting 10/100 Mbit/s Full/Half duplex. The Samurai-6I/6IX (ADM6996I/IX) is intended for applications such as stand alone bridges for Digital Home Application such as ADSL Router, Wireless Router, EPON/GPON Router, IAD, IP Set Top Box, VOIP and Video application. The Samurai-6IX (ADM6996IX) is the environmentally friendly “green” package version.

Samurai-6I/6IX (ADM6996I/IX) provides advanced functions such as: **802.1p(Q.O.S.), Layer4 Q.O.S, 802.1Q(VLAN), Security, Bandwidth Control, Port Mirror, Hardware IGMP snooping and Easy Management** functions.

The Samurai-6I/6IX (ADM6996I/IX) also supports Back Pressure in Half-Duplex mode and 802.3x Flow Control Pause packet in Full-Duplex mode to prevent packet loss when buffer full. When Back Pressure is enabled and there is no receive buffer available for the incoming packet, the Samurai-6I/6IX (ADM6996I/IX) will issue a JAM pattern on the receiving port in Half Duplex mode and transmit the 802.3x Pause packet back to receiving end in Full Duplex mode.

The built-in SRAM used for packet buffering is divided into 256 bytes/block to achieve the optimized memory utilization through complicated link lists on packets with various lengths.

Samurai-6I/6IX (ADM6996I/IX) also supports priority features by Port-Base, VLAN, UDP/TCP destination port number and IP TOS field checking. Users can easily set different priority modes in individual ports, through a small low-cost micro controller to initialize or on-the-fly to configure. Each output port supports four queues in the way of programmable rate fairness queuing to fit the bandwidth demand on various types of packets such as Voice, Video and Data. 802.1Q, Tag/Untag, and up to 16 groups of VLAN also is supported.

An intelligent address recognition algorithm makes Samurai-6I/6IX (ADM6996I/IX) able to recognize up to 2K different MAC addresses and enables filtering and forwarding at full wire speed.

Security and Port Locking functions are also supported by Samurai-6I/6IX (ADM6996I/IX) to use on Building Internet access to prevent unathourized or multiple users sharing one port traffic.

1.2 Features

- Five 10M/100M auto-detect Half/Full duplex switch ports with **TX/FX** interfaces and one MII/GPSI/RMII port
- 2K MAC address tables with 4-ways associative hash algorithm
- 6KX64 bits packet buffers are divided into 192 blocks of 256 bytes each
- Four queues for QoS
- Priority features by Port-Based, 802.1p, IP TOS, Diffserv, TCP/UDP Destination Port Application-Based of packets
- Store & Forward architecture and performs forwarding and filtering at non-blocking full wire speed
- Single/Dual color LED mode with Power On auto diagnostic. Collision/Duplex LED can be separated using register setting
- 802.3x Flow Control pause packet for Full Duplex
- Back Pressure function for Half Duplex operation
- Supports packet lengths up to 1518/1522 (Default)/1536/1784 bytes in maximum
- Scalable Per Port Bandwidth Control (Both Ingress and Egress).
- Broadcast/Multicast Storm Suppression
- 802.1Q VLAN. Up to 16 VLAN groups are implemented by full 12 bits VID matching
- MAC clone function to enable multiple WAN application

- TP interface Auto MDIX function for auto TX/RX swap by strapping-pin.
- Interrupt pin, Interrupt Register and Interrupt Mask Register. Programmable interrupt polarity (Default active low)
- Easy Management 32-bit smart counter for per port RX/TX byte/packet count, 16-bit smart counter for per port ERROR count and Collision count
- Supports 32 hardware IGMP Table (Multicast Table)
- MAC Address Table is accessible
- Supports 802.1x security function
- Supports Spanning Tree Protocol
- Support Port Mirror
- Support special tag for easy packet control.
- Supports internal counter/PHY status output for management system
- 25M Crystal
- 128 QFP package with 0.18 μm technology. 1.8 V/3.3 V power supply.
- 1.0 W low power consumption.

1.3 Applications

Samurai-6I/6IX (ADM6996I/IX):

- ADSL, VDSL2, Wireless, Wire, Gateway and IP Set Top Box Router
- Voice and Video applications

2 Interface Description

This chapter describes the interface descriptions for the Samurai-6I/6IX (ADM6996I/IX)

- Pin Diagram
- Abbreviations
- Pin Description by Function

2.1 Pin Diagram

Figure 2 shows the pin diagram for the Samurai-6I/6IX (ADM6996I/IX).

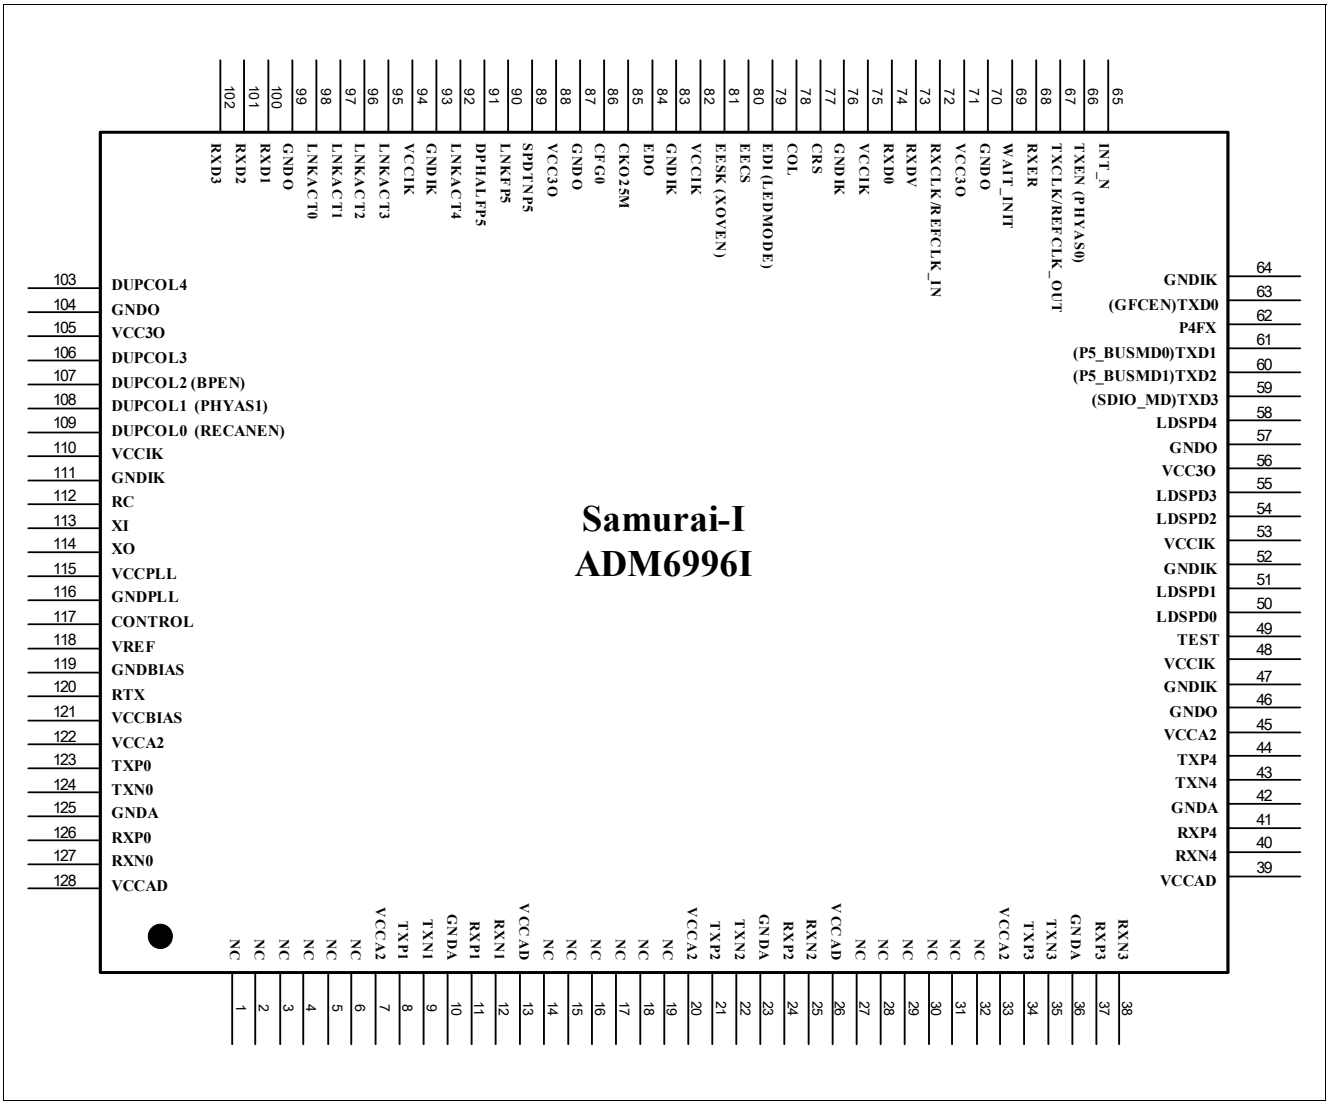

Figure 2 5 TP/FX PORT + 1 MII PORT 128 Pin Diagram

2.2 Abbreviations

Standard abbreviations for I/O tables:

Table 1 Abbreviations for Pin Type

Abbreviations	Description
I	Standard input-only pin. Digital levels.
O	Output. Digital levels.
I/O	I/O is a bidirectional input/output signal.
AI	Input. Analog levels.
AO	Output. Analog levels.
AI/O	Input or Output. Analog levels.
PWR	Power
GND	Ground
MCL	Must be connected to Low (JEDEC Standard)
MCH	Must be connected to High (JEDEC Standard)
NU	Not Usable (JEDEC Standard)
NC	Not Connected (JEDEC Standard)

Table 2 Abbreviations for Buffer Type

Abbreviations	Description
Z	High impedance
PU	Pull up, 10 kΩ
PD	Pull down, 10 kΩ
TS	Tristate capability: The corresponding pin has 3 operational states: Low, high and high-impedance.
OD	Open Drain. The corresponding pin has 2 operational states, active low and tristate, and allows multiple devices to share as a wire-OR. An external pull-up is required to sustain the inactive state until another agent drives it, and must be provided by the central resource.
OC	Open Collector
PP	Push-Pull. The corresponding pin has 2 operational states: Active-low and active-high (identical to output with no type attribute).
OD/PP	Open-Drain or Push-Pull. The corresponding pin can be configured either as an output with the OD attribute or as an output with the PP attribute.
ST	Schmitt-Trigger characteristics
TTL	TTL characteristics

2.3 Pin Description by Function

Samurai-6I/6IX (ADM6996I/IX) pins are categorized into one of the following groups:

- Network Media Connection
- Port 5 MII Interface
- LED Interface
- EEPROM Interface
- Power/Ground, 48 pins
- Miscellaneous

*Note: **Table 1** can be used for reference.*

Table 3 IO Signals

Ball No.	Name	Pin Type	Buffer Type	Function
Network Media Connection				
41	RXP_4	AI/O	ANA	**Receive Pair** Differential data is received on this pin.
37	RXP_3			
24	RXP_2			
11	RXP_1			
126	RXP_0			
40	RXN_4	AI/O	ANA	
38	RXN_3

Port 5 MII Interface				

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
63	GFCEN	I	PU, LVTTL	**Global Flow Control Enable** Value on this pin will be latched by Samurai-6I/6IX (ADM6996I/IX) at the rising edge of RESETL(**RC**) as Flow control enable. *Note: Power On Setting* 0_B Flow Control Capability is dependent upon the register setting in corresponding EEPROM register 1_B All ports flow control capabilities are enabled
	MII_TXD0	O	4 mA, PU, LVTTL	**Port 5 Transmit Data Bit 0 in MII Mode** Bit[0] of MII Transmit data of port 5. Synchronous to the rising edge of MII_TXCLK.
	GPSI_TXD	O	4 mA, PU, LVTTL	**Port 5 Transmit Data in GPSI Mode** When port 5 is operating in GPSI mode, this pin acts as GPSI Transmit Data. Synchronous to the rising edge of GPSI_TXCLK.
	RMII_TXD0	O	4 mA, PU, LVTTL	**Port 5 Transmit Data Bit 0 in RMII Mode** When port 5 is operating in RMII mode, this pin acts as RMII Transmit Data Bit [0]. Synchronous to the rising edge of REFCLK_IN.
61	P5_BUSMD0	I	PD, LVTTL	**Port 5 Bus Mode Selection Bit 0** Value on this pin will be latched by Samurai-6I/6IX (ADM6996I/IX) at the rising edge of RESETL(RC) as port 5 bus mode selection bit 0. Combined with **P5_BUSMD1**, Samurai-6I/6IX (ADM6996I/IX) provides 3 bus type for port 5. P5_BUSMD[1:0], Interface *Note: Power On Setting* 00_B MII 01_B GPSI 10_B RMII 11_B Reserved and not allowed
	MII_TXD1	O	4 mA, PD, LVTTL	**Port 5 Transmit Data Bit 1 in MII Mode** Bit[1] of MII Transmit data of port 5. Synchronous to the rising edge of MII_TXCLK.
	RMII_TXD1	O	4 mA, PD, LVTTL	**Port 5 Transmit Data Bit 1 in RMII Mode** Bit[1] of RMII Transmit data of port 5. Synchronous to the rising edge of REFCLK_IN.

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
60	P5_BUSMD1	I	PD, LVTTL	**Port 5 Bus Mode Selection Bit 1** Value on this pin will be latched by Samurai-6I/6IX (ADM6996I) at the rising edge of RESETL as port 5 bus mode selection bit 1. Combined with **P5_BUSMD0**, Samurai-6I/6IX (ADM6996I/IX) provides 3 bus types for port 5. *Note: Power On Setting*
	MII_TXD2	O	4 mA, PD, LVTTL	**Port 5 Transmit Data Bit 2 in MII Mode** Bit[2] of MII Transmit data of port 5. Synchronous to the rising edge of MII_TXCLK.
59	SDIO_MD	I	PD, LVTTL	**SDC/SDIO Mode Selection** Value on this pin will be latched by the Samurai-6I/6IX (ADM6996I/IX) at the rising edge of RESETL as **SDC**/**SDIO** control signal which is used to select 16 bits for advanced features. *Note: Power On Setting and also there is a 32-bit mode option. However the 32-bit option does not accomodate the ADM6996I/IX's advanced features.* 0_B 16 bits mode, MDC/MDIO timing compatible.
	MII_TXD3	O	4 mA, PD, LVTTL	**Port 5 Transmit Data Bit 3 in MII Mode** Bit[3] of MII Transmit data of port 5. Synchronous to the rising edge of MII_TXCLK.
66	PHYAS0	I	PD, LVTTL	**PHY Address MSB Bit 0** During power on reset, value will be latched by Samurai-6I/6IX (ADM6996I/IX) at the rising edge of RESETL as PHY starts address select. PHYAS[1:0] = 00_B and PHY address starts from 01000_B. *Note: Power On Setting*
	MII_TXEN	O	8 mA, PD, LVTTL	**Port 5 Transmit Enable TXEN in MII Mode** Active high to indicate that the data on MII_TXD[3:0] is valid. Synchronous to the rising edge of MII_TXCLK.
	GPSI_TXEN	O	8 mA, PD, LVTTL	**Port 5 Transmit Enable TXEN in GPSI Mode** Active high to indicate that the data on GPSI_TXD is valid. Synchronous to the rising edge of GPSI_TXCLK.
	RMII_TXEN	O	8 mA, PD, LVTTL	**Port 5 R Transmit Enable TXEN in RMII Mode** Active high to indicate that the data on RMII_TXD[1:0] is valid. Synchronous to the rising edge of REFCLK_IN.

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
74	MII_RXD0	I	PD, LVTTL	**Port 5 Receive Data Bit 0 in MII Mode** In MII mode, the bit[0] of MII receive data, synchronous to the rising edge of MII_RXCLK.
	GPSI_RXD	I	PD, LVTTL	**Port 5 Receive Data in GPSI Mode** In GPSI Mode, this acts as Receive Data Input, synchronous to the rising edge of GPSI_P5RXCLK.
	RMII_RXD0	I	PD, LVTTL	**Port 5 Receive Data Bit 0 in RMII Mode** In RMII mode, bit[0] of RMII receive data, synchronous to the rising edge of REFCLK_IN.
100	MII_RXD1	I	PD, LVTTL	**Port 5 Receive Data Bit 1in MII Mode** In MII mode, bit[1] of MII receive data, synchronous to the rising edge of MII_RXCLK.
	RMII_RXD1	I	PD, LVTTL	**Port 5 Receive Data Bit 1in RMII Mode** In RMII mode, bit[1] of RMII receives data, synchronous to the rising edge of REFCLK_IN.
101	MII_RXD2	I	PD, LVTTL	**Port 5 Receive Data Bit 2 in MII Mode** In MII mode, bit[2] of MII receives data. Synchronous to the rising edge of MII_RXCLK.
102	MII_RXD3	I	PD, LVTTL	**Port 5 Receive Data Bit 3 in MII Mode** In MII mode, bit[3] of MII receive data. Synchronous to the rising edge of MII_RXCLK.
73	MII_RXDV	I	PD, LVTTL	**Port 5 Receive Data Valid in MII Mode** Active high to indicate that the data on MII_RXD[3:0] is valid. Synchronous to the rising edge of MII_RXCLK.
	RMII_CRSDV	I	PD, LVTTL	**Port 5 Carrier Sense and Receive Data Valid in RMII Mode** Active high to indicate that the data on RMII_RXD[1:0] is valid. Synchronous to the rising edge of REFCLK _IN.
68	MII_RXER	I	PD, LVTTL	**Port 5 Receive Error in MII Mode** Active high to indicate that there is an error on the MII_P5RXD [3:0]. Upon receiving this signal, Samurai-6I (ADM6996I/IX) will send Error Symbol onto the medium. Only valid in 100M operation.
	RMII_RXER	I	PD, LVTTL	**Port 5 Receive Error in RMII Mode** Active high to indicate that there is error on the RMII_P5 RXD[1:0]. Upon receiving this signal, Samurai-6I/6IX (ADM6996I/IX) will send Error Symbol onto the medium. Only valid in 100M operation.

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
77	MII_CRS	I	PD, LVTTL	**Port 5 Carrier Sense in MII Mode** In full duplex mode, MII_P5CRS reflects the receive carrier sense situation on medium only; In Half Duplex, MII_P5CRS will be high both in receive and transmit conditions.
	GPSI_CRS	I	PD, LVTTL	**Port 5 Carrier Sense in GPSI Mode** In full duplex mode, GPSI_P5CRS reflects the receive carrier sense situation only on the medium; In Half Duplex, GPSI_P5CRS will be high both under receive and transmit conditions.
78	MII_COL	I	PD, LVTTL	**Port 5 Collision Input in MII Mode** Active high to indicate that there is collision on the medium. Stays low in full duplex operation.
	GPSI_COL	I	PD, LVTTL	**Port 5 Collision Input in GPSI Mode** Active high to indicate that there is collision on the medium. Stays low in full duplex operation.
72	MII_RXCLK	I	PD, LVTTL	**Port 5 Receive Clock Inputin MII Mode** MII_RXDV and MII_RXD[3:0] are synchronous to the rising edge of this clock. It is free running 25MHz clock in 100M mode and 2.5MHz clock in 10M mode.
	GPSI_RXCLK	I	PD, LVTTL	**Port 5 Receive Clock Input in GPSI Mode** GPSI_RXD are synchronous to the rising edge of this clock. It is non-continuous 10MHz Clock input.
	REFCLK_IN	I	PD, LVTTL	**50MHz Reference Clock Input in RMII mode** RMII_RXD[1:0], RMII_TXD[1:0], RMII_TXEN and RMII_CRSDV are synchronous to the rising edge of this clock.
67	MII_TXCLK	I	PD, LVTTL	**Port 5 Transmit Clock Input in MII Mode** MII_P5TXEN and MII_P5TXD[3:0] are output at the rising edge of this clock. It is free running 25MHz clock in 100M mode and 2.5MHz clock in 10M mode.
	GPSI_TXCLK	I	PD, LVTTL	**Port 5 Transmit Clock Input in GPSI Mode** GPSI_TXEN and GPSI_TXD are synchronous to the rising edge of this clock. It is a continuous 10MHz Clock input.
	REFCLK _ OUT	O	8 mA, PD, LVTTL	**50MHz Reference Clock Output in RMII mode** This pin is used as a 50MHz reference clock signal output pin when port 5 operates in RMII mode.
89	SPDTNP5	I	PD, LVTTL	**Port 5 Speed Input** 0_B 100M 1_B 10M
90	LNKFP5	I	PD, LVTTL	**Port 5 Link Fail Status Input** 0_B Link Up 1_B Link Failed

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
91	DPHALFP5	I	PD, LVTTL	**Port 5 Duplex Status Input** 0_B Full Duplex 1_B Half Duplex
LED Interface				
103	DUPCOL4	O	8 mA, PD, LVTTL	**Port 4 Duplex /Collision LED** In Full duplex mode, this pin acts as DUPLEX LED for port 4, respectively; in half duplex mode, it is collision LED for each port. See **Chapter 3.1.12 LED Display** for more detail.
106	DUPCOL3	O	8 mA, PD, LVTTL	**Port 3 Duplex /Collision LED** In Full duplex mode, this pin acts as a DUPLEX LED for port 3, respectively; in half duplex mode, it is the collision LED for each port. See **Chapter 3.1.12 LED Display** for more detail.
107	BPEN	I	PU, LVTTL	**Recommended Back-Pressure in Half-Duplex** Value on this pin will be latched by Samurai-6I (ADM6996I/IX) during power on reset as the back-pressure enable in half-duplex mode. *Note: Power On Setting* 0_B Disable Back-Pressure 1_B Enable Back-Pressure
	DUPCOL2	O	8 mA, PU, LVTTL	**Port 2 Duplex-collision LED** In Full duplex mode, this pin acts as port 2 DUPLEX LED; in half duplex mode, it is collision LED for port 2. See **Chapter 3.1.12 LED Display** for more detail.
108	PHYAS1	I	PD, LVTTL	**Recommend PHY Address Bit 1** Value on this pin will be latched by Samurai-6I/6IX (ADM6996I/IX) during power on reset as the PHY address recommend value bit 1. See **PHYAS0** description for more detail. *Note: Power On Setting*
	DUPCOL1	O	8 mA, PD, LVTTL	**Port 1 Duplex-collision LED** In Full duplex mode, this pin acts as port 1 DUPLEX LED; in half duplex mode, it is collision LED for port 1. See **Chapter 3.1.12 LED Display** for more detail.

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
109	RECANEN	I	PU, LVTTL	**Recommend Auto Negotiation Enable** Only valid for Twisted pair interface. Programming this bit to 1 has no effect on the Fiber port. *Note: Power On Setting.* 0_B Disable all TP port auto negotiation capability 1_B Enable all TP port auto negotiation capability
	DUPCOL0	O	8 mA, PU, LVTTL	**Port 0 Duplex-collision LED** In Full duplex mode, this pin acts as port 0 DUPLEX LED; in half duplex mode, it is a collision LED for port 0. See **Chapter 3.1.12 LED Display** for more detail.
92	LNKACT_4	O	8 mA, PD, LVTTL	**LINK/Activity LED of Port 4 to 0** Used to indicate corresponding port's link/activity status, see **Chapter 3.1.12 LED Display** for more detail.
95	LNKACT_3			
96	LNKACT_2			
97	LNKACT_1			
98	LNKACT_0			
58	LDSPD_4	O	8 mA, PD, LVTTL	**Port 4 to Port 0 Speed LED** Used to indicate corresponding port's speed status, see **Chapter 3.1.12 LED Display** for more detail.
55	LDSPD_3			
54	LDSPD_2			
51	LDSPD_1			
50	LDSPD_0			
EEPROM Interface				
84	EDO	I	PU, LVTTL	**EEPROM Data Output** This pin is used to input EEPROM data when reading the EEPROM. During Samurai-6I (ADM6996I/IX) initialization, Samurai-6I/6IX (ADM6996I/IX) will drive EEPROM interface signal to read settings from EEPROM. Any other devices attached to the EEPROM interface SHOULD drive Hi-Z or keep tristate during this period. See **Chapter 3.4.2 EEPROM Interface** for more detail.

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
80	IFSEL	I	PD, LVTTL	**Interface Selection** After Samurai-6I (ADM6996I/IX) initialization process is done, this pin is used to select using the EEPROM interface or SDC/SDIO interface. EECS/IFSEL interface 0_B SDC/SDIO interface 1_B EEPROM interface
	EECS	O	4 mA, PD, LVTTL	**EEPROM Chip Select** During Samurai-6I (ADM6996I/IX) initialization, this pin is used as EEPROM chip select signal. During Samurai-6I/6IX (ADM6996I/IX) initialization, Samurai-6I/6IX (ADM6996I/IX) will drive EEPROM interface signal to read settings from EEPROM. Any other devices attached to EEPROM interface SHOULD drive Hi-Z or keep tristate during this period. See **Chapter 3.4.2 EEPROM Interface** for more detail.
81	XOVEN	I	PD, LVTTL	**Cross Over Enable** Value on this pin (active low) will be latched by Samurai-6I/6IX (ADM6996I/IX) at the rising edge of RESETL for port 4~0 crossover auto detect (Only available in TP interface). *Note: Power On Setting.* 0_B Disable 1_B Enable
	EESK	I/O	4 mA, PD, LVTTL	**EEPROM Serial Clock** During Samurai-6I/6IX (ADM6996I/IX) initialization, this pin is used to output clock to EEPROM. After Samurai-6I/6IX (ADM6996I/IX) initialization process is done, this pin is used as EEPROM interface clock input if **IFSEL** = 1.
	SDC	I	PD, LVTTL	**Serial Management interface Clock input** If **IFSEL** = 0, this pin is used as serial management interface clock input.SDC timing is the same as MDC when chip set in 16-bit mode.

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
79	LED_MODE	I	PD, LVTTL	**Enable Mac to Choose LED Display Mode** Value on this pin will be latched by Samurai-6I/6IX (ADM6996I/IX) on the rising edge of RESETL as single/dual color LED mode control signal. See **Chapter 3.1.12 LED Display** for more detail. *Note: Power On Setting.*
	EDI	I/O	8 mA, PD, LVTTL	**EEPROM Serial Data Input** During Samurai-6I/6IX (ADM6996I/IX) initialization this pin is used to output address and command to access EEPROM. After the initialization process is done, this pin becomes an input pin to monitor EEPROM data if **IFSEL** = 1.
	SDIO	I/O	8 mA, PD, LVTTL	**Serial Management interface Data input/Output** If **IFSEL** = 0, this pin is used as data input/output pin of serial management interface.SDIO timing is the same as MDIO when chip set in 16 bits mode.
Power/Ground, 48 Pins				
10, 23, 36, 42, 125	GNDA	GND	–	**Ground** Used by AD Block
7, 20, 33, 45, 122	VCCA2	PWR	–	**1.8 V, Power** Used by TX Line Driver
13, 26, 39, 128	VCCAD	PWR	–	**3.3 V, Power** Used by AD Block
119	GNDBIAS	GND	–	**Ground** Used by Bias Block
121	VCCBIAS	PWR	–	**3.3 V, Power** Used by Bias Block.
116	GNDPLL	GND	–	**Ground** Used by PLL
115	VCCPLL	PWR	–	**1.8 V, Power** Used by PLL
47, 52, 64, 76, 83, 93	GNDIK	GND	–	**Ground** Used by Digital Core
48, 53, 75, 82, 94, 110	VCCIK	PWR	–	**1.8 V, Power** Used by Digital Core
46, 57, 70, 87, 99, 104	GNDO	GND	–	**Ground** Used by Digital Pad
56, 71, 88, 105	VCC3O	PWR	–	**3.3 V, Power** Used by Digital Pad
Miscellaneous				

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
62	P4FX	I	PD, LVTTL	**Port 4 Fiber Selection** During power on reset, value will be latched by Samurai-6I/6IX (ADM6996I/IX) at the rising edge of RESETL as Port 4 Fiber select. 0_B Twisted Pair Mode 1_B Fiber Mode
1, 2, 3, 4, 5, 6, 14, 15, 16, 17, 18, 19, 27, 28, 29, 30, 31, 32	NC	-	-	**Not Connected**
49	TEST	I	PD, LVTTL	**Test Mode** Reserved and should be kept 0 under normal operation.
86	CFG0	I	PU, LVTTL	**Configuration 0** Reserved and should be kept 0 when under normal operation.
69	WAIT_INIT	I	PD, LVTTL	**Wait Initialization** This pin will be used to pause all activities after power up until loading EEPROM is successful and done or CPU initialization is done.. 0_B pause until loading EEPROM done. 1_B pause until loading EEPROM successful and done or CPU initialization is done.
65	INT_N	O	OD,8 mA	**Interrupt** Active low interrupt signal to indicate the status change in the interrupt status register. Interrupt signal will be kept active until the host reads the status of the **IS** register. 0_B Interrupt 1_B Not interrupt
85	CKO25M	O	8 mA, PD, LVTTL	**25MHz Clock Output** Free Running 25MHz Clock output (Even during power on reset).
112	RC	I	ST	**RC Input For Power On Reset** This pin is sampled by using the 25MHz free running clock signal which inputs from **XI** to generate the low-active reset signal, RESETL. See **Chapter 5.3.2 Power On Reset** for the timing requirement.
113	XI	AI	ANA	**25MHz Crystal /Oscillator Input** 25MHz Crystal or Oscillator Input. Variation is limited to +/-50ppm.
114	XO	AO	ANA	**25M Crystal Output** When connected to oscillator, this pin should be left unconnected.
120	RTX	AI	ANA	**Constant Voltage Reference** External 1.0 kΩ 1% resistor connection to ground.

Table 3 IO Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
118	VREF	AI	ANA	**Analog Reference Voltage** Used by Internal Bias Circuit for voltage reference. External 0.1uF capacitor connection to ground for noise filter.
117	CONTROL	AI/O	ANA	**FET Control Signal** The pin is used to control FET for 3.3 V to 1.8 V regulator. External 0.1uF capacitor connection to ground for noise filter, even if the pin is un-connected.

3 Function Description

3.1 Switch Functional Description

The Samurai-6I/6IX (ADM6996I/IX) uses a “store & forward” switching approach for the following reasons:

1. Store & forward switches allow switching between different speed media (e.g. 10BaseX and 100BaseX). Such switches require large elastic buffers, especially when bridging between a server on a 100 Mbit/s network and clients on a 10 Mbit/s segment
2. Store & forward switches improve overall network performance by acting as a “network cache”
3. Store & forward switches prevent the forwarding of corrupted packets by the frame check sequence (FCS) before forwarding to the destination port

3.1.1 Basic Operation

The Samurai-6I/6IX (ADM6996I/IX) receives incoming packets from one of its ports, uses the source address (SA) and FID to update the address table, and then forwards the packet to the output ports determined by the destination address (DA) and FID.

If the DA and FID are not found in the address table, the Samurai-6I/6IX (ADM6996I/IX) treats the packet as a broadcast packet and forwards the packet to the other ports within the same group.

The Samurai-6I/6IX (ADM6996I/IX) can automatically learn the port number of attached network devices together with the SA and FID of all the incoming packets. If the SA and FID are not found in the address table, the Samurai-6I/6IX (ADM6996I/IX) adds it to the table.

3.1.2 Buffers and Queues

The Samurai-6I/6IX (ADM6996I/IX) incorporates 6 transmit queues and receive buffer areas for the 6 Ethernet ports. The receive buffers, as well as the transmit queues, are located within the Samurai-6I/6IX (ADM6996I/IX) along with the switch fabric. The buffers are divided into 192 blocks of 256 bytes each. The queues of each port are managed according to each port’s read/write pointer.

Input buffers and output queues are maintained through proprietary patent pending UNIQUE (Universal Queue management) scheme.

3.1.3 Full Duplex Flow Control

When a full duplex port runs out of its receive buffers, a PAUSE command will be issued by Samurai-6I/6IX (ADM6996I/IX) to notify the packet sender to pause transmission. This frame based flow control is totally compliant to IEEE 802.3x. When the flow control hardware pin (**GFCEN**) is set to high, during power on reset, and per port PAUSE is enabled, Samurai-6I/6IX (ADM6996I/IX) will output and accept 802.3x flow control packets.

3.1.4 Half Duplex Flow Control

Back-pressure is supported for half-duplex operation. When the Samurai-6I/6IX (ADM6996I/IX) cannot allocate a receive buffer for an incoming packet (buffer full), the device will transmit a jam pattern on the port, thus forcing a collision.

3.1.5 Back-Off Algorithm

The Samurai-6I/6IX (ADM6996I/IX) implements the truncated exponential back off algorithm compliant to the 802.3 standard. Samurai-6I/6IX (ADM6996I/IX) will restart the back off algorithm by choosing 0-9 collision count. After 16 consecutive retransmit trials, the Samurai-6I/6IX (ADM6996I/IX) resets the collision counter. Users can set the Back Off (see 0010_H, **BD**) to disable this function.

3.1.6 Inter-Packet Gap (IPG)

IPG is the idle time between any two successive packets from the same port. The value is 9.6 µs for 10 Mbit/s Ethernet and 960 ns for 100 Mbit/s fast Ethernet. For the receive end, Samurai-6I/6IX (ADM6996I/IX) is designed to be able to tolerate IPG gaps greater than 64 bits. For the transmit end, Samurai-6I/6IX (ADM6996I/IX) will always transmit packets with the minimum IPG gap equal to 96 bits. If users want to shorten the transmission IPG gap, they can enable the Short IPG function (see $000B_H$, **TSIE**). Then Samurai-6I/6IX (ADM6996I/IX) will instruct its output MAC to transmit packets with IPG equal to 88 bits and 96 bits in order.

3.1.7 Trunking Function

Samurai-6I/6IX (ADM6996I/IX) supports only one trunking group. If Port 3 and Port 4 Trunk (see $000B_H$, **TE**) the function is enabled, Samurai-6I/6IX (ADM6996I/IX) will see Port 3 and Port 4 as the same port to make the bandwidth equal to 200M. When any of these two ports link fail, the Samurai-6I/6IX (ADM6996I/IX) will automatically change the transmit path from the failed link to link good port. Output port based load balancing is implemented in Samurai-6I/6IX (ADM6996I/IX), so users don't set anything.

3.1.8 Illegal Frames

The Samurai-6I/6IX (ADM6996I/IX) will discard all illegal packets. These packets are

1. Undersize packets: The packets received with a length of less than 64 bytes are discarded
2. Oversize packets: The packets received with a length of more than "MAXPKTLEN" bytes are discarded. See (0011_H, **MPL**)to see how to decide the MAXPKTLEN value
3. CRC packets: The packets received with a wrong FCS value are discarded
4. Symbol error packets: The packets received with symbol error are discarded
5. Source violation packets: The packets received with a source violation could be discarded in some cases. See (**Source Violation**) description.
6. VLAN violation packets: The frames received with a VLAN violation can be discarded in some cases. See (**VLAN Violation**) description

3.1.9 Broadcast/Multicast Storm

Samurai-6I/6IX (ADM6996I/IX) allows users to limit the traffic of the broadcast address (DA = $FFFFFFFFFFFF_H$) to prevent them from blocking the switch bandwidth. If users also want to limit the multicast packets(DA[40] = 1_B), they can set the Multicast Packet Counted into Storming Counter (see 0010_H, **MP**) function. Two thresholds and storm enable bits (see $003B_H$ and $003C_H$, **STORM_EN**, **STORM_100_TH**, **STORM_10_TH**) are used to control the broadcast storm.

1. Time Scale. Samurai-6I/6IX (ADM6996I/IX) uses 50ms as a scale to meter the storm packets.

Parameter	Rising Threshold	Falling Threshold
All link ports are 100M	100M Threshold (See $003B_H$)	1/2 100M Threshold
All link ports are not all 100M	10M Threshold (See $003C_H$)	1/2 10M Threshold

2. Storm keeps on at least 1.6 seconds if any of the ports meets the rising threshold in the 4 consecutive 50 ms intervals. In these 1.6 seconds, the ports meeting the rising threshold will start to discard the broadcast or multicast packets until the 50 ms interval expires. Users could also disable Input Filter (see $000B_H$, **IF**) function to forward above packets to the un-congested port instead of discarding directly.

3. Storm finishes. After the 1.6-second storm period, Samurai-6I/6IX (ADM6996I/IX) will check the port that makes the storm on. If all of these ports meet the falling threshold in the 2 consecutive 50 ms intervals and no other ports satisfy the rising threshold at the same time, the storm will finish.

3.1.10 Bandwidth Control

Samurai-6I/6IX (ADM6996I/IX) supports hardware-based bandwidth control for both ingress and egress traffic. Ingress and egress rate can be limited independently on each port base. The Samurai-6I/6IX (ADM6996I/IX) provides several timer scales corresponding to different the bandwidth control unit, so users can configure the rate equal to K * (Bandwidth Step), 1 <= K <= 2048. Different timer scales can optimize the QoS performance by different bandwidth control unit. Samurai-6I/6IX (ADM6996I/IX) maintains two counters (input and output) for each port. For example, if users want to limit rate equal to 64 kbit/s, they should configure the bandwidth control threshold equal to 1. At each time unit, Samurai-6I/6IX (ADM6996I/IX) will add 64 to the counter and decrease the byte length when receiving a packet in this period. When the counter is decreased to zero, we can divide the control behavior into two parts:

For the ingress control, the ingress port will not receive packets any more. If flow control is enabled, Pause packets will be transmitted, if Back Pressure is enabled, Jam packets will be transmitted, and if the above functions are not enabled, the packets will be discarded.

For the egress control, the egress port will not transmit any packets, so the egress bandwidth is controlled.

Samurai-6I/6IX (ADM6996I/IX) allows users to control the ingress and egress bandwidth at the same time (see 0033_H, **Bandwidth Control Enable Register**).

For Example, set P0 receive bandwidth control to 6 Mbit/s.

1. Set the receive bandwidth of P0. N= {R0BW_TH3, R0BW_TH2, R0BW_TH1, R0BW_TH0, 6'b0} = 0x005e
2. Enable P0 receive bandwidth control. Set 0033_H[0]=1

Table 4 Bandwidth Control Timer Select

[10:9]0029_H	Timer Scale	Bandwidth Step	Applied Range
00	8ms	64Kbps	64Kbps~2.2Mbps
01	1ms	512Kbps	512Kbps~18Mbps
10	40us	200Kbps	200Kbps~100Mbps
11	500us	16Kbps	16Kbps~32Mbps

3.1.11 Smart Discard

The Samurai-6I/6IX (ADM6996I/IX) supports a smart mechanism to discard packets early according to their priority to prevent the resource blocked by the low priority. The discard ratio is as follows:

Table 5 Smart Disacrd

Queue	Discard Mode
Queue 3	Discard Mode of Queue 3 in 0010_H[15:14]
Queue 2	Discard Mode of Queue 2 in 0010_H[13:12]
Queue 1	Discard Mode of Queue 1 in 0010_H[11:10]
Queue 0	Discard Mode of Queue 0 in 0010_H[9:8]

Table 6 Discard Ratio

Discard Mode	00	01	10	11
Utilization 00	0%	0%	0%	0%
Utilization 01	0%	0%	25%	50%
Utilization 11	0%	25%	50%	75%

3.1.12 LED Display

Three LEDs per port are provided by Samurai-6I/6IX (ADM6996I/IX): Link/Act, Duplex/Col and Speed. The dual-color LED mode is also supported by Samurai-6I/6IX (ADM6996I/IX). For ease of production purposes, the test signal is sent to each LED at power on reset stage. The LED display mode is controlled by:

1. **DUAL-COLOR-EE** (see 0012_H): It is an EEPROM register to control the dual or single color mode. It is useless when the value (wait_init) on the pin **WAIT_INIT** is low.
2. **LED_MODE**: It is the value latched on the EDI pin during the power on reset. It's also used to control the dual or single color mode and is useless when the value wait_init is high.
3. **LED-ENABLE** (see 0012_H): When CPU is attached and this CPU has no ability to pull the EDI to high or low, users can set the wait_init to high to delay the LED test, write the correct value to the **DUAL-COLOR-EE**, write 1_B into register **LED-ENABLE**, and then the LED test starts.
4. **DUP_COL_SEP** (see 0012_H): Dupcol LEDs indicate the duplex status only.
5. **DHCOL_LED_EN** (See 0030_H): When enabled, pin DUPCOL0 shows col_10m status and pin DUPCOL1 shows col_100m status. These two LEDs are necessary in the dual-speed hub.

3.1.12.1 Single Color LED Display

Table 7 Single Color LED Display

Pin Name	Status
LNKACT4/LNKACT3/ LNKACT2/LNKACT1/ LNKACT0	These pins have no power on reset values on them, and Samurai-6I/6IX (ADM6996I/IX) uses active low value to drive the LED. So the output values of these pins after the power on reset are shown as follows: 1. First period: This period lasts 1.28s for LED on test. Samurai-6I/6IX (ADM6996I/IX) drives value 0 to open the LED. 2. Second period: This period lasts 0.48s for LED off test. Samurai-6I/6IX (ADM6996I/IX) drives value 1 to close the LED. 3. Normal Period: This period indicates the link status. 0_B Port links up and LED is ON. 1_B Port links down and LED is OFF. $0/1_B$ Port links up and is transmitting or receiving. The LED flashes at 10 Hz.
LDSPD4/LDSPD3/ LDSPD2/LDSPD1/ LDSPD0	The behavior of these pins is the same as the LNKACT, except during normal period. Normal period: This period indicates the speed status. 0_B Port links up and its speed is 100M. LED is ON. 1_B Port links down or its speed is 10M. LED is OFF.

Table 7 Single Color LED Display (cont'd)

Pin Name	Status
DUPCOL2/ DUPCOL1/ DUPCOL0	These 3 pins have power on reset values on them. Samurai-6I/6IX (ADM6996I/IX) needs to consider these values to drive the correct value. If the power on reset value is value_power_on, then the display is as follows: 1. First period: This period lasts 1.28s for LED on test. Samurai-6I/6IX (ADM6996I/IX) drives ~value_power_on to open the LED. 2. Second period: This period lasts 0.48s for LED off test. Samurai-6I/6IX (ADM6996I/IX) drives value_power_on to close the LED. 3. Normal Period: This period indicates the duplex/collision status. ~value_power_on = Port links up in the full-duplex mode. LED is ON. value_power_on = Port links down. LED flashes at 10 Hz. $0/1_B$ Port links up and collision is detected. The LED flashes at 10 Hz. If **DUP_COL_SEP** is enabled, the normal period changes its way to display. ~value_power_on = Port links up in the duplex mode. LED is ON. value_power_on = Port links down or links up in the half-duplex mode. LED is OFF. $0/1_B$ This value is cancelled. LED doesn't blink. If **DHCOL_LED_EN** is enabled, the display in the normal period is as follows: DUPCOL0: 10m collision indicator. $0/1_B$ One of the ports links up in 10M half-duplex mode and detects a collision event. The LED flashes at 20 Hz. value_power_on = When the above event is not satisfied, the LED is OFF. DUPCOL1: 100 m collision indicator. $0/1_B$ One of the ports links up in 100M half-duplex mode and detects a collision event. The LED flashes at 20 Hz. value_power_on = The above event is not satisfied. LED is OFF.
DUPCOL4/ DUPCOL3	The behavior of these pins is the same as the LNKACT, except during normal period. Normal period: This period indicates the duplex/collision status. ~value_power_on = Port links up in the full-duplex mode. LED is ON. value_power_on = Port links down. LED is OFF. $0/1_B$ Port links up and collision is detected. The LED flashes at 10 Hz. If **DUP_COL_SEP** is enabled, the normal period changes its way to display. ~value_power_on = Port links up in the duplex mode. LED is ON. value_power_on = Port links down or links up in the half-duplex mode. LED is OFF. $0/1_B$ This value is cancelled. LED doesn't blink.

3.1.12.2 Dual Color LED Display

Users should be careful that DUPCOL LED only supports single color mode. The only difference between single and dual color for DUPCOL LED is the self-test time.

Table 8 Dual Color LED Display

Pin Name	Status
(LNKACT4, LDSPD4)/ (LNKACT3, LDSPD3) (LNKACT2, LDSPD2) (LNKACT1, LDSPD1) (LNKACT0, LDSPD0)	First Period: Test LED on with green color. It lasts 1.28 s. 01_B LED is on with green color. Second Period: Test LED on with yellow color. It lasts 1.28 s. 10_B LED is on with yellow color. Third period: Test LED off. 00_B LED is off. Normal Period: This period shows the status of the link and speed at the same time. 00_B Port links down.LED is off. 11_B Port links down. LED is off. 01_B Port links up in 100M. LED glows green. 10_B Port links up in 10M. LED glows yellow. $0/1,1_B$ Port links up in 100M and is receiving or transmitting. LED blinks with green color at 10 Hz. $0/1,0_B$ Port links up in 10M and is receiving or transmitting. LED blinks with yellow color at 10 Hz.
DUPCOL4/DUPCOL3/ DUPCOL2/DUPCOL1/ DUPCOL0	The behavior of these pins is the same as the single mode, except the self-test period. The LED on test period is 2.56 s instead of 1.28 s.

3.1.12.3 Circuit for Single LED Mode

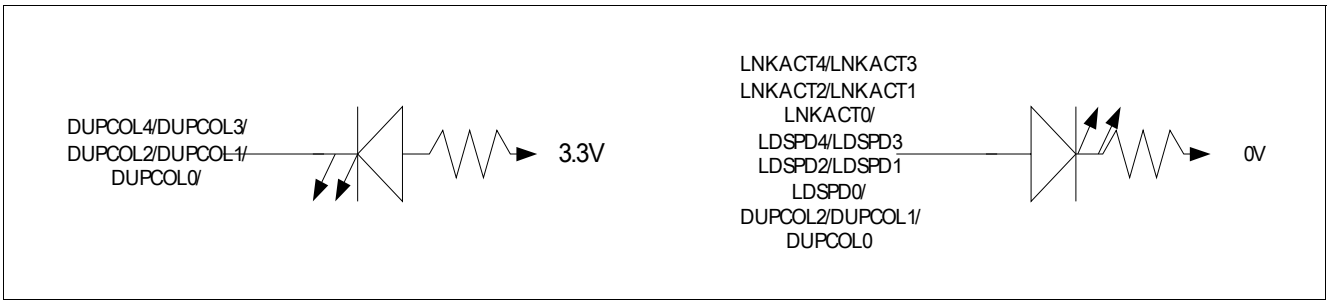

Figure 3 Circuit for Single Color LED Mode

3.1.12.4 Circuit for Dual LED Mode

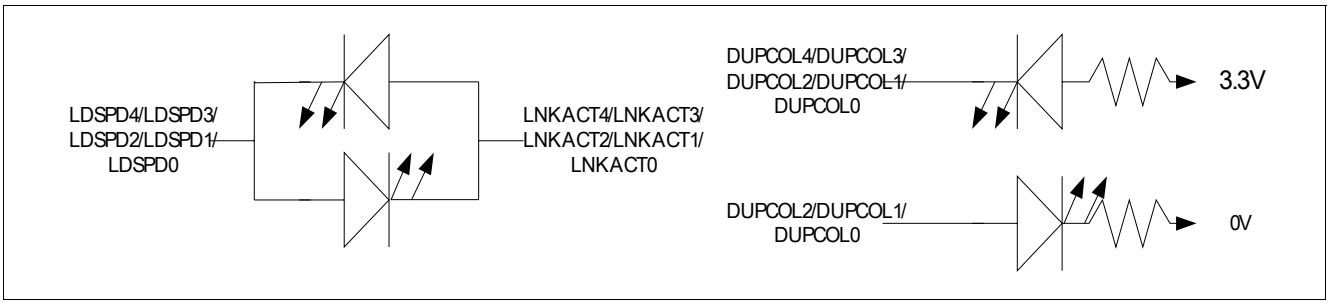

Figure 4 Circuit for Dual Color LED Mode

3.1.13 Packet Identification

Packets are classified to determine if they should be passed to the CPU port or another entity for special handling.

Table 9 Packet Identification

Packets Identified by Samurai-6I/6IX (ADM6996I/IX)		Comments
BPDU		The Ethernet destination address is 01 80 C2 00 00 00_H.
PAUSE		The Ethernet destination address is 01 80 C2 00 00 01_H. Ether-Type field is 8808_H. OPCODE is 0001_H.
SLOW		The Ethernet destination address is 01 80 C2 00 00 02_H.
PAE		The Ethernet destination address is 01 80 C2 00 00 03_H.
RESER_R0		The Ethernet destination address ranges between 01 80 C2 00 00 04_H and 01 80 C2 00 00 $0F_H$.
RESER_R1		The Ethernet destination address ranges between 01 80 C2 00 00 10_H and 01 80 C2 00 00 $1F_H$.
GXRP		The Ethernet destination address ranges between 01 80 C2 00 00 20_H and 01 80 C2 00 00 22_H.
RESER_R2		The Ethernet destination address ranges between 01 80 C2 00 00 23_H and 01 80 C2 00 00 $2F_H$.
RESER_R3		The Ethernet destination address ranges between 01 80 C2 00 00 30_H and 01 80 C2 00 00 FF_H.
RARP		The Ethernet destination address is FF FF FF FF FF FF_H and the Ether-Type field is 8035_H.
ARP		The Ethernet destination address is FF FF FF FF FF $FF_H$and the Ether-Type field is 8036_H.
IGMP_IP		The Ethernet destination address is 01 00 5E xx xx xx_H. Ether-Type field is 0800_H (IP). IP Version is 4 and the Protocol field is 02_H (IGMP).
MLD_IP		Ethernet destination address is 33 33 xx xx xx xx_H. The Ether-Type field is 0800_H (IP). IP Version is 6 and the Protocol field is $3A_H$ (ICMP).
MLD_IPV6		Ethernet destination address is 33 33 xx xx xx xx_H. The Ether-Type field is $86DD_H$ (IP). IP Version is 6 and the Protocol field is $3A_H$ (ICMP).
Others	TYPE	The Ether-Type field matches one of the type filters.
	PROTOCOL	The Protocol field matches one of the protocol filters.
	TCPUDP	The TCP/UDP port number matches one of the TCP/UDP filters.
	MAC_CTRL	The Ether-Type field is 8808_H, but OPCODE is not 0001_H.

For learning purpose, Samurai-6I/6IX (ADM6996I/IX) sometimes divide Ethernet address into three groups.

Table 10 Packet Identification Groups

Packets Identified by Samurai-6I/6IX (ADM6996I/IX)	Comments
MULTICAST	The first bit of the Ethernet destination address is 1, but not all 1.
BROADCAST	The Ethernet destination address is FF FF FF FF FF FF_H.
UNICAST	The first bit of the Ethernet destination address is 0.

3.1.13.1 Span Packet

Samurai-6I/6IX (ADM6996I/IX) supports 4 Spanning Tree Port State (Disable, Blocking/Listening, Learning and Forwarding state) for every port to enable Spanning Tree Protocol functions when co-operating with an external CPU. These port states are defined in **STPS** of EEPROM register 0013_H ~ 0018_H.

Samurai-6I/6IX (ADM6996I/IX) supports a function to specify a packet to be treated as a Span Packet. Besides the Disable state, the Span Packets will not be droped by Spanning Tree Port State settings.

Table 11 Span Packet

Packet Type	Description
BPDU/**SLOW**/**PAE**/**RESER_R0**/ **RESER_R1**/**GXRP**/**RESER_R2**/ **RESER_R3**	The span packet is determined in priority order by: 1. Span bit defined in the Special TAG, when Span_Valid is set. 2. Span bit defined in the learning table when there is a match for DA+FID. 3. Span bit defined in the control table when there is a match for DA. 4. Span bit in register $003E_H$.
ARP/**RARP**	The span packet is determined in priority order by: 1. Span bit defined in the Special TAG, when Span_Valid is set. 2. Span bit in register $000D_H$.
IGMP_IP/**MLD_IP**/**MLD_IPV6**	The span packet is determined in priority order by: 1. Span bit defined in the Special TAG, when Span_Valid is set. 2. Span bit in register $000C_H$.
Others	The span packet is determined in priority order by: 1. Span bit defined in the Special TAG, when Span_Valid is set. 2. Span bit defined in the learning table when there is a match for DA+FID.If the first and second conditions are not satisfied, the frame is classified as non-span packets.

3.1.13.2 Management Packet

Samurai-6I/6IX (ADM6996I/IX) reserves some buffers for Management packets, so they are not dropped because of traffic congestion. Management packets are never limited by the bandwidth control, stormed by the storming control, or dropped due to **Smart Discard** function.

Table 12 Management Packet

Packet Type	Description
BPDU/**SLOW**/**PAE**/**RESER_R0**/ **RESER_R1**/**GXRP**/**RESER_R2**/ **RESER_R3**	The management packet is determined in priority order by: 1. Management bit defined in the Special TAG, when Management_Valid is set. 2. Management bit defined in the learning table when there is a match for DA+FID. 3. Management bit defined in the control table when there is a match for DA. 4. Management bit in register $003E_H$.
ARP/**RARP**	The management packet is determined in priority order by: 1. Management bit defined in the Special TAG, when Management_Valid is set. 2. Management bit in register $000D_H$.

Table 12 Management Packet (cont'd)

Packet Type	Description
IGMP_IP/MLD_IP/MLD_IPV6	The management packet is determined in priority order by: 1. Management bit defined in the Special TAG, when Management_Valid is set. 2. Management bit in register $000C_H$.
Others	The management packet is determined in priority order by: 1. Management bit defined in the Special TAG, when Management_Valid is set. 2. Management bit defined in the learning table when there is a match for DA+FID.If the first and second conditions are not satisfied, the frame is classified as non-management packets.

3.1.13.3 Cross_VLAN Packet

Cross-VLAN packets are defined to cross VLAN boundary or bypass the VLAN violation.

Table 13 Cross_VLAN Packet

Packet Type	Description
BPDU/SLOW/PAE/RESER_R0/ RESER_R1/GXRP/RESER_R2/ RESER_R3	The cross-VLAN packet is determined in priority order by: 1. Cross_VALN bit defined in the Special TAG, when Cross_VLAN_Valid is set. 2. Cross_VLAN bit defined in the learning table when there is a match for DA+FID. 3. Cross_VLAN bit defined in the control table when there is a match for DA. 4. Cross_VLAN bit in register $003E_H$.
ARP/RARP	The cross_VLAN packet is determined in priority order by: 1. Cross_VLAN bit defined in the Special TAG, when Cross_VLAN_Valid is set. 2. Cross-VLAN bit in register $000D_H$.
IGMP_IP/MLD_IP/MLD_IPV6	The cross_VLAN packet is determined in priority order by: 1. Cross-VLAN bit defined in the Special TAG, when Cross_VLAN_Valid is set. 2. Cross-VLAN bit in register $000C_H$.
Others	The Cross_VLAN packet is determined in priority order by: 1. Cross_VLAN bit defined in the Special TAG, when Cross_VLAN_Valid is set. 2. Cross_VLAN bit defined in the learning table when there is a match for DA+FID.If the first and second conditions are not satisfied, the frame is classified as non-cross_VLAN packets.

3.1.14 Tagged VLAN or Port VLAN

The difference between two VLAN rules allows searching of the VLAN boundary. Users can enable the "TAG Based VLAN" (see 0011_H, **TBV**) bit to instruct Samurai-6I/6IX (ADM6996I/IX) to operate in the Tagged VLAN mode.

3.1.14.1 VLAN Filters

Samurai-6I/6IX (ADM6996I/IX) supports 16 VLAN filters, each specifying a Valid bit, a TAG PRI, a VID, a FID, a Tagged Member, and a Member.

Table 14 VLAN Filters

VLAN Filter 0	VLAN_Valid	VLAN_PRI[2:0]	VID[11:0]	FID[3:0]	Tagged Member[5:0]	Member[5:0]
~						
VLAN Filter 15						

3.1.14.2 Port VLAN

Port VLANs are created by grouping individual physical ports together. In this mode, only 6 VLAN filters (VLAN filter 0 ~5) are used. During the time examining the received frame, the source port is used as an index to search the VLAN filter. If the source port is port 0, then Member in the filter 0 is the VLAN group that port 0 joins.

3.1.14.3 Tagged VLAN

Tagged VLAN is created with the aids of the VID in the packet or VID assigned by the source port. This VID is compared with 16 VIDs in the VLAN filters to check if any match exists. The Member in this matched filter is the VLAN boundary for the packet.

3.1.14.4 VID for Comparison and Carried through Samurai-6I/6IX (ADM6996I/IX)

VID for comparison and carried through Samurai-6I/6IX (ADM6996I/IX) (as egress VID) depends on the VLAN configuration.

VID0: The incoming packet is tagged with VID = 000_H. Enable “Replace VID0” (see $000A_H$, **RVID0**) to replace the Null VID with PVID (see basic control registers) if necessary.

VID1: The incoming packet is tagged with VID = 001_H. Enable “Replace VID1” (see $000A_H$, **RVID1**) to replace VID1 with PVID (see basic control registers) if necessary.

VIDFFF: The incoming packet is tagged with VID = FFF_H. Enable “Replace VIDFFF” (see $000A_H$, **RVIDFFF**) to replace VIDFFF with PVID (see basic control registers) if necessary.

VLAN Security Samurai-6I/6IX (ADM6996I/IX) ignores a packet’s VID and always uses PVID to see if there is a match and transfers it to the output ports. Disable the “VLAN Security Disable” (See 0022_H, **VSD**) to achieve this goal.

Input Force No Tag When enabled (see 0020_H, **IFNTE**), Samurai-6I/6IX (ADM6996I/IX) assumes all the packets are untagged and PVID is used. Input Force No Tag and VLAN Security are different in some situations.

Table 15 VID Comparison

Parameter	Tagged Frame with VID = 12’hfff	Packet Transmitted Tagged
VLAN Security	The frame is recorded as a VLAN violation and discarded if VIDFFF is not replaced.	Output packets have only one VLAN tag.
Input Force No Tag	The frame is recognized as an untagged frame. PVID is carried with this packet to the output port.	Output packets may have double tags, because the packet is transmitted with an additional tag with PVID.

3.1.14.5 Admit Only VLAN-Tagged Packets

Samurai-6I/6IX (ADM6996I/IX) supports a function to check if the packet is VLAN-Tagged, and any packets received on that port that carries no VID (untagged packets or packets with VID = 0) are discarded and recorded as a VLAN violation. This feature is implemented by programming the “Admit Only VLAN-Tagged” (see 0027_H, **AOVTP**).

Samurai-6I/6IX (ADM6996I/IX) assumes all the packets are untagged in the “Input Force No Tag” mode and users should care that in this situation, “Admit Only VLAN Tagged” is of no effect.

3.1.14.6 VID Check

In Tagged VLAN, the VID for comparison must be contained in the VLAN filters, or the packet received on the port will be dropped and recorded as a VLAN violation. This feature is disabled by programming the “VID CHECK” bit to 0 (see 0026_H, **VC**) to forward these packets instead of dropping them.

3.1.14.7 FID and VLAN Boundary

In Samurai-6I/6IX (ADM6996I/IX), every incoming packet is associated with an FID group. Samurai-6I/6IX (ADM6996I/IX) searches the learning table for the FID + DA, FID + SA. VLAN boundary restricts the allowable destination ports.

Table 16 FID Search Algorithm

Port VLAN	The source port number is the VLAN filter index. We can find FID in this filter.		
Tagged VLAN	VID match	Fid is contained in the matched filter. We can find FID in this filter.	
	VID un-match	VID check	The frame is dropped.
		VID uncheck	Default FID is the FID (see $000A_H$, **DFID**). If users configure Samurai-6I/6IX (ADM6996I/IX) back to port VLAN (see 0027_H, **BPV**), we can find the FID in the same way as the Port VLAN. When this feature is enabled, VLAN filter 0 ~ 5 are for Port VLAN purpose and VLAN filter 6 ~15 are for VID comparison.

Table 17 VLAN Boundary Search Algorithm

Port VLAN	The source port number is the VLAN filter index. We can find the boundary in this filter.		
Tagged VLAN	VID match	Member is contained in the matched filter. We can find the boundary in this filter	
	VID un-match	VID check	The frame is dropped.
		VID uncheck	Samurai-6I/6IX (ADM6996I/IX) uses Default VLAN Portmap as the boundary (see $003A_H$, **DVM**). If users configure Samurai-6I/6IX (ADM6996I/IX) to “Back to Port VLAN” (see 0027_H, **BPV**), boundary can be found in the same way as the Port VLAN. When this feature is enabled, VLAN filter 0 ~ 5 are for Port VLAN purpose and VLAN filter 6 ~15 are for VID comparison.

3.1.14.8 Ingress Filter

If the source port is not contained in the VLAN boundary associated with the incoming packet, then this frame is dropped and recorded as a VLAN violation. This feature is disabled by setting the “Ingress Filter” (see 0021_H, **IFE**) bit to 0_B.

3.1.14.9 VLAN Violation

When packets are recorded as a VLAN violation packet, Samurai-6I/6IX (ADM6996I/IX) will drop them. The only way to ignore these violations is to classify these packets as cross_VLAN packets.

3.1.14.10 TXTAG Carried through Samurai-6I/6IX (ADM6996I/IX)

Each packet during receive is assigned a 2-bit TXTAG value. This value is carried by Samurai-6I/6IX (ADM6996I/IX) to the output ports to help to determine if egress tagged is necessary.

Table 18 TXTAG Carried through Samurai-6I/6IX (ADM6996I/IX)

Packet Type	Description
BPDU/SLOW/PAE/RESER_R0/ RESER_R1/GXRP/RESER_R2/ RESER_R3	The TXTAG is determined in priority order by: 1. TXTAG in Special Tag with TXTAG_Valid enabled. 2. TXTAG in the learning table when there is a match for DA+FID in the learning table. 3. TXTAG in the control table when there is a match for DA in the control table. 4. TXTAG defined in register $003E_H$.
ARP/RARP	The TXTAG is determined in priority order by: 1. TXTAG in Special Tag with TXTAG_Valid enabled. 2. TXTAG is defined in $000D_H$.
IGMP_IP/MLD_IP/MLD_IPV6	The TXTAG is determined in priority order by: 1. TXTAG in Special Tag with TXTAG_Valid enabled. 2. TXTAG is defined in $000C_H$.
Other	The TXTAG is determined in priority order by: 1. TXTAG in Special Tag with TXTAG_Valid enabled. 2. The DA + FID matches an entry in the learning table with TXTAG defined.If the first and second conditions are not satisfied, TXTAG is 2'b00.

3.1.14.11 Tagged Member Carried through Samurai-6I/6IX (ADM6996I/IX)

If the output port is a tagged port it is determined by the port or the VID. Ports in the tagged members should egress packets tagged.

First Way: New Transmit Tag Disable (see 0x000ah)			
The "Output Packet Tagging" bit in the basic control registers determines the tagged members.			
Second Way: New Transmit Tag Enable (see 0x000ah)			
Port VLAN	The source port number is the VLAN filter index. We can find the tagged member in this filter.		
Tagged VLAN	VID match	Tagged members are contained in the matched VLAN filter. We can find the tagged members in this filter	
	VID un-match	VID check	The frame is dropped.
		VID uncheck	Samurai-6I/6IX (ADM6996I/IX) uses the first way to determine the tagged members. If users configure Samurai-6I/6IX (ADM6996I/IX) to "Back to Port VLAN" (see 0027_H, **BPV**), we can back to find the tagged members in the same way as the Port VLAN.

Users should note that when the Special Tag with Tagged Member Valid = 1_B is incoming, the Samurai-6I/6IX (ADM6996I/IX) always uses Tagged Member in the Special Tag as the Tagged Member.

3.1.14.12 Egress Tag Rule

On the receiving port, Samurai-6I/6IX (ADM6996I/IX) will attach each packet with the tagged members by the Ingress rule. When the packet reaches the destination port, Samurai-6I/6IX (ADM6996I/IX) will check if the destination port is a tagged member, if yes, the packet will be transmitted tagged.

Table 19 Egress Tag Result

Untagged packets are received (If Input Force No Tag is enabled, Samurai-6I/6IX (ADM6996I/IX) assumes all the received packets are untagged.)	Output port is in the tagged members carried with the packet.	TXTAG Description 00_B System Default Tag. Packets are transmitted tagged. 01_B Unmodified. Packets are transmitted untagged. 10_B Always Tagged. Packets are transmitted tagged. 11_B Always Untagged. Packets are transmitted untagged.
	Output port is not in the tagged members carried with the packet.	TXTAG Description 00_B System Default Tag. Packets are transmitted untagged. 01_B Unmodified. Packets are transmitted untagged. 10_B Always Tagged. Packets are transmitted tagged. 11_B Always Untagged. Packets are transmitted untagged.
	Output port is configured to operate in the bypass mode. See $002A_H$.	TXTAG Description 00_B System Default Tag. Packets are transmitted untagged. 01_B Unmodified. Packets are transmitted untagged. 10_B Always Tagged. Packets are transmitted tagged. 11_B Always Untagged. Packets are transmitted untagged.
Tagged packets are received.	Output port is in the tagged members carried with the packet.	TXTAG Description 00_B System Default Tag. Packets are transmitted tagged. 01_B Unmodified. Packets are transmitted tagged. 10_B Always Tagged. Packets are transmitted tagged. 11_B Always Untagged. Packets are transmitted untagged.
	Output port is not in the tagged members carried with the packet.	TXTAG Description 00_B System Default Tag. Packets are transmitted untagged. 01_B Unmodified. Packets are transmitted tagged. 10_B Always Tagged. Packets are transmitted tagged. 11_B Always Untagged. Packets are transmitted untagged.
	Output port is configured to operate in the bypass mode. See $002A_H$.	TXTAG Description 00_B System Default Tag. Packets are transmitted tagged. 01_B Unmodified. Packets are transmitted tagged. 10_B Always Tagged. Packets are transmitted tagged. 11_B Always Untagged. Packets are transmitted untagged

3.1.14.13 Tagged PRI Carried through Samurai-6I/6IX (ADM6996I/IX)

Table 20 Tagged PRI Carried

Untagged packets are received (If Input Force No Tag is enabled, Samurai-6I/6IX (ADM6996I/IX) assumes all the received packets are untagged.)	Port VLAN	[Change Priority Enable, Change Rule] (see $000A_H$,**PCE**&**PCR**) $0x_B$ Reverse PRI. 10_B VLAN_PRI field in the matched VLAN filter. 11_B Reverse PRI	
	Tagged VLAN	VID unmatch	Reverse PRI
		VID match	[Change Priority Enable, Change Rule] (see $000A_H$,**PCE**&**PCR**) $0x_B$ Reverse PRI. 10_B VLAN_PRI field in the matched VLAN filter. 11_B Reverse PRI
Tagged packets are received.	Port VLAN	[Change Priority Enable, Change Rule] (see $000A_H$,**PCE**&**PCR**) $0x_B$ Tagged PRI = The 3-bit user priority in the tag header. 10_B VLAN_PRI field in the matched VLAN filter. 11_B Reverse PRI	
	Tagged VLAN	VID un-match	Change Priority Enable (see $000A_H$,**PCE**) 0_B Tagged PRI = The 3-bit user priority in the tag header. 1_B Reverse PRI.
		VID match	[Change Priority Enable, Change Rule] (see $000A_H$,**PCE**&**PCR**) $0x_B$ Tagged PRI = The 3-bit user priority in the tag header. 10_B VLAN_PRI field in the matched VLAN filter. 11_B Reverse PRI
Reserve PRI is reversed from the priority queue the packet is switched through. Compare = {queue, queue, queue, queue, queue, queue, queue, queue} XOR VLAN Priority MAP in $000E_H$. Then we get Tagged PRI. Compare Tagged PRI $XXXX\_XXX0_B = 000_B$ $XXXX\_XX01_B = 001_B$ $XXXX\_X011_B = 010_B$ $XXXX\_0111_B = 011_B$ $XXX0\_1111_B = 100_B$ $XX01\_1111_B = 101_B$ $X011\_1111_B = 110_B$ $0111\_1111_B = 111_B$ $1111\_1111_B = 000_B$			

3.1.14.14 CFI Carried through Samurai-6I/6IX (ADM6996I/IX)

Table 21 CFI Carried

CFI Carried	
Untagged frames received (If Input Force No Tag is enabled, Samurai-6I/6IX (ADM6996I/IX) assumes all the received packets are untagged.)	CFI Carried = 0_B
Tagged frame received	CFI Carried = Original CFI in the tag header.

3.1.14.15 Egress TAG

Egress tag contains Egress PRI, Egress CFI, and Egress VID. When packets are transmitted tagged, this egress tag associated with Ethernet-Type = 8100_H is inserted following the Ethernet source address.

Egress PRI: Egress PRI is Tagged PRI carried through Samurai-6I/6IX (ADM6996I/IX) from the source port.

Egress CFI: Egress CFI is CFI carried through Samurai-6I/6IX (ADM6996I/IX) from the source port.

Egress VID: Egress VID is VID carried through Samurai-6I/6IX (ADM6996I/IX) from the source port.

3.1.15 Priority Queue

Samurai-6I/6IX (ADM6996I/IX) supports 4 priority queues and each is assigned a weight.

Table 22 Priority Queue

Queue	Weight
Queue 0	Weight = 1
Queue 1	Weight = “Queue 1 Weight” bits in 0025_H
Queue 2	Weight = “Queue 2 Weight” bits in 0026_H
Queue 3	Weight = “Queue 3 Weight” bits in 0027_H

3.1.15.1 System PRI

The system PRI is determined in the order as follows:

1. (DA+FID) was found in the learning table, then LRN_PRI field (when LRN_PRIEN is set) in this entry indicates the priority queue.
2. Port PRI in basic control register indicates the priority queue, when Port_PRIEN is enabled on that port.
3. The user priority field in the tag header is used for a tagged packet (“Input Force No Tag” doesn’t effect Samurai-6I/6IX (ADM6996I/IX) to extract the PRI in the tag header), when “VLAN Priority” is enabled. The user priority in the tag header is a 3-bits field, Samurai-6I/6IX (ADM6996I/IX) uses “VLAN Priority MAP” to map the priority queue.
4. For IP packets with no tag header, IP PRI is used when “Service Priority” (see $001F_H$) is enabled. Even for a tagged packet with IP header, we can set “IP over VLAN” (see basic control registers) bit to 1 to force using IP PRI. Three kinds of IP PRI are available.
   a) For IPV6 packets with IP Version = 6_H, the most significant 6 bits of the traffic class in the IPV6 header is used to map the priority queue by the service mapping registers.
   b) For IPV4 packets with IP Version = 4_H, the most significant 3 bits of the TOS field in the IPV4 header is used to map the priority queue by the TOS Priority Map register.
   c) If “TOS Using” (see $000A_H$) is disabled, even for IPV4 packets, Samurai-6I/6IX (ADM6996I/IX) uses the most significant 6 bits of the TOS field to map the priority queue by the service mapping registers.
5. If the packet matches the TCP/UDP filters, the PRI associated with this filter indicates the priority queue when “TCP/UDP PRIEN” is set to 1 (see 0098_H). Users could enable “TCPUDP over IP” to force using the TCPUDP PRI when there is a match.

3.1.15.2 Queue Assigned

Table 23 Queue Assigned

Packets Identified by Samurai-6I/6IX (ADM6996I/IX)	The Order of Priority Assigned
BPDU/SLOW/PAE/RESER_R0/ RESER_R1/GXRP/RESER_R2/ RESER_R3	1. The PRI field with PRI_Valid = 1 in the Special TAG indicates the priority queue. 2. If (DA+FID) matches an entry in the learning table, then LRN_PRI field with LRN_PRIEN enabled in this entry indicates the priority queue. 3. Use PRI in $003D_H$ to indicate the queue the frame was switched.
ARP/RARP	1. The PRI field with PRI_Valid = 1 in the Special TAG indicates the priority queue. 2. Use PRI in $000D_H$ to indicate the priority queue when enabled. 3. Use System PRI.
IGMP_IP/MLD_IP/MLD_IPV6	1. The PRI field with PRI_Valid = 1 in the Special TAG indicates the priority queue. 2. Use PRI in $000C_H$ to indicate the priority queue when enabled. 3. Use System PRI.
Others	1. The PRI field with PRI_Valid = 1 in the Special TAG indicates the priority queue. 2. Use System PRI.

3.1.15.3 Configure Samurai QoS Function

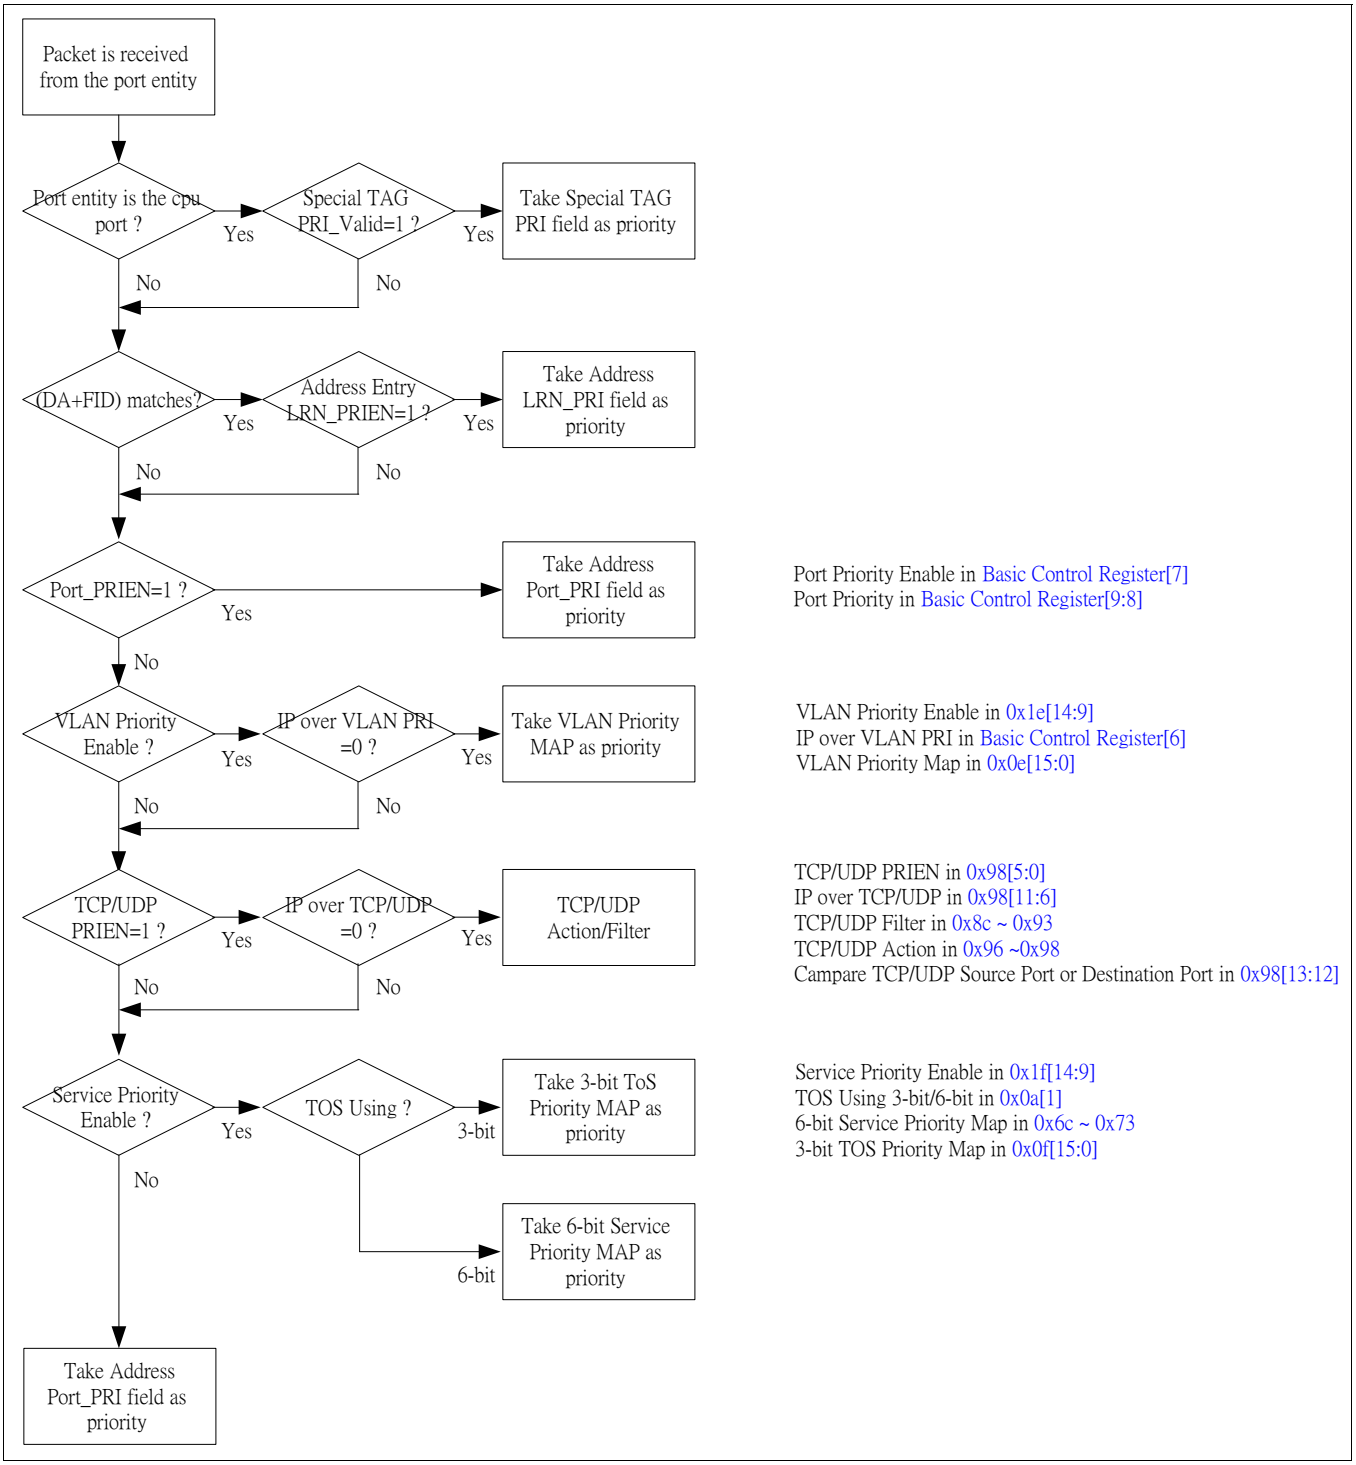

Figure 5 To Configure Samurai QoS function

3.1.16 Address Learning

Samurai-6I/6IX (ADM6996I/IX) provides two ways to create an entry in the address table: dynamic learning and manual learning. A four-way hash algorithm is implemented to allow the maximum of 4 different addresses with

the same hash key to be stored at the same time. Up to 2k entries can be created and all entries are stored in the internal SSRAM. Samurai-6I/6IX (ADM6996I/IX) searches the learning table for the SA+FID of the incoming packet or the instruction from CPU. When both fields (a single SA may exist in different FID) are matched, there is a match.

3.1.16.1 Dynamic Learning

The Samurai-6I/6IX (ADM6996I/IX) searches for SA and FID of an incoming packet in the address table and takes dynamic learning action as follows:

1. If (SA+FID) was not found in the learning table, create a new entry with SA, FID, and the incoming port.
2. If (SA+FID) was found in the learning table, and the incoming port and the Portmap don't match, create a new entry with SA, FID, and the incoming port.

Dynamic learning will be disabled in the following condition:

1. Security violation exists on the port.
2. VLAN violation exists on the port.
3. The packet is a PAUSE packet.
4. The number of the addresses that port has learned has reached its maximum.
5. The port disables its learning function (see extended control registers).
6. The packet is an illegal packet (too long, too short or FCS error).
7. A packet with Special Tag is received and the LRN bit is 0 and LRN_Valid = 1_B.
8. The port is in the Disabled state in the Spanning Tree Protocol.
9. The port is in the Blocking/Listening state in the Spanning Tree Protocol.
10. All the four entries in the same hash address are occupied and all of them are static addresses.

3.1.16.2 Manual Learning

The Samurai-6I/6IX (ADM6996I/IX) implements the manual learning with the CPU's help. The CPU can create or remove any entry in the address table. Each entry could be static or not. "Static" means the entry will not be aged forever. When the entry is static, then the definition in some fields is modified to make Samurai-6I/6IX (ADM6996I/IX) work more flexibly.

3.1.16.3 Learning Table

3.1.16.3.1 Entry Format in the Learning Table

69	68	67	66 … 58	57 … 52	51 … 48	47 … 0
Bad	Info_Type	Occupy	Info_Ctrl/Age Timer	Portmap	FID	Address

Field	Description
Bad	The entry is marked to show if it is failed during the learning table memory bist time. 0_B Doesn't fail 1_B Fail
Info_Type	Static Address. 0_B The entry is not static 1_B The entry is static

Field	Description	
Occupy	The entry is marked to show the status if the entry is occupied. 0_B Don't occupy 1_B Occupy	
Info_Ctrl/Age Timer	Info_Ctrl is used when the entry is static.	
	Bit	Description
	8	Source Intrusion 0_B It isn't a violated source address 1_B It is a violated source address
	7	Span 0_B Not span packet 1_B A span packet
	6	Management 0_B Not a management packet 1_B A management packet
	5	Cross_VLAN 0 = Not a cross_VLAN packet. 1 = A cross_VLAN packet.
	4:3	TXTAG It is used as an option for inserting Tag on the transmission port. 00_B System Default Tag 01_B Unmodified 10_B Always Tagged 11_B Always Untagged
	2	LRN_PRIEN 0_B LRN_PRI is not used 1_B LRN_PRI is used
	1:0	LRN_PRI It identified the address priority. 00_B Queue 0 01_B Queue 1 10_B Queue 2 11_B Queue 3
	Age Timer is used when the entry is not static.	
	Bit	Description
	8:0	Age Timer This timer is used to control the ageing time.
Portmap	The field is used as the output ports associated with the FID+MAC Address.	
FID	The field is used as the FID group associated with the MAC address.	
Address	The MAC Address in the learning table.	

3.1.16.3.2 The Registers Accessing the Learning Table

12 registers are provided by Samurai-6I/6IX (ADM6996I/IX) to support access to the address table. These 12 registers are Address Table Control Register 0 ~ 5 and Address Table Status Register 0 ~ 5 in $011A_H$ ~ 0125_H.

Table 24 Control Register Description for accessing the address table

Command	Access Control	Info_Type	Info_Ctrl/Age Timer	Portmap	FID	Address
Control 5[6:4]	Control 5[3:0]	Control 4[12]	Control 4[8:0]	Control 3[9:4]	Control 3[3:0]	{Control 2, Control 1, Control 0}

The Address, FID, Portmap, Info_Ctrl/Age Timer and Info_Type in the Control Register have the same meaning as those in the entry format. The Command and Access Control is described as follows:

Table 25 Description for Command and Access Control

Command	Access Control	Description
000_B	0111_B	Create a new address
000_B	1111_B	Overwrite an existed address
001_B	1111_B	Erase an existed address
010_B	0000_B	Search an empty address
010_B	1001_B	Search by the port in the Output Port field
010_B	1010_B	Search by the forwarding group specified in the Forwarding Group field
010_B	1100_B	Search by the address specified in the MAC Address field
010_B	1110_B	Search by the address and forwarding group
010_B	1101_B	Search by the address and output port
010_B	1011_B	Search by the forwarding group and the output port
010_B	1111_B	Search by the address, the forwarding group and the output port
011_B	0100_B	Initial to location by the address field
011_B	0000_B	Initial to the first address

Table 26 Status Register Description

Busy	Result	Bad	Occupy	Info_Type	Info_Ctrl/ Age_Time	Portmap	FID	Address
Status 5 [15]	Status 5 [14:12]	Status 5 [2]	Status 5 [1]	Status 5 [0]	Status 4 [8:0]	Status 3 [9:4]	Status 3 [3:0]	{Status 2, Status 1, Status 0}

Table 27 Description for the Status Register

Address	After the search operation is successful, the switch will return the MAC address in this field. If the search fails, this field doesn't mean anything.
FID	After the search operation is successful, the switch will return FID in the matched entry.
Portmap	After the search operation is successful, the switch will return Portmap in the entry.
Info_Ctrl/ Age Time	After the search operation is successful, the switch will return Info_Ctrl/Age Timer in the entry.
Info_Type	After the search operation is successful, the switch will return Info_Type in the entry
Occupy	After the search operation is successful, the switch will return Occupy in the entry
Bad	After the search operation is successful, the switch will return Bad in the entry

Table 27 Description for the Status Register (cont'd)

Result	This field tells us the status for not only the search operation but also the creating operation. 000_B Command OK 001_B All Entries Used. This result happens only for the create operation. Samurai-6I/6IX (ADM6996I/IX) uses the 4-way address lookup engine so it allows 4 different addresses stored at each hash location. If these 4 entries are all static, then CPU will not successfully create the 5th different address hashed to the same location and 001 will be returned. The only way to create 5th different address is to remove one of early addresses. 101_B Command Error
Busy	This bit indicates if the table engine for access is available. 1_B The engine is busy and it will not accept the command from the CPU. 0_B The engine is available.

3.1.16.3.3 Rules to Access the Learning Table

1. Check the Busy Bit in the status register to see if the access engine is available. If the engine is busy, wait until the engine is free. If the engine is available, go to the following step.
2. Write the MAC address[15:0] into the control register 0.
3. Write the MAC address[31:16] into the control register 1.
4. Write the MAC address[47:32] into the control register 2.
5. Write the Portmap and FID into the control register 3.
6. Write the Info_Ctrl/Age Timer and Info_Type into the control register 4.
7. Write the Access Control and Command into the control register 5 to define the operation.
8. Wait for the engine to complete (Check the Busy Bit).
9. Read the desired result returned in the status register.

Note: Before a new search starts, the CPU should execute the "Initial command" to initialise the search pointer. The search engine can search the aim from the top to bottom. The search engine has the ability to automatically move the pointer to an associated location (The result will be returned). Because more than one entry may match the search condition (by port, by address, etc) at the same time, the CPU should continue to restart the search engine until the Command Result = Entry Not is found to confirm that no other matching entries exist and at this time a new search can start.

3.1.16.3.4 Example

Example	Rule
The user needs Samurai-6I/6IX (ADM6996I/IX) to forward the specified unicast packet (DA = 0012-3456-789A$_H$ and FID = 2) to port 3 forever.	1. Check the Busy bit. If Busy = 0_B, go to the next step. If Busy = 1_B, wait. 2. Write 789A$_H$ into control register 0. 3. Write 3456$_H$ into control register 1. 4. Write 0012$_H$ into control register 2. 5. Write 0082$_H$ into control register 3. 6. Write 1000$_H$ into control register 4. 7. Write 0007$_H$ into control register 5. 8. Read the status register 5 to check the busy bit. If Busy = 0_B, check the Command Result to see if the create operation is successful. If Busy = 1_B, wait
The user needs Samurai-6I/6IX (ADM6996I/IX) to forward the specified multicast packet (DA = 0123-4567-89AB$_H$ and FID = 3) to port 0, and port 1 both. This address could be aged.	1. Check the Busy bit. If Busy = 0_B, go to the next step. If Busy = 1_B, wait. 2. Write 89AB$_H$ into control register 0. 3. Write 3456$_H$ into control register 1. 4. Write 0123$_H$ into control register 2. 5. Write 0033$_H$ into control register 3. 6. Write 0000$_H$ into control register 4. 7. Write 0007$_H$ into control register 5. 8. Read the status register 5 to check the busy bit. If Busy = 0_B, check the Command Result to see if the create operation is successful. If Busy = 1_B, wait
The user wants to know how many stations attached to port 4	1. Check the Busy bit. If Busy = 0_B, go to the next step. If Busy = 1_B, wait. 2. Write 0030$_H$ into control register 5 to initial the search pointer to the first address. 3. Wait until the Busy bit changes to 0_B. 4. Write 0100$_H$ into the control register 3. 5. Write 0029$_H$ into the control register 5 to start the operation of the search by port. 6. Read the status register 5 to check the busy bit. If Busy = 0_B, check the Command Result to see if the search operation is successful (the Mac address attached to port 4 could be derived from the MAC address in the status register). If Busy = 1_B, wait for completion. 7. If Command Result = "Command OK", it means some other MAC addresses attached to port 4 may exist. We should restart the "Search by port" command again to let the search engine to look another addresses. 8. If the Command Result = "Entry Not Found", it means no other addresses attached to port 4 exist.

3.1.17 Address Aging

Samurai-6I/6IX (ADM6996I/IX) maintains an age timer for each address. The aging timer is reset to 0 when the packet is received. When aging time counts up to 300 seconds, it means that this station didn't transmit packets for this period and the address can be removed from the table. This could help to prevent a station leaves the network and occupies a table space for a long time. Aging function can be disabled from the EEPROM (see extend control registers). If the address is static, Samurai-6I/6IX (ADM6996I/IX) doesn't age it out also. The default aging timer is 300 seconds. User could change Aging Timer Select (0011$_H$, **ATS**) to shorten the aging time.

3.1.18 Hardware Based IGMP Snooping

Samurai-6I/6IX (ADM6996I/IX) supports IGMP v1/v2 Snooping without any software effort. Samurai-6I/6IX (ADM6996I/IX) will monitor the IGMP traffic and update its embedded IGMP membership table if the hardware based IGMP snooping function is enabled. IP multicast frames can be forwarded according to the Port-Map

information of the membership table. The data of the membership can also be accessed by the CPU via SDC/SDIO interface. The following registers could be used to configure the IGMP Snooping behavior.

1. EEPROM register $00B_H$ bit [13:12], Additional Snooping Control register.ports.
2. EEPROM register $00B_H$ bit [2], Source Violation Over Snooping.
3. EEPROM register $00B_H$ bit [1], Source Violation Over Default.
4. EEPROM register $00C_H$ bit [13:6], various Snooping Control registers.
5. EEPROM register $00C_H$ bit [2], Hardware IGMP Packet Ignore CPU Port.
6. EEPROM register $00C_H$ bit [1], Hardware IGMP Snooping Enable.
7. EEPROM register $00C_H$ bit [0], Hardware IGMP Default Router Enable.
8. EEPROM register $00D_H$ bit [14], IP Multicast Packet Treated as Cross VLAN packet.
9. EEPROM register $01B_H$ bit [14:9], Multicast Port-Map.
10. EEPROM register $03F_H$ bit [15:8], Query Interval.
11. EEPROM register $03F_H$ bit [7:6], Robust Variable.
12. EEPROM register $03F_H$ bit [5:0], Default Router Port-Map.

3.1.18.1 Entry Format of IGMP Membership Table

57	56	55 ... 48	47 … 42	41 … 30	29	28... 23	22 ... 0
Bad	Occupy	Reserved	Reserved	Reserved	Reserved	Portmap	Group ID

Field	Description
Bad	The entry is marked to show if it is failed during the memory BIST time of IGMP membership table. 0_B Doesn't fail 1_B Fail
Occupy	The entry is marked to show the status if the entry is occupied. 0_B Empty Entry 1_B Occupied Entry
Reserved	Reserved. Ignore the content in reading and fill in 0 in writing.
Reserved	Reserved. Ignore the content in reading and fill in 0 in writing.
Reserved	Reserved. Ignore the content in reading and fill in 0 in writing.
Reserved	Reserved. Ignore the content in reading and fill in 0 in writing.
Portmap	This flag is used to denote whether the port is the member of this Group or not. 0_B The port is not the member of this Group. 1_B The port is the member of this Group.
Group ID	IP Multicast Group ID.

3.1.18.2 The Registers Accessing the IGMP Membership Table

The registers for accessing the IGMP membership table are the same with accessing MAC address filtering table, but the data format are re-defined as below.

Table 28 Control Register Description for Accessing the IGMP Membership Table

Command	Entry Address	Entry Data
Control 5[6:4]	Control 4[4:0]	{Control 3[9:0], Control 2, Control 1, Control 0}

The Command used to access IGMP membership table is defined as below.:

Table 29 Description for Command and Access Control

Command	Description
100_B	Write data into internal IGMP table
101_B	Read data from internal IGMP table

Table 30 Entry Format of IGMP Membership Table

Busy	Result	Entry Address	Entry Data
Status 5[15]	Status 5[14:12]	Status 4[4:0]	{Status 3[9:0], Status 2, Status 1, Status 0}

3.1.18.3 IGMP Snooping Introduction

IGMP snooping is a feature that allows the switch to “listen in” on the IGMP conversation between hosts and routers. When a switch hears an IGMP report from a host for a given multicast group, the switch adds the host's port number to the GDA (Group Destination Addresses) list for that group. And, when the switch hears an IGMP leave, it removes the host's port from the Multicast table entry.

Multicast Address

1. Multicast IP addresses are Class D IP addresses. Therefore, all IP addresses from 224.0.0.0 to 239.255.255.255 are multicast IP addresses. They are also referred to as Group Destination Addresses (GDA).

2. For each GDA there is an associated MAC address. This MAC address is formed by 01-00-5e, followed by the last 23 bits of the GDA translated in hex. Therefore:

- 230.20.20.20 corresponds to MAC 01-00-5e-14-14-14
- 224.10.10.10 corresponds to MAC 01-00-5e-0a-0a-0a

Consequently, this is not a one-to-one mapping, but a one-to-many mapping:

- 224.10.10.10 corresponds to MAC 01-00-5e-0a-0a-0a
- 226.10.10.10 corresponds to MAC 01-00-5e-0a-0a-0a, as well

3. Some Multicast IP addresses are reserved for special use. For example:

- 224.0.0.1 - All multicast-capable hosts.
- 224.0.0.2 - All multicast-capable routers
- 224.0.0.5 and 224.0.0.6 is used by: Open Shortest Path First (OSPF).

In general, addresses from 224.0.0.1 to 224.0.0.255 are reserved and used by various protocols.

IGMP

IGMP is a standard defined in RFC1112 for IGMPv1 and in RFC2236 for IGMPv2. It specifies how a host can register a router to receive specific multicast traffic.

IGMPv1

- **Membership Query** are issued by router at regular intervals to check whether there is still a host interested in the GDA in that segment.

Table 31 IPV4/IGMP/General Query

DA 01005e000001	SA 6 bytes	Type 16’h0800	Ver 4’h4	Len 4 bits	TOS 1 byte	Unused 7 bytes	Protocol 8’h02	Unused 6 bytes	DIP 224.0.0.1
Unused (Len*4-20) bytes	TP 8’h11	Unused 3 bytes	GA 32’b0						

- **Membership Report** is issued by hosts that want to receive a specific multicast group (GDA). Host membership reports are issued either unsolicited (when the host wants to receive GDA traffic first) or in response to a membership query.

Table 32 IPV4/IGMP/V1 Report

DA 01005exxxxxx	SA 6 bytes	Type 16'h0800	Ver 4'h4	Len 4 bits	TOS 1 byte	Unused 7 bytes	Protocol 8'h02	Unused 6 bytes	DIP 4 bytes
Unused (Len*4-20) bytes	TP 8'h12	Unused 3 bytes	GA 4 bytes						

Host membership queries are sent by router to the all multicast address: 224.0.0.1. These queries use 0.0.0.0 in the IGMP GDA field. A host for each group must respond to that query or the router will stop forwarding the traffic for that GDA to that segment (after 3 attempts). The router simply keeps a multicast routing entry for each source and links it to a list of outgoing interfaces (interface from where the IGMP report came). After three IGMP query attempts with no answer, this interface is erased from outgoing interface list for all entries linked to that GDA.

Note: IGMPv1 has no leave mechanism. If a host no longer wants to receive the traffic, it simply quits. If it is the last, the router will not have any answers to its query and will delete the GDA for that subnet.

IGMPv2

- Membership Query

Table 33 IPV4/IGMP/General Query

DA 01005e000001	SA 6 bytes	Type 16'h0800	Ver 4'h4	Len 4 bits	TOS 1 byte	Unused 7 bytes	Protocol 8'h02	Unused 6 bytes	DIP 224.0.0.1
Unused (Len*4-20) bytes	TP 8'h11	Unused 3 bytes	GA 32'b0						

- IGMPv1 Membership Report

Table 34 IPV4/IGMP/V1 Report

DA 01005exxxxxx	SA 6 bytes	Type 16'h0800	Ver 4'h4	Len 4 bits	TOS 1 byte	Unused 7 bytes	Protocol 8'h02	Unused 6 bytes	DIP 4 bytes
Unused (Len*4-20) bytes	TP 8'h12	Unused 3 bytes	GA 4 bytes						

- IGMPv2 Membership Report

Table 35 IPV4/IGMP/V2 Report

DA 01005exxxxxx	SA 6 bytes	Type 16'h0800	Ver 4'h4	Len 4 bits	TOS 1 byte	Unused 7 bytes	Protocol 8'h02	Unused 6 bytes	DIP 4 bytes
Unused (Len*4-20) bytes	TP 8'h16	Unused 3 bytes	GA 4 bytes						

- **Leave Group** when a host wants to leave a group, it should send a Leave Group IGMP message to destination 224.0.0.2 (instead of leaving silently like in IGMPv1)

Table 36 IPV4/IGMP/V2 Leave

DA 01005000002	SA 6 bytes	Type 16'h0800	Ver 4'h4	Len 4 bits	TOS 1 byte	Unused 7 bytes	Protocol 8'h02	Unused 6 bytes	DIP 224.0.0.2
Unused (Len*4-20) bytes	TP 8'h17	Unused 3 bytes	GA 4 bytes						

- **Group-specific Query** a router can now send a group-specific query by sending a Membership Query to the group GDA instead of sending it to 0.0.0.0

Table 37 IPV4/IGMP/Group-Specific Query

DA 01005exxxxxx	SA 6 bytes	Type 16'h0800	Ver 4'h4	Len 4 bits	TOS 1 byte	Unused 7 bytes	Protocol 8'h02	Unused 6 bytes	DIP 4 bytes
Unused (Len*4-20) bytes	TP 8'h11	Unused 3 bytes	GA 4 bytes						

Learning the Router Port

The switch listens to the following messages in order to detect router ports with IGMP snooping

- IGMP Membership query send to 01-00-5e-00-00-01

Once a router port is detected, it is added to the port list of all GDAs in that VLAN.

[Hardware IGMP Snooping]

1. Enable Hardware IGMP Snooping, set EEPROM register $0C_H$[1]=1
2. Hardware IGMP Default Router

- If EEPORM register $0C_H$[0]=0, Samurai will learn the router port automatically.

Note: The presence of the router port is configured by Query Interval (EEPROM register $3F_H$[15:8]) defined as the length of time that must pass before the Router Port decides there is no longer another multicast router which should be the querier.

- If EEPORM register $0C_H$[0]=1, Samurai will learn the router port according to the Default Router Port-map.
- If EEPROM register $3F_H$[5:0], Default Router Port-map

Note: The router port always exists even no IGMP query is received. The group membership is maintained by Robust Variable (EEPROM register $3F_H$[7:6]) defined as the amount of query that must pass before the Default Router decides there are no members of a group on a network.

Joining a Group with IGMP Snooping

Below are two joining scenarios.

Scenario A: Host A is the first host to join a group in the segment.

- Host A sends an unsolicited IGMP Membership report.
- The switch intercepts the IGMP membership report that sent by the host that wanted to join the group.
- The switch creates a multicast entry for that group and links it to the port on which it has received the report and to all router ports.
- The switch forwards the IGMP report on to all router ports. This is so that the router will also receive the IGMP report and will update its multicast routing table accordingly.

[Hardware IGMP Snooping]

Samurai supports 32 IGMP membership table. Samurai will maintain IGMP membership table according to IGMPv1/v2 protocol. If 32 IGMP membership table is full, the later incoming IGMP packets will follow “Multicast Port-map”.

User can use Address Table Control Register command and Address Table Status Register command to access 32 IGMP membership table.

Table 38 IGMP Membership Table

Address Table Control 0	EEPROM register $11A_H$	Address Table Status 0	EEPROM register 120_H
Address Table Control 1	EEPROM register $11B_H$	Address Table Status 1	EEPROM register 121_H
Address Table Control 2	EEPROM register $11C_H$	Address Table Status 2	EEPROM register 122_H
Address Table Control 3	EEPROM register $11D_H$	Address Table Status 3	EEPROM register 123_H
Address Table Control 4	EEPROM register $11E_H$	Address Table Status 4	EEPROM register 124_H
Address Table Control 5	EEPROM register $11F_H$	Address Table Status 5	EEPROM register 125_H

- IGMP membership table Read Command
  - (1) Check the **Busy** Bit in the **Status Register 5 [15]** to see if the access engine is available. If **Busy = 1_B**, wait until the engine is free. If **Busy = 0_B**, go to the following step.
  - (2) Write **Control Register 4 [4:0]** to assign the entry numbers you want to access.
  - (3) Write **Control Register 5 [6:4] = 101_B** to start the operation of Read command.
  - (4) Read the **Busy Bit** in the **Status Register 5 [15]** to see if the operation is successful. If **Busy = 1_B**, wait until the operation is completed. If **Busy = 0_B**, read **Status Register 5 ~ 0** to get the IGMP membership table entry.
- IGMP membership table Write Command
  - (1) Check the **Busy** Bit in the **Status Register 5 [15]** to see if the access engine is available. If **Busy = 1_B**, wait until the engine is free. If **Busy = 0_B**, go to the following step.
  - (2) Write **Control Register 0 ~ 4** to assign the entry numbers you want to access.
  - (3) Write **Control Register 5 [6:4] = 100_B** to start the operation of Write command.
  - (4) Read the **Busy** Bit in the **Status Register 5 [15]** to see if the operation is successful. If **Busy = 1_B**, wait until the operation is completed. If **Busy = 0_B**, read **Status Register 5 ~ 0** to get the IGMP membership table entry.

3.1.19 Source Violation

Source violation is defined in Samurai-6I/6IX (ADM6996I/IX) to support flexible security modes. See Security Option in the EEPROM Basic Register and the Src_Violation bit in the Learning Table.

Security Mode	Description
First Lock	Samurai-6I/6IX (ADM6996I/IX) locks the first SA+FID of packets received on the port. After the first (SA+FID) is locked, Samurai-6I/6IX (ADM6996I/IX) starts to check packets with different (SA+FID). 1. If the packets are not assigned as management, drop them (modify the forwarding algorithm) and record as a source violation. 2. If the packets are management packets, and Source Violation (see $000B_H$, **System Control Register 1**) is configured to 1_B for different kinds of packets, then Samurai-6I/6IX (ADM6996I/IX) modifies the forwarding algorithm to drop these packets. They are also recorded as a source violation. 3. If the packets are management packets and Source Violation is configured to 0_B, then Samurai-6I/6IX (ADM6996I/IX) doesn't modify the forwarding algorithm. In this situation, we don't record this case as a source violation.
First Link Lock	The first received packets will be locked as First Lock. The difference is that the receiving port will not receive and learn packets any more after the port links down even if it links up again. A source violation is recorded as the First Lock. If Samurai-6I/6IX (ADM6996I/IX) modifies the forwarding algorithm is still as the First Lock.
Assign Lock	Samurai-6I/6IX (ADM6996I/IX) allows users to assign the locked SA+FID through CPU's help instead of the first SA+FID. A source violation is recorded as the First Lock. If Samurai-6I/6IX (ADM6996I/IX) modifies the forwarding algorithm is still as the First Lock.
Assign Link Lock	Samurai-6I/6IX (ADM6996I/IX) allows users to assign the locked SA+FID through CPU's help instead of the first SA+FID. The others are the same as First Link Lock.
Discard Unknown	The "unknown source address" means that (SA+FID) is not found in the learning table or even is found but Portmap doesn't match the incoming port. If "unknown" packets are received, Samurai-6I/6IX (ADM6996I/IX) records the source violation as the First Lock. The rule to modify the forwarding algorithm is still as the First Lock.
Unknown to CPU	This option is the same as "Discard Unknown" except that if Samurai-6I/6IX (ADM6996I/IX) decides to modify the forwarding algorithm, it will forward the packets to the CPU port instead of dropping them.
Source Intrusion	If the incoming port receives the packets with SA is marked as Source Intrusion, we handle these packets in the following rule: 1. Enable Source Intrusion Must (see $000B_H$, **SIM**) to instruct Samurai-6I/6IX (ADM6996I/IX) to modify the forwarding algorithm and record the source violation always. 2. If Source Intrusion Must is not enabled, Samurai-6I/6IX (ADM6996I/IX) also modifies the forwarding algorithm and records the source violation when any non-management packets are received. 3. If Source Intrusion Must is not enabled, Samurai-6I/6IX (ADM6996I/IX) also modifies the forwarding algorithm and records the source violation when amanagement packets are received but Source Violation is configured to 1_B. 4. If Source Intrusion Must is not enabled, Samurai-6I/6IX (ADM6996I/IX) doesn't modify the forwarding algorithm and records the source violation when management packets are received and Source Violation is configured to 0_B. Samurai-6I/6IX (ADM6996I/IX) allows the users to redirect the packets to the CPU port instead of dropping it when they violate the source intrusion (see Source Intrusion Action in $000B_H$, **SIA**).

Samurai-6I/6IX (ADM6996I/IX) supports stricter security protection. The port is disabled when there is a source violation. Enable Security Option[3] to enable this feature.

3.1.20 Packet Forwarding

Samurai-6I/6IX (ADM6996I/IX) identifies a packet header and transfers it from the incoming port to the destination ports.

3.1.20.1 Control Table

Samurai-6I/6IX (ADM6996I/IX) provides a control table for users to control the forwarding algorithm of the DA = 01 80 C2 00 00 00_H ~ DA = 01 80 C2 00 00 $2F_H$ easily. This control table is defined in 0074_H ~ $008B_H$.

3.1.20.2 Default Output Ports

The default output ports that a packet is transferred to are determined in the following order.

1. The Portmap in the Special Tag with Portmap_Valid = 1 is used as the output ports.
2. The Portmap in the learning table is used as the output ports, when (DA+FID) matches an entry in the learning table.
3. The Portmap in the hardware IGMP table is used as the output ports, when DA matches an entry in the hardware IGMP table and “Hardware IGMP Snooping” (see $000C_H$, **HISE**) is enabled.
4. “Broadcast Portmap” (see $001A_H$, **BP**) is used as the output ports, when the incoming packet is a broadcast packet.
5. “Multicast Portmap” (see $001B_H$, **MP**) is used as the output ports, when the incoming packet is a multicast packet.
6. “Unicast Portmap” (see 0019_H, **UP**) is used as the output ports, when the incoming packet is a unicast packet.

3.1.20.3 Forwarding Algorithm

Table 39 Forwarding Algorithm

Packets Identified by Samurai-6I/6IX (ADM6996I/IX)	Algorithm
BPDU/SLOW/PAE/RESER_R0/ RESER_R1/GXRP/RESER_R2/ RESER_R3	IF (Portmap_Valid in the Special Tag is 1), THEN use Portmap in the Special Tag as the output ports. ELSE IF ((DA+FID) matches an entry in the learning table)), THEN use the Portmap in the learning table as the output ports. ELSE IF (DA matches an entry in the control table), THEN the output ports are the Portmap in the table. ELSE the output ports are the intersection of the Pass Portmap (see $003D_H$ **New Reserve Address Control Register 0** and $003E_H$ **New Reserve Address Control Register 1**) and the “Reserve Portmap” in the EEPROM (see $001C_H$, **RP**)
ARP/RARP	IF (Portmap_Valid in the Special Tag is 1), THEN use Portmap in the Special Tag as the output ports. ELSE IF (ARP/RARP is trapped), THEN use ARP/RARP Portmap as the output ports. ELSE use “Default Output Ports” as the output ports.

Table 39 Forwarding Algorithm (cont'd)

Packets Identified by Samurai-6I/6IX (ADM6996I/IX)	Algorithm

IGMP_IP/MLD_IP/MLD_IPV6	IF (Portmap_Valid in the Special Tag is 1), THEN use Portmap in the Special Tag as the output ports.
	ELSE IF (Hardware IGMP Snooping is enabled),
	IF (Hardware IGMP Packet Ignore CPU Port is enabled),
	THEN forwards packets to Multicast Portmap but doesn't forward to the CPU port.
	Else forwards packets to Multicast Portmap.
	ELSE IF (IGMP_IP/MLD_IP/MLD_IPV6 is trapped), THEN use IGMP/IGMP_IP/MLD_IP/MLD_IPV6 Portmap as the output ports.
	ELSE use "Default Output Ports" as the output ports.

TYPE	IF (Portmap_Valid in the Special Tag is 1), THEN use Portmap in the Special Tag as the output ports. ELSE use Type Portmap as the output ports.
PROTOCOL	IF (Portmap_Valid in the Special Tag is 1), THEN use Portmap in the Special Tag as the output ports. ELSE use Protocol Portmap as the output ports.
TCPUDP	IF (Portmap_Valid in the Special Tag is 1), THEN use Portmap in the Special Tag as the output ports. ELSE use TCPUDP Portmap as the output ports.
MAC_CTRL	IF (Portmap_Valid in the Special Tag is 1), THEN use Portmap in the Special Tag as the output ports. ELSE use MAC CTRL Portmap as the output ports.
Others	Use "Default Output Ports" as the output ports

3.1.21 Special TAG

Special Tag is inserted after the Ethernet SA field to allow the CPU to tell the switch how to handle the packets it sends or to know the source port when the CPU receives a packet.

8 Bytes	Preamble
6 Bytes	DA
6 Bytes	SA
Byte 0	Special Tag 0
Byte 1	Special Tag 1
Byte 2	Special Tag 2
Byte 3	Special Tag 3
Byte 4	Special Tag 4
Byte 5	Special Tag 5
4 Bytes	VLAN Tag
6 Bytes	SNAP
2 Bytes	Type/Length
	Data
4 Bytes	CRC

3.1.21.1 Special Tag for the Receive

Users are allowed to enable Special TAG Receive (0011_H, **STRE**) function to instruct Samurai-6I/6IX (ADM6996I/IX) to check the Special Tag to see if this field contains any commands when packets are received on the CPU port.

Table 40 Special Tag for the Receive

Special TAG	Description
Byte 0	ADM Prefix 0.
Byte 1	ADM Prefix 1. When Special TAG Receive is enabled, Samurai-6I/6IX (ADM6996I/IX) will compare {ADM Prefix -, ADM Prefix 1} with ADM TAG Ether Type (see $002E_H$, **ATET**). If they are different, Special Tag is ignored. If they are the same, Samurai-6I/6IX (ADM6996I/IX) uses the Special Tag to make switching decisions.

3.1.21.2 Special Tag for the Transmit

Users are allowed to enable Special TAG Transmit (0011_H, **STTE**) functions to instruct Samurai-6I/6IX (ADM6996I/IX) to insert the Special Tag followed SA in the packets transmitted from the CPU port. Samurai-6I/6IX (ADM6996I/IX) also allows users to choose what kinds of packets they don't want to insert this Special Tag even when Special TAG Transmit (0011_H, **STTE**) function is enabled.

Table 41 Option for Special Tag Transmit

Packets Identified by Samurai-6I/6IX (ADM6996I/IX)	Condition	Result
BPDU/SLOW/PAE/RESER_R0/RESER_R1/GXRP/RESER_R2/RESER_R3	Special TAG Transmit = 0_B. or{Special TAG Transmit, Insert Reserve} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert Reserve} = 11_B.	Insert Special Tag on the CPU port.

	{Special TAG Transmit, Insert Protocol} = 11_B.	Insert Special Tag on the CPU port.
TCPUDP	Special TAG Transmit = 0_B. or{Special TAG Transmit, Insert TCP/UDP} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert TCP/UDP} = 11_B.	Insert Special Tag on the CPU port.
MAC_CTRL	Special TAG Transmit = 0_B. or{Special TAG Transmit, Insert MAC CTRL} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert MAC CTRL} = 11_B.	Insert Special Tag on the CPU port.

Table 41 Option for Special Tag Transmit (cont'd)

Packets Identified by Samurai-6I/6IX (ADM6996I/IX)	Condition	Result
Others	Special TAG Transmit = 0_B. or{Special TAG Transmit, Insert Default, Source Violation} = 100_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert Default, Source Violation} = 110_B. or{Special TAG Transmit, Insert Default, Source Violation} = 101_B .{Special TAG Transmit, Insert Default, Source Violation} = 111_B.	Insert Special Tag

Table 42 Special Tag for the Transmit

Special TAG	Description
Byte 0	ADM Prefix 0.
Byte 1	ADM Prefix 1.
Byte 2	Bit [7]: Source Violation. 1 = This packet is a source violated packet and it modified its forwarding algorithm to the CPU port. 0 = This packet is not a source violated packet.Bit [6]: Mirror. 1 = This is a mirrored packet. 0 = This is not a mirrored packet.Bit [5]: Span. 1 = This is a span packet. 0 = This is not a span packet.Bit [4]: Management. 1 = This is a management packet. 0 = This is not a management packet. Bit [3]: Ignore. Bit [2:0]: Source Port. 000_B = Port 0. 001_B = Port 1. 010_B = Port 2. 011_B = Port 3. 100_B = Port 4.101_B = Port 5.
Byte 3	Egress TAG[15:8].
Byte 4	Egress TAG[7:0].
Byte 5	Ignore.

3.2 MAC Clone and Port5 MII Connection

In ADM6996I/IX, there are three different configurations (MAC type MII mode, GPSI mode and RMII, **P5_BUSMD0**) for Port5 to connect the CPU's MII/GPSI or RMII interface.

Here we show a general router application of ADM6996I/IX, connected to the CPU with a single MII. In **Figure 6**, we can see either LAN to WAN or WAN to LAN, the packets will go through the same MII port. Because the CPU needs to send out the packets with the registered MAC ID to the WAN port, this MAC ID may also come in from the LAN ports. We know the switch learning scheme can't permit the packets with the same MAC ID input from different ports. In the ADM6996I/IX design, we use the MAC clone and VLAN group to solve this problem. From **Figure 9**, users can have more details for this implementation.

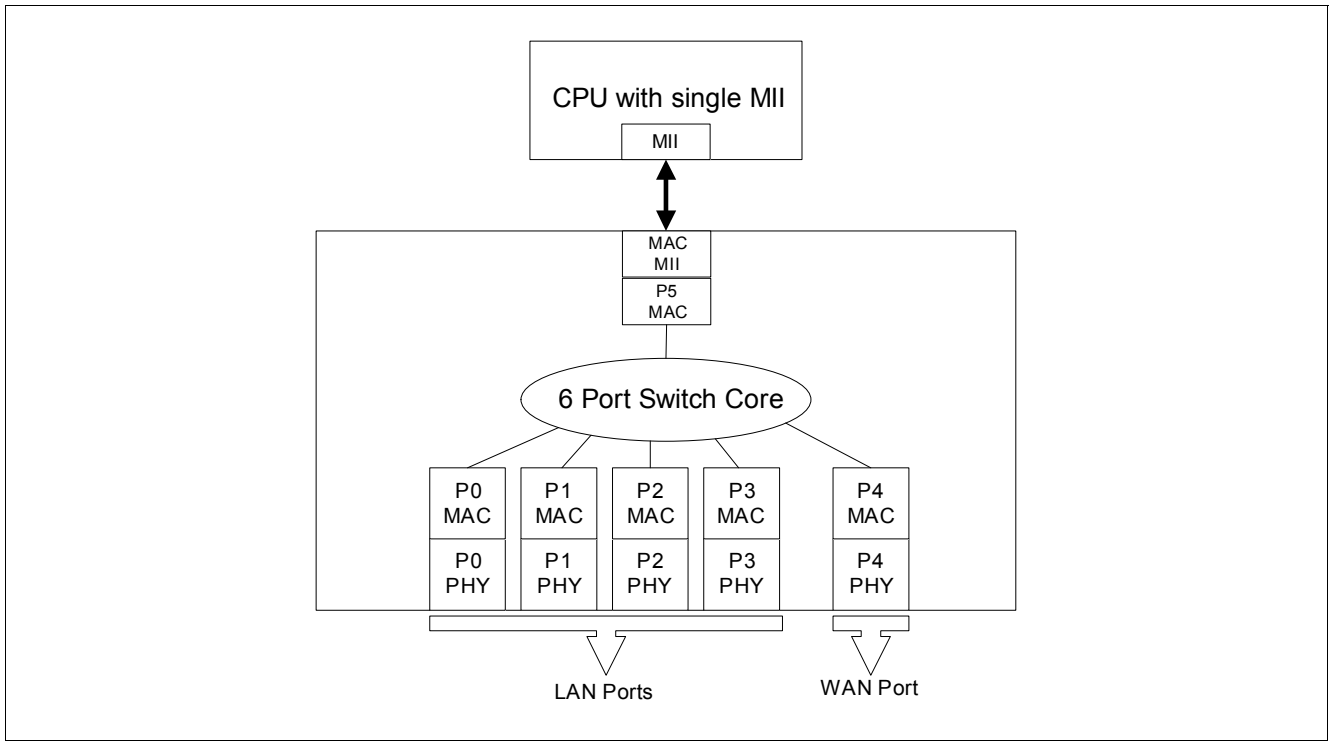

Figure 6 ADM6996I/IX to CPU with single MII Connection

Implementation of WAN/LAN applications on Samurai

ADM6996I/IX implements WAN/LAN application by ADM6996I/IX Special TAG functions.

Special Tag is inserted after the Ethernet SA field to allow the CPU to tell the switch how to handle the packets it sends or to know the source port when the CPU receives a packet.

Table 43 Special Tag

Pream-ble	DA	SA	Special TAG 0	Special TAG 1	Special TAG 2	Special TAG 3	Special TAG 4	Special TAG 5	VLAN Tag	SNAP	Type/ Length	Data	CRC
8B	6B	6B	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	4B	6B	2B		4B

Step 1: Set EEPROM 11_H[12]=1 to enable Special TAG Receive (CPU to ADM6996I/IX).

Step 2: Set EEPROM 11_H[11]=1 to enable Special TAG Transmit (ADM6996I/IX to CPU).

Set EEPROM 11_H[15:13] to assign CPU Port Number. Default CPU Port is "101 - Port5".

Set EEPROM $0B_H$[5] to set the option whether ADM6996I/IX CPU Port checks CRC for the packet with Special TAG Receive.

Set EEPROM 11_H[10] to set the option whether ADM6996I/IX adds Special TAG Transmit to Pause frame.

The configurations are as follows.

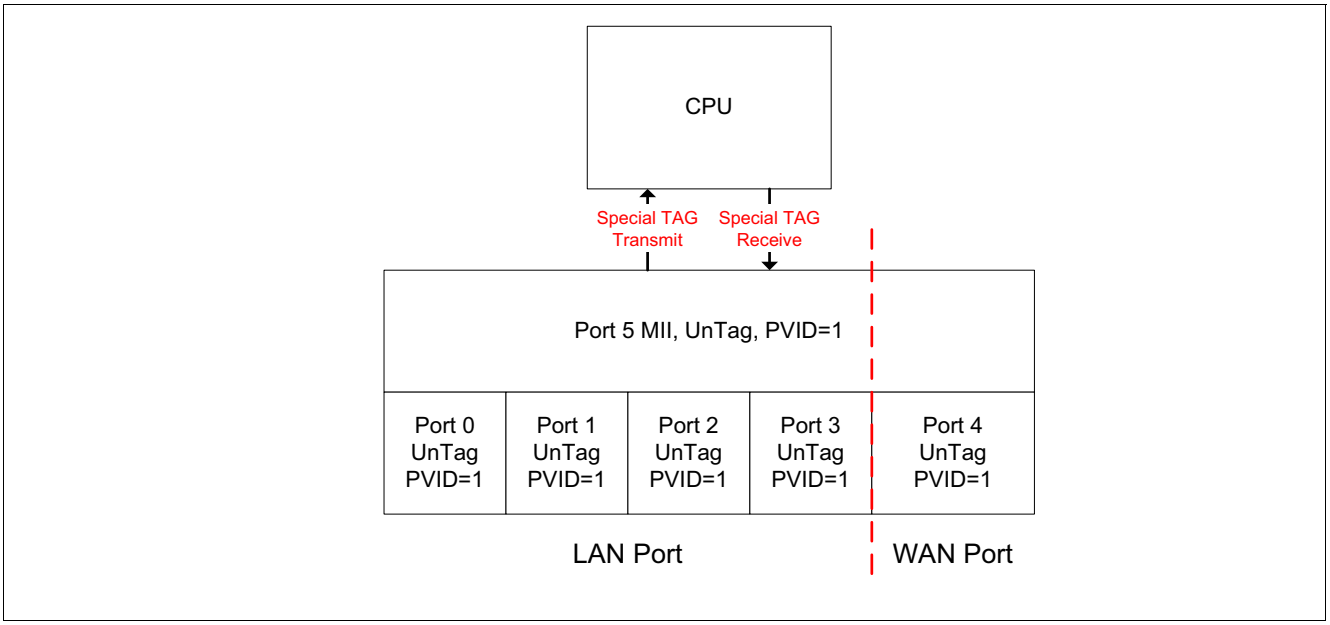

Figure 7 The configurations of the implementation by ADM6996I/IX Special TAG functions

- Step 1: Set ADM6996I/IX to port-based VLAN mode (default)
- Step 2: Set WAN/LAN group

Table 44 Set WAN/LAN Group

EEPROM	Received Port	Forwarding Group					
	Port-based Group	Port 0	Port 1	Port 2	Port 3	Port 4	Port 5
40_H	Port 0	✓	O	O	O		✓
42_H	Port 1	O	✓	O	O		✓
44_H	Port 2	O	O	✓	O		✓
46_H	Port 3	O	O	O	✓		✓
48_H	Port 4(WAN Port)					✓	✓
$4A_H$	Port 5(CPU Port)	✓	✓	✓	✓	✓	✓

Note: "✓" is necessary and "O" is optional to implement Port-based VLAN function of LAN group.

Port 0, Port 0/1/2/3/5, set REG 40_H to $002F_H$

Port 1, Port 0/1/2/3/5, set REG 42_H to $002F_H$

Port 2, Port 0/1/2/3/5, set REG 44_H to $002F_H$

Port 3, Port 0/1/2/3/5, set REG 46_H to $002F_H$

Port 4, Port 4/5, set REG 48_H to 0030_H

Port 5, Port 0/1/2/3/4/5, set REG $4A_H$ to $003F_H$

- Step 3: Set EEPROM 11_H[12:11]="11" to enable Special TAG Receive/Transmit Enable

Software Operation:

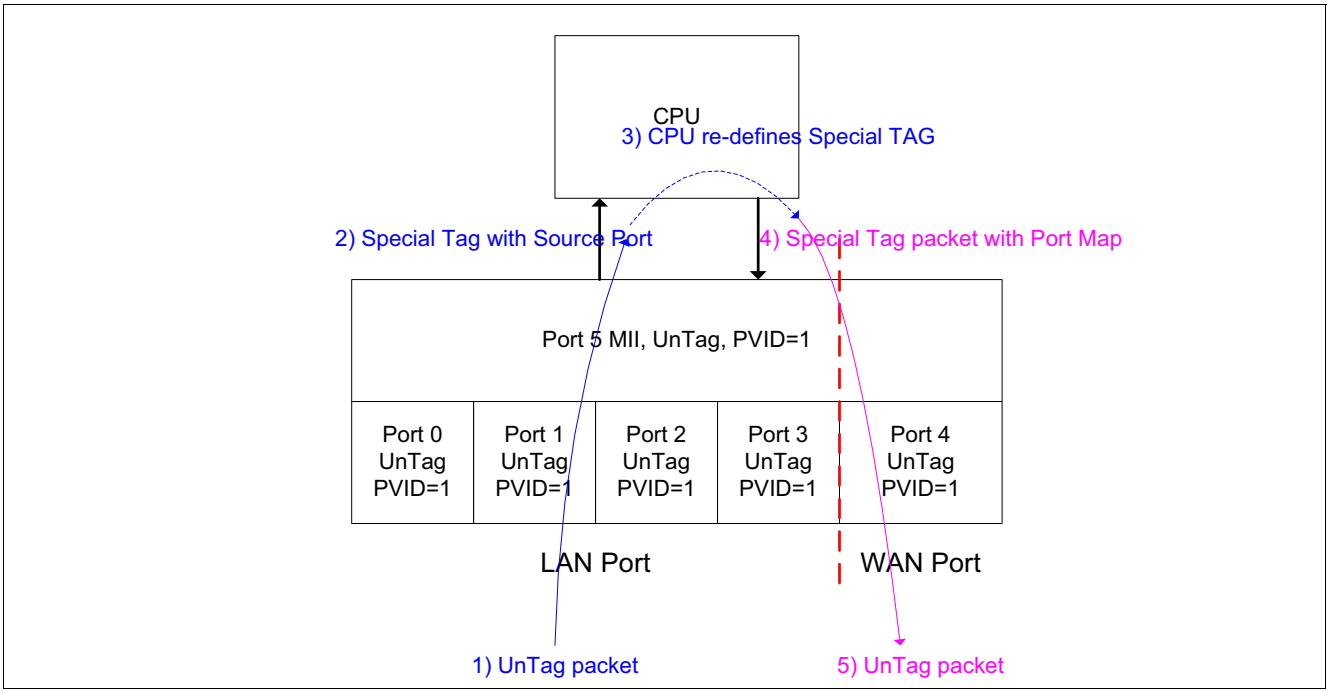

Figure 8 Software Operation

- Step 1:
  - If Untagged packet received from LAN Port forwards to CPU Port, ADM6996I/IX will insert Special TAG followed SA in the packets transmitted from the CPU port. ADM6996I/IX also allows users to choose what kinds of packets they don't want to insert this Special TAG in.

Table 45 Packets Identified by ADM6996I/IX

Packets Identified by ADM6996I/IX	Condition (EEPROM 0x11h[11] and 0x99h[8:0]	Result
BPDU/SLOW/ PAE/RESER_R0/ RESER_R1/ GXRP/ RESER_R2/ RESER_R3	Special TAG Transmit = 0_B. or {Special TAG Transmit, Insert Reserve} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert Reserve} = 11_B	Insert Special Tag on the CPU port.
ARP/RARP	Special TAG Transmit = 0_B. or {Special TAG Transmit, Insert ARP/RARP} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert ARP/RARP} = 11_B.	Insert Special Tag on the CPU port.
IGMP_IP/MLD_IP/ MLD_IPV6	Special TAG Transmit = 0_B. or {Special TAG Transmit, Insert Snoop} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert Snoop} = 11_B.	Insert Special Tag on the CPU port.
TYPE	Special TAG Transmit = 0_B. or {Special TAG Transmit, Insert Type} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert Type} = 11_B.	Insert Special Tag on the CPU port.

Table 45 Packets Identified by ADM6996I/IX

Packets Identified by ADM6996I/IX	Condition (EEPROM 0x11h[11] and 0x99h[8:0]	Result
PROTOCOL	Special TAG Transmit = 0_B. or {Special TAG Transmit, Insert Protocol} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert Protocol} = 11_B.	Insert Special Tag on the CPU port.
TCPUDP	Special TAG Transmit = 0_B. or {Special TAG Transmit, Insert TCP/UDP} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert TCP/UDP} = 11_B.	Insert Special Tag on the CPU port.
MAC_CTRL	Special TAG Transmit = 0_B. or {Special TAG Transmit, Insert MAC CTRL} = 10_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert MAC CTRL} = 11_B.	Insert Special Tag on the CPU port.
Others	Special TAG Transmit = 0_B. or {Special TAG Transmit, Insert Default, Source Violation} = 100_B.	Don't insert Special Tag on the CPU port.
	{Special TAG Transmit, Insert Default, Source Violation} = 110_B. or {Special TAG Transmit, Insert Default, Source Violation} = 101_B. {Special TAG Transmit, Insert Default, Source Violation} = 111_B.	Insert Special Tag

- Step 2: CPU must re-define the Special TAG for the Receive to determine the destination group.
- Step 3: If **MAC_CLONE** function is enabled, CPU must set **LRN** parameter to disable learning mechanism for specific packet.

Normally, the MAC mode MII should be connected to the PHY mode MII. But in some applications, we need to connect both MAC mode MII's to each other as shown. In **Figure 9**, due to most of the CPU's MII being in MAC mode, Port5 is MAC to MAC connection.

Through the hardware setting, it is easy to set ADM6996I/IX Port5 MII to operate in 100M Full duplex mode. As this mode (100M Full) is normally the operation mode to be with CPU, the interface connection is described in the following diagram.

(1) CKO25M is the 25M clock driven out by ADM6996I/IX to fit 100M MII operation. This clock output provides 8mA driving capability and it can be directly connected to TXCLK/RXCLK.

(2) Due to it's operation in Full duplex mode, COL is tied to GND.

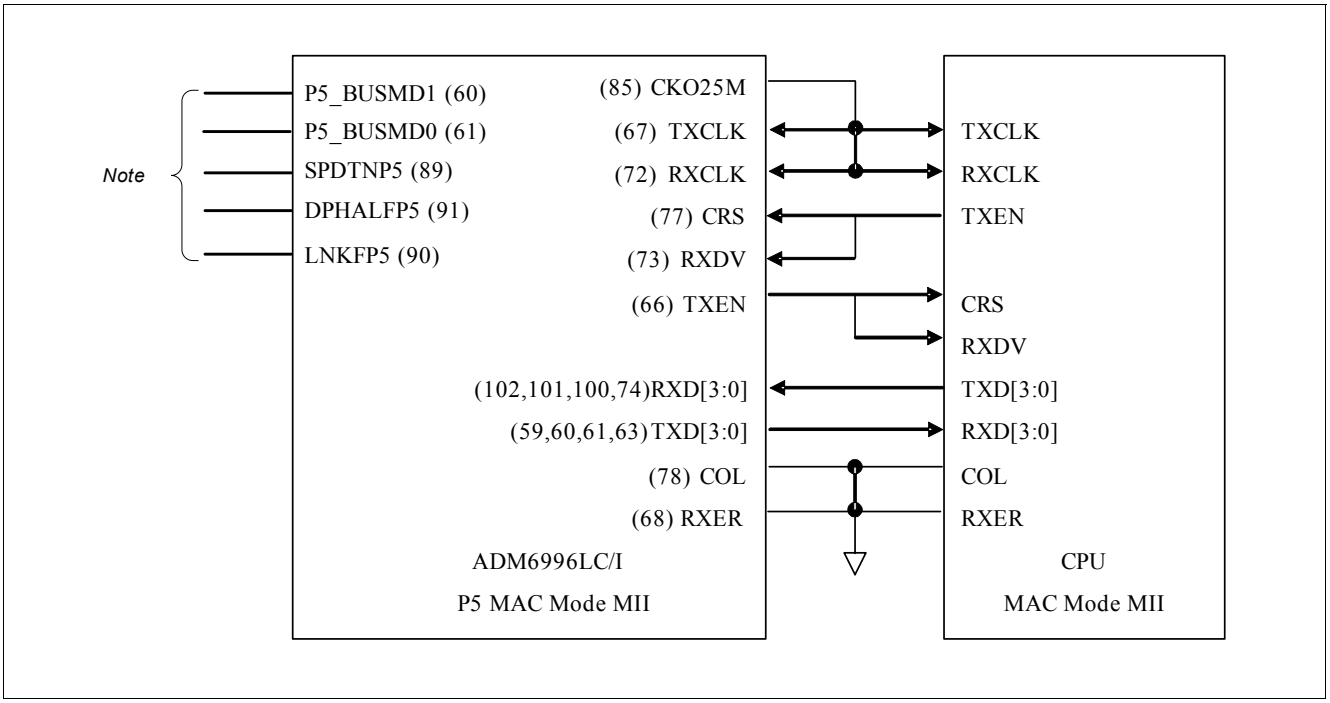

Figure 9 100M Full duplex MAC to MAC MII connection

Note:

1. *Pin 60 and pin 61 should be pull low to let P5_BUSMD be latched as "00" and forces Port5 to operate in MII mode (**P5_BUSMD0**).*
2. *Pin 89 (SPDTNP5) should be pull low or floating to set Port5 be operating in 100Mbit/s.*
3. *Pin 91 (DPHALFP5) should be pull low or floating to set Port5 be operating in full duplex mode.*
4. *Pin 90 (LNKFP5) should be pull low or floating to set Port5 Link up.*

3.3 10/100M PHY Block

The 100Base-X section of the device implements the following functional blocks:

100Base-X physical coding sub-layer (PCS)

100Base-X physical medium attachment (PMA)

100Base-X physical medium dependent (PMD)

The 10Base-T section of the device implements the following functional blocks:

10Base-T physical layer signaling (PLS)

10Base-T physical medium attachment (PMA)

The 100Base-X and 10Base-T sections share the following functional blocks:

Clock synthesizer module

MII Registers

IEEE 802.3u auto negotiation

The interfaces used for communication between PHY block and switch core is MII interface.

Auto MDIX function is supported. This function can be Enable/Disabled by the hardware pin.

Digital approach for the integrated PHY of Samurai-6I/6IX (ADM6996I/IX) has been adopted.

3.3.1 Auto Negotiation

The Auto Negotiation function provides a mechanism for exchanging configuration information between two ends of a link segment and automatically selecting the highest performance mode of operation supported by both devices. Fast Link Pulse (FLP) Bursts provide the signaling used to communicate auto negotiation abilities between two devices at each end of a link segment. For further detail regarding auto negotiation, refer to Clause 28 of the IEEE 802.3u specification. The Samurai-6I/6IX (ADM6996I/IX) supports four different Ethernet protocols, so the inclusion of auto negotiation ensures that the highest performance protocol will be selected based on the ability of the link partner.

The auto negotiation function within the Samurai-6I/6IX (ADM6996I/IX) can be controlled either by internal register access or by the use of configuration pins are sampled. If disabled, auto negotiation will not occur until software enables bit 12 in MII register 0. If auto negotiation is enabled, the negotiation process will commence immediately.

When auto negotiation is enabled, the Samurai-6I/6IX (ADM6996I/IX) transmits the abilities programmed into the auto negotiation advertisement register at address 04h via FLP bursts. Any combination of 10 Mbit/s, 100 Mbit/s, half duplex, and full duplex modes may be selected. Auto negotiation controls the exchange of configuration information. Upon successfully auto negotiation, the abilities reported by the link partner are stored in the auto negotiation link partner ability register at address 05_H.

The contents of the “auto negotiation link partner ability register” are used to automatically configure to the highest performance protocol between the local and far-end nodes. Software can determine which mode has been configured by auto negotiation by comparing the contents of register 04_H and 05_H and then selecting the technology whose bit is set in both registers of highest priority relative to the following list.

100Base-TX full duplex (highest priority)

100Base-TX half duplex

10Base-T full duplex

10Base-T half duplex (lowest priority)

The basic mode control register at address 0_H provides control of enabling, disabling, and restarting of the auto negotiation function. When auto negotiation is disabled, the speed selection bit (bit 13) controls switching between 10 Mbit/s or 100 Mbit/s operation, while the duplex mode bit (bit 8) controls switching between full duplex operation and half duplex operation. The speed selection and duplex mode bits have no effect on the mode of operation when the auto negotiation enable bit (bit 12) is set.

The basic mode status register at address 1_H indicates the set of available abilities for technology types (bit 15 to bit 11), auto negotiation ability (bit 3), and extended register capability (bit 0). These bits are hardwired to indicate the full functionality of the Samurai-6I/6IX (ADM6996I/IX). The BMSR also provides status on:

Whether auto negotiation is complete (bit 5)

Whether the Link Partner is advertising that a remote fault has occurred (bit 4)

Whether a valid link has been established (bit 2)

The auto negotiation advertisement register at address 4_H indicates the auto negotiation abilities to be advertised by the Samurai-6I/6IX (ADM6996I/IX). All available abilities are transmitted by default, but writing to this register or configuring external pins can suppress any ability.

The auto negotiation link partner ability register at address 05_H indicates the abilities of the Link Partner as indicated by auto negotiation communication. The contents of this register are considered valid when the auto negotiation complete bit (bit 5, register address 1_H) is set.

3.3.2 Speed/Duplex Configuration

The twelve sets of four pins listed in **Table 46** configure the speed/duplex capability of each channel of Samurai-6I/6IX (ADM6996I/IX). The logic states of these pins are latched into the advertisement register (register address 4_H) for auto negotiation purpose. These pins are also used for evaluating the default value in the base mode control register (register 0_H) according to **Table 46**.

In order to make these pins have the same Read/Write priority as software, they should be programmed to 11111111_B in case user likes to update the advertisement register through software.

Table 46 Speed/Duplex Configuration

Auto Negotiation (Pin & EEPROM)	Speed (Pin & EEPROM)	Duplex (Pin & EEPROM)	Auto Negotiation	Advertise Capability				Parallel Detect Capability			
				100F	100H	10F	10H	100F	100H	10F	10H
1	1	1	1	1	1	1	1	0	1	0	1
1	1	0	1	0	1	0	1	0	1	0	1
1	0	1	1	0	0	1	1	0	0	0	1
1	0	0	1	0	0	0	1	0	0	0	1
0	1	1	0	1	—	—	—	—	—	—	—
0	1	0	0	—	1	—	—	—	—	—	—
0	0	1	0	—	—	1	—	—	—	—	—
0	0	0	0	—	—	—	1	—	—	—	—

3.4 Hardware, EEPROM and SMI Interfacefor Configuration

Three ways are supported to configure the setting in the Samurai-6I/6IX (ADM6996I/IX):

- Hardware Setting
- EEPROM Interface
- SMI Interface

Users could use EEPROM and SMI interfaces combined with the CPU port to provide proprietary functions. Four pins are needed when using these two interfaces. See **Figure 10** as a description.

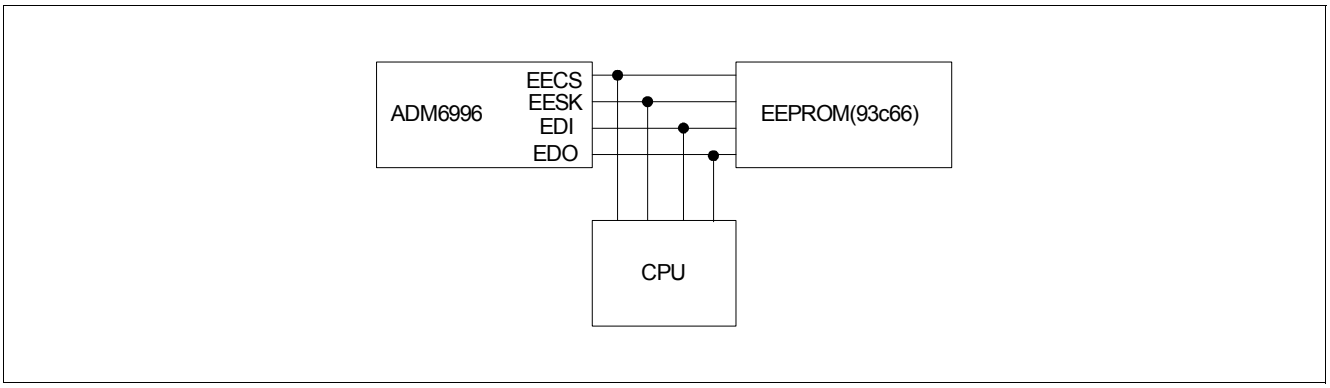

Figure 10 Interconnection between Samurai-6I/6IX (ADM6996I/IX), EEPROM and CPU

3.4.1 Hardware Setting

The Samurai-6I/6IX (ADM6996I/IX) provides some hardware pins where values reside during power on or reset,when they are strapped for the default setting.

Table 47 Hardware Setting

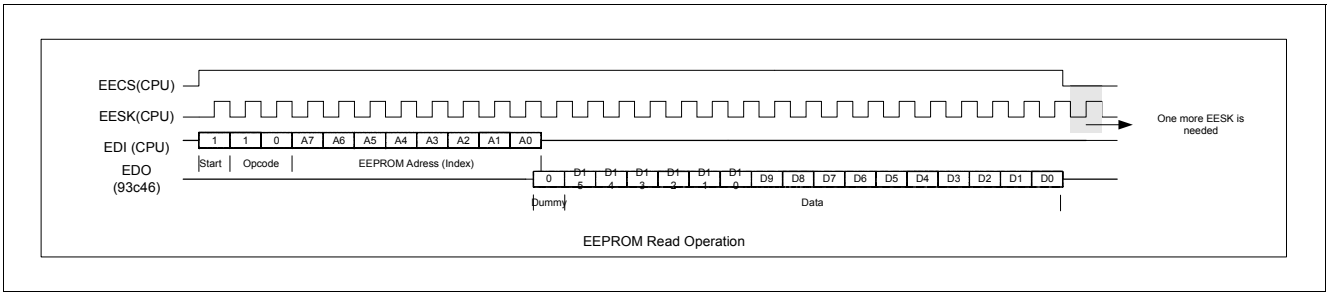
Setting Name	Description
GFCEN	Global Flow Control Enable. 0_B Flow Control Capability is depended upon the register setting in corresponding EEPROM register 1_B All ports flow control capability is enabled.
SDIO_MD	SDC/SDIO mode selection. 0_B 16 bits mode 1_B 32 bits mode
P5_BUSMD[1:0]	Port 5 bus mode selection bit 0. P5_BUSMD[1:0] Interface 00_B MII01 01_B GPSI 10_B RMII 11_B Reserved and Not Allowed.
BPEN	Recommend Back-Pressure in half-duplex. 0_B Disable Back-Pressure. 1_B Enable Back-Pressure
RECANEN	Recommend Auto Negotiation Enable. Only valid for Twisted pair interface. Programmed this bit to 1 has no effect to Fiber port. 0_B Disable all TP port auto negotiation capability 1_B Enable all TP port auto negotiation capability
XOVEN	Cross Over Enable. Only available in TP interface. 0_B Disable 1_B Enable
LED_MODE	Enable Mac to choose LED Display Mode. 0_B Single color LED 1_B Dual color LED

3.4.2 EEPROM Interface

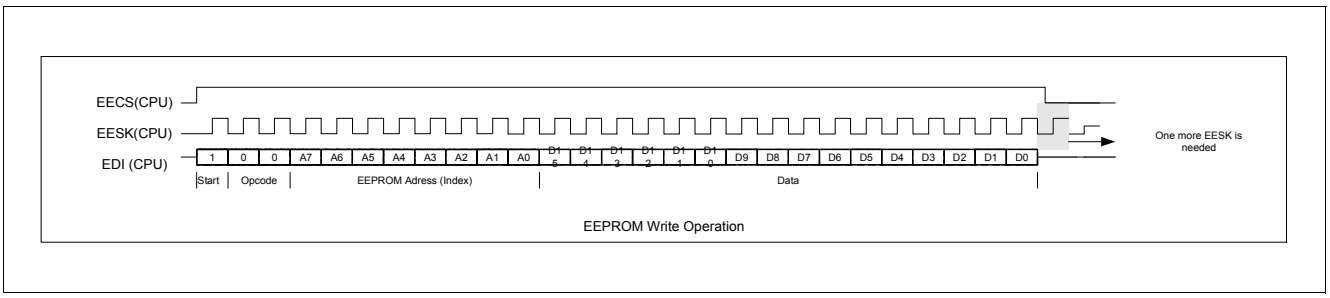
The EEPROM Interface is provided so users can easily configure the settings without the CPU's help. Because the EEPROM Interface is the same as the 93c66, it also allows the CPU to write the EEPROM register and renew the 93c66 at the same time. After power up or reset (default value from the hardware pins fetched in this stage), the Samurai-6I/6IX (ADM6996I/IX) will automatically detect the presence of the EEPROM by reading the address 0 in the 96c66. If the value = 4154_H, it will read all the data in the 93c66. If not, the Samurai-6I/6IX (ADM6996I/IX) will stop loading the 93c66. The user also can pull down the **EDO** to force the Samurai-6I/6IX (ADM6996I/IX) not to load the 93c66. The 93c66 loading time is around 500ms. Then CPU should give the high-z value in the **EECS**, **EESK** and **EDI** pins in this period if we really want to use the CPU to read or write the registers in the Samurai-6I/6IX (ADM6996I/IX).

The EEPROM Interface needs only one Write command to complete a writing operation. If updating the 93c66 at the same time is necessary, three commands Write Enable, Write, and Write Disable are needed to complete this job (See 93c66 Spec. for a reference). Users should note that the EERPOM interface only allows the CPU to write the EEPROM register in the Samurai-6I/6IX (ADM6996I/IX) and doesn't support the READ command. If the CPU gives the Read Command, Samurai-6I/6IX (ADM6996I/IX) will not respond and 93c66 will respond with the value. Users should also note that one additional EESK cycle is needed between any continuous commands (Read or Write).

(1) Read 93c66 via the EEPROM Interface (Index = 2, Data = 1111_H).



(2) Write EEPROM registers in the Samurai-6I/6IX (ADM6996I/IX) (Index = 2, Data =2222_H).



Power-On-Sequence of Samurai

The following diagram shows the power-on-sequence of Samurai.

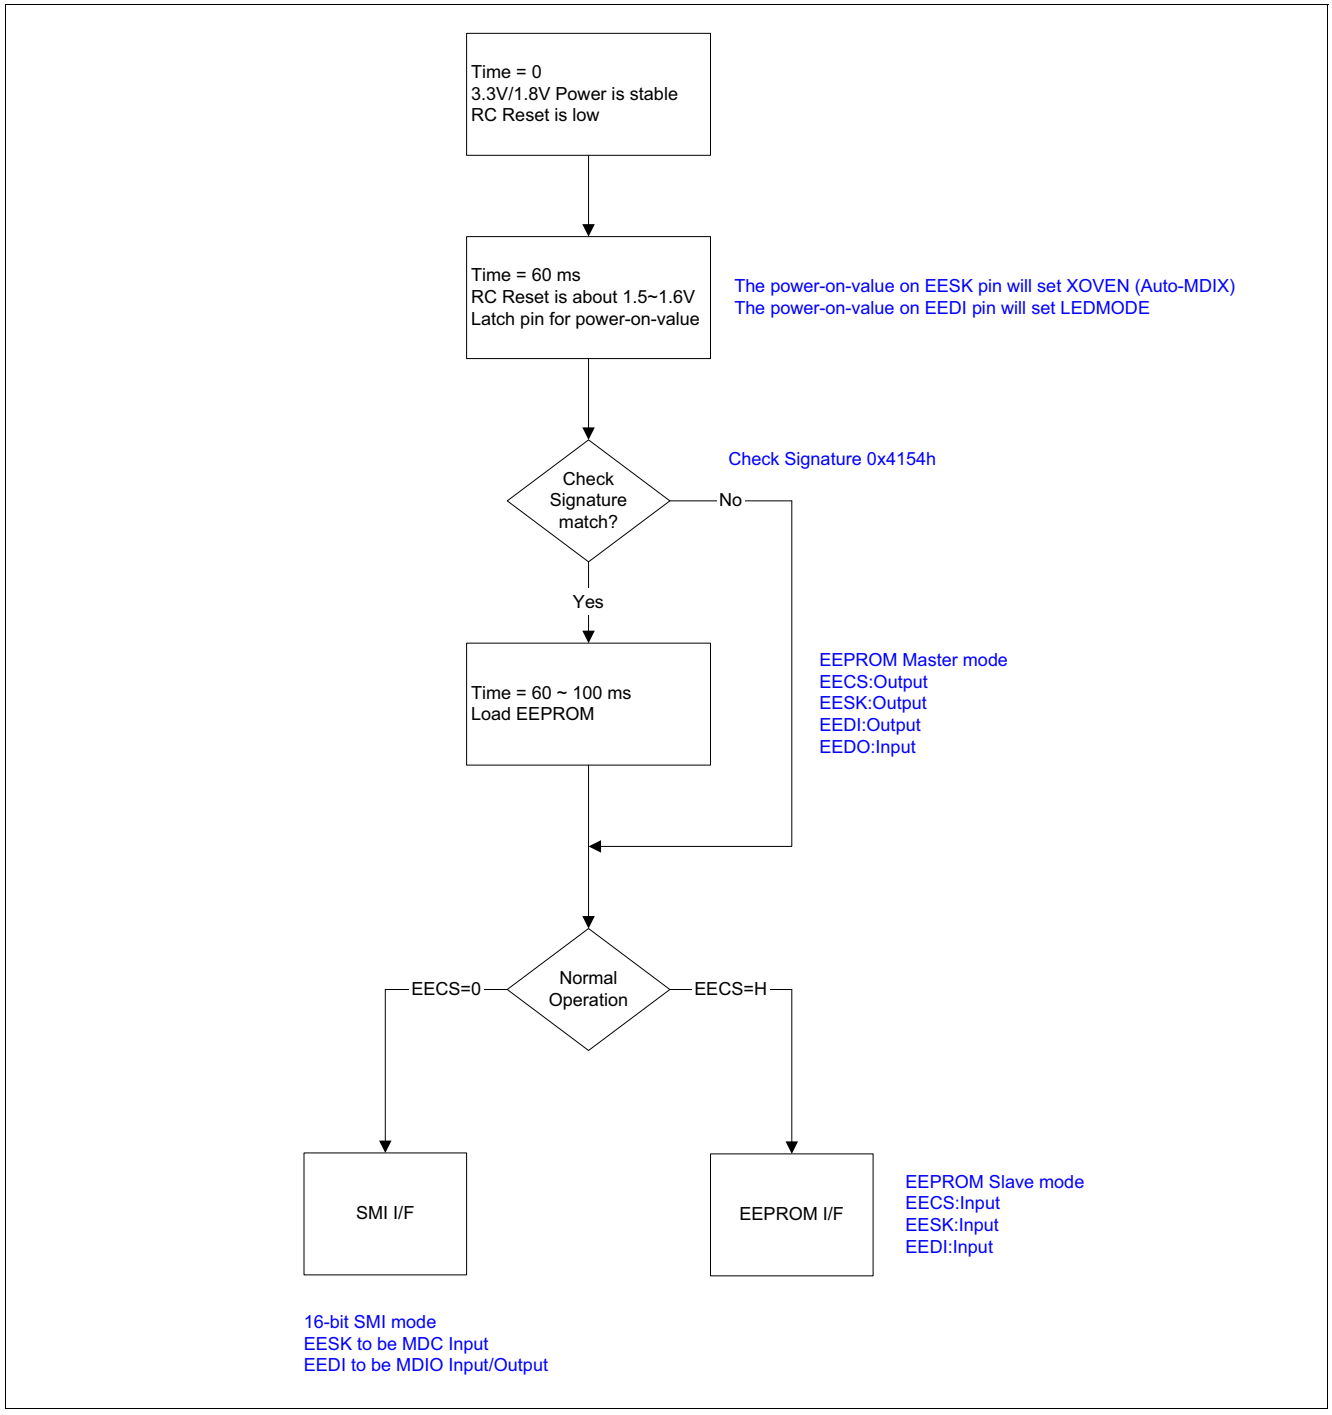


Figure 11 The Power-On-Sequence of Samurai

Set ADM6996LC/FC Pin59 SDIO_MD=1 to 16-bit SMI mode.

Set ADM6996I/IX/M Pin59 SDIO_MD=0(default) to 16-bit SMI mode.

Waveform 1: RC Reset

Waveform 2: EECS

Waveform 4: EESK

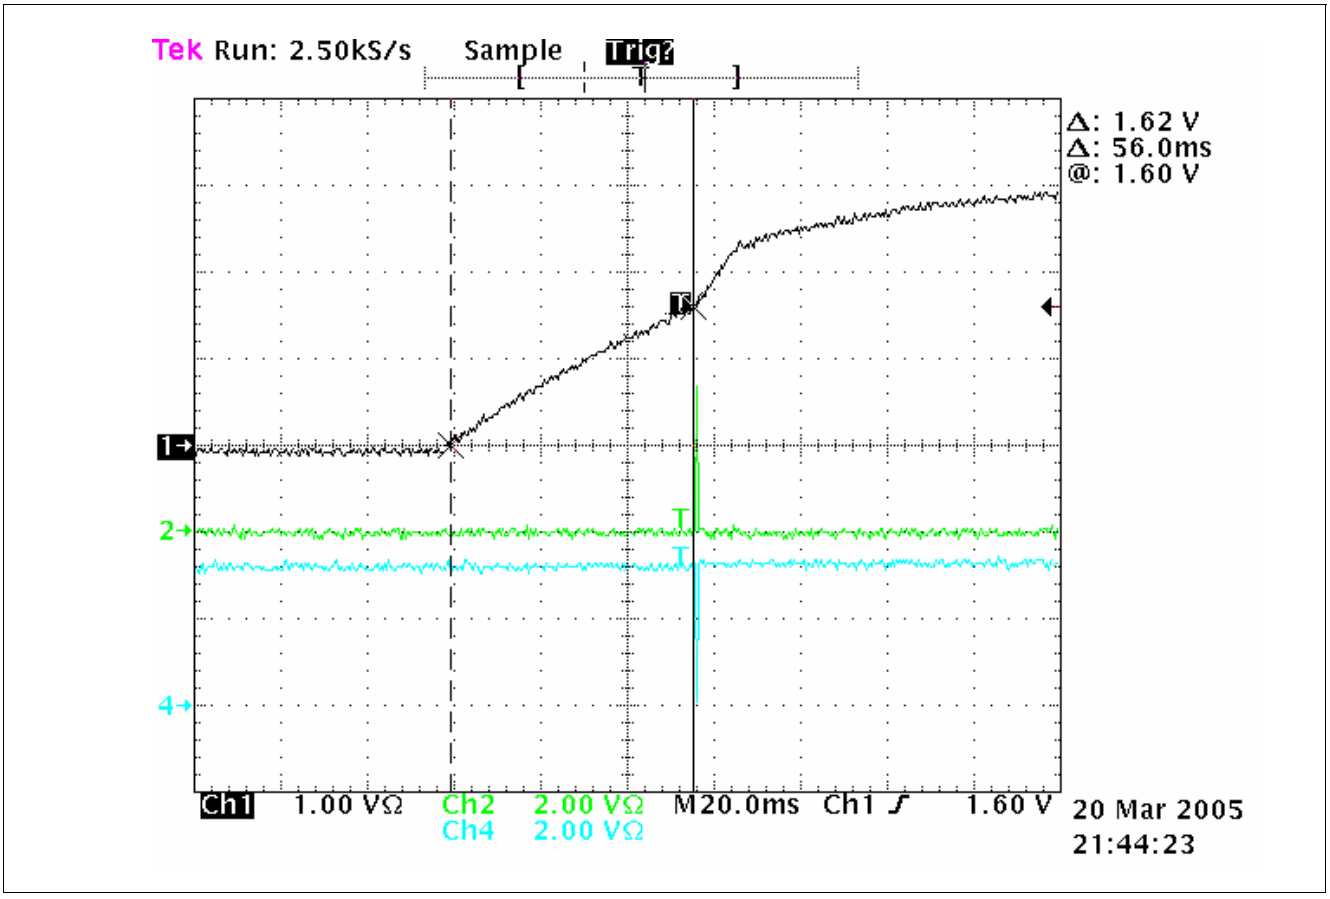

Figure 13 Timing Diagram of RC, EECS and EESK (without EEPROM)

3.4.3 SMI Interface

The SMI consists of two pins, management data clock (**EESK**) and management data input/output (**EDI**). The Samurai-6I/6IX (ADM6996I/IX) is designed to support an EESK frequency up to 25 MHz. The EDI pin is bi-directional and may be shared with other devices. EECS pin may be needed (pulled to low) if the EEPROM interface is also used.

The EDI pin requires a 1.5 KΩ pull-up which, during idle and turnaround periods, will pull EDI to a logic one state. Samurai-6I/6IX (ADM6996I/IX) requires a single initialization sequence of 32 bits of preamble following power-up/hardware reset. The first 32 bits are preamble consisting of 32 contiguous logic one bits on EDI and 32 corresponding cycles on EESK. Following preamble is the start-of-frame field indicated by a $<01_B>$ pattern. The next field signals the operation code (OP): $<10_B>$ indicates read from management register operation, and $<01_B>$ indicates write to management register operation. The next field is management register address. It is 10 bits wide and the most significant bit is transferred first.

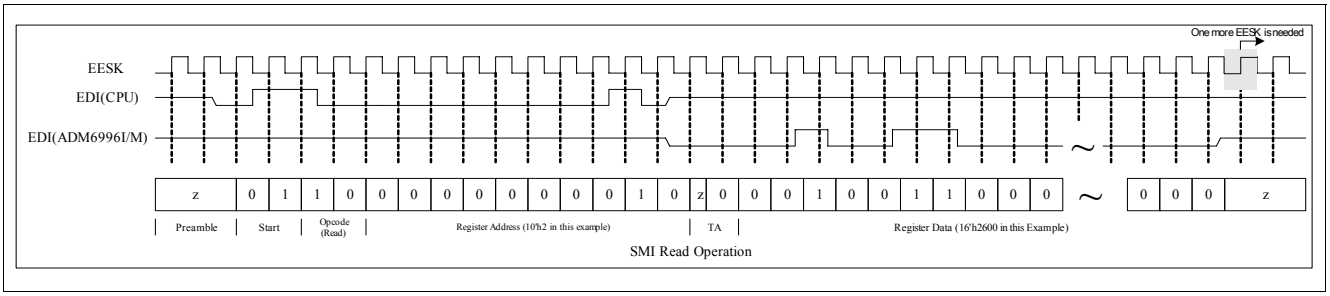
During Read operation, a 2-bit turn around (TA) time spacing between the register address field and data field is provided for the EDI to avoid contention. Following the turnaround time, a 16-bit data stream is read from or written into the management registers of the Samurai-6I/6IX (ADM6996I/IX).

(A) Preamble Suppression

The SMI of Samurai-6I/6IX (ADM6996I/IX) supports a preamble suppression mode. The Samurai-6I/6IX (ADM6996I/IX) requires a single initialization sequence of 32 bits of preamble following power-up/hardware reset. This requirement is generally met by pulling-up the resistor of EDI While the Samurai-6I/6IX (ADM6996I/IX) will respond to management accesses without preamble, a minimum of one idle bit between management transactions is required.

When Samurai-6I/6IX (ADM6996I/IX) detects that there is address match, then it will enable Read/Write capability for external access. When address is mismatched, then Samurai-6I/6IX (ADM6996I/IX) will tri-state the EDI pin.

(B) Read Switch Register via SMI Interface (Offset Hex = 10'h2, Data = 16'h2600)



(C) Write Switch Register via SMI Interface (Offset Hex = 10'h180, Data = 16'h1300)

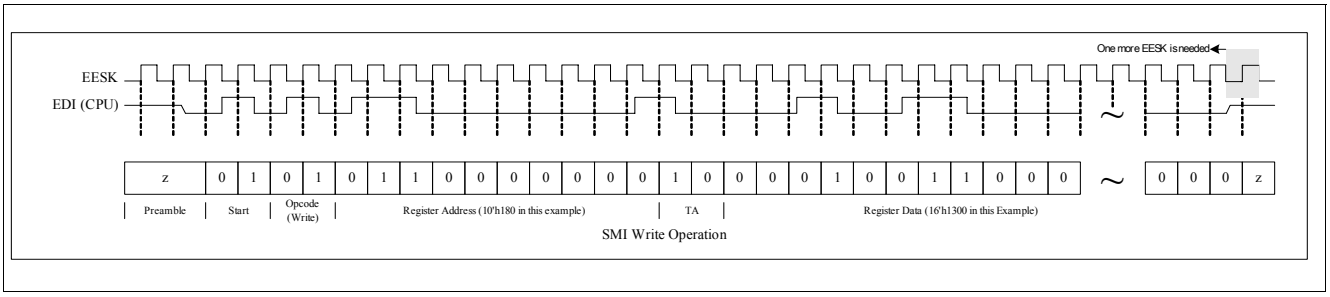


Table 48 (D) The Pin Type of EECS, EESK, EDI and EDO during the Operation

Pin Name	Reset Operation	Load EEPROM	Write Operation	Read Operation
EECS	Input	Output	Input	Input
EESK	Input	Output	Input	Input
EDI	Input	Output	Input	Input/Output
EDO	Input	Input	Input	Input

How to Use Samurai 16-bit Mode SMI to Access EEPROM/Counter/PHY Register by CPU MDC/MDIO Interface

Samurai supports a 16-bit mode SMI interface to access EEPROM/Counter/PHY Register by CPU MDC/MDIO interface. The SMI interface consists of two pins, management data clock (EESK) and management data input/output (EEDI).

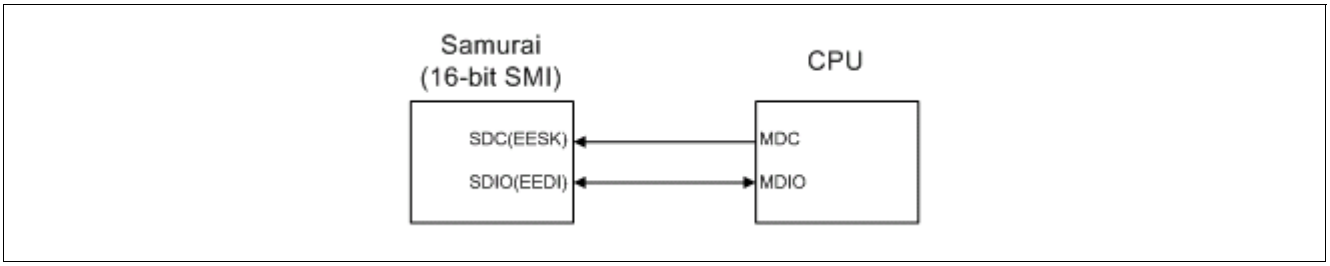

Figure 14 SMI Interface

- The difference between SMI Command and MDC/MDIO Command
  - Samurai SMI Command uses 10-bit register address to access allocate EEPROM/Counter/PHY Register.

Memory Map

Table 49 Memory Map

Register	Definition
0000_H ~ $003F_H$	EEPROM BAISC Register Map
0040_H ~ $009B_H$	EEPROM Extended Register Map
$00A0_H$ ~ 0143_H	Counter and Switch Status Map
0200_H ~ $02FF_H$	PHY Register Map

So you need to divide 10-bit register address to 5-bit PHY address and 5-bit REG address of MDC/MDIO command to access EEPROM/Counter Register Map. For Samurai PHY Register Map, you can set the 5-bit PHY address = '10000' and use the standard REG address to access P0~P4 PHY MII Register.

3.5 The Hardware Difference between ADM6996I/IX and ADM6996L

ADM6996LC is power-down version to replace ADM6996L and ADM6996I/IX is advanced function version to new application.

4 Registers Description

The EEPROM provides Samurai-6I/6IX (ADM6996I/IX) with many option settings

Main Settings

- Port Configuration: Speed, Duplex, Flow Control Capability and Tag/ Untag.
- VLAN & TOS Priority Mapping
- Broadcast Storming rate and Trunk.
- Fiber Select, Auto MDIX select
- VLAN Mapping
- Per Port Buffer number

The register is addressed wordwise.

Table 53 Register Access Types

Mode	Symbol	Description HW	Description SW
read/write	rw	Register is used as input for the HW	Register is read and writable by SW
read	r	Register is written by HW (register between input and output -> one cycle delay)	Value written by software is ignored by hardware; that is, software may write any value to this field without affecting hardware behavior (= Target for development.)
Read only	ro	Register is set by HW (register between input and output -> one cycle delay)	SW can only read this register
Read virtual	rv	Physically, there is no new register, the input of the signal is connected directly to the address multiplexer.	SW can only read this register
Latch high, self clearing	lhsc	Latch high signal at high level, clear on read	SW can read the register
Latch low, self clearing	llsc	Latch high signal at low-level, clear on read	SW can read the register
Latch high, mask clearing	lhmk	Latch high signal at high level, register cleared with written mask	SW can read the register, with write mask the register can be cleared (1 clears)
Latch low, mask clearing	llmk	Latch high signal at low-level, register cleared on read	SW can read the register, with write mask the register can be cleared (1 clears)
Interrupt high, self clearing	ihsc	Differentiate the input signal (low->high) register cleared on read	SW can read the register
Interrupt low, self clearing	ilsc	Differentiate the input signal (high->low) register cleared on read	SW can read the register
Interrupt high, mask clearing	ihmk	Differentiate the input signal (high->low) register cleared with written mask	SW can read the register, with write mask the register can be cleared
Interrupt low, mask clearing	ilmk	Differentiate the input signal (low->high) register cleared with written mask	SW can read the register, with write mask the register can be cleared
Interrupt enable register	ien	Enables the interrupt source for interrupt generation	SW can read and write this register
latch_on_reset	lor	rw register, value is latched after first clock cycle after reset	Register is read and writable by SW
Read/write self clearing	rwsc	Register is used as input for the hw, the register will be cleared due to a HW mechanism.	Writing to the register generates a strobe signal for the HW (1 pdi clock cycle) Register is read and writable by SW.

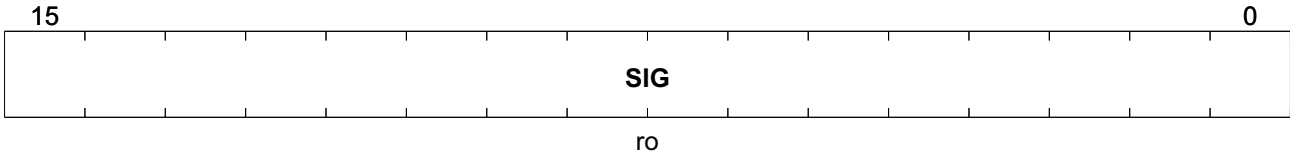
Table 54 Registers Clock Domains

Clock Short Name	Description
–	–

4.1 EEPROM Basic Registers

Signature Register

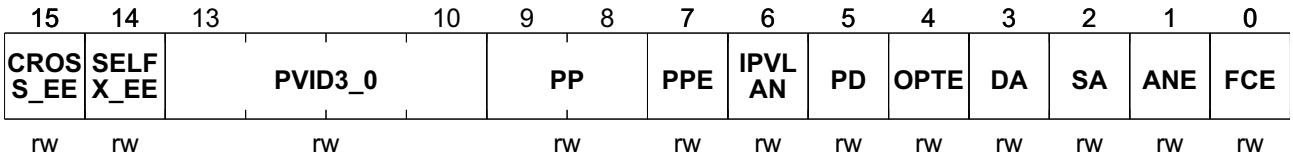
SIG	Offset	Reset Value
Signature Register	00_H	4154_H



Field	Bits	Type	Description
SIG	15:0	ro	**Signature** The value must be 4154_H . Samurai-6I/6IX (ADM6996I/IX) uses this value to check if the EEPROM is attached. If the value in the EEPROM does not equal to 4154_H , Samurai-6I/6IX (ADM6996I/IX) will stop loading the EEPROM even if the EEPROM is attached. Samurai-6I/6IX (ADM6996I/IX) will use the default value to initialize.

P0 Basic Control Register

P0BC	Offset	Reset Value
P0 Basic Control Register	01_H	$040F_H$



Field	Bits	Type	Description
CROSS_EE	15	rw	**Crossover Auto Detect Enable** This bit is used together with the value (cross_hw) on the pin **EESK/SDC** during the power on reset and the value (wait_init) on the pin **WAIT_INIT** during the normal mode to decide if PHY enables this function. This bit is useless in Port 5. Combine with wait_initand cross_hw, the crossover auto detect capability is summarized as below : {wait_init, cross_hw, cross_ee} Description $1x1_B$ This port will enable Crossover Auto Detect Enable function $1x0_B$ This port will disable Crossover Auto Detect Enable function $01x_B$ This port will enable Crossover Auto Detect Enable function 000_B This port will disable Crossover Auto Detect Enable function 001_B This port will enable Crossover Auto Detect Enable function
SELFX_EE	14	rw	**Select FX** This bit is used together with the value (p4fx_hw) on the pin **P4FX** during the power on reset to decide if the PHY operates on the fiber mode. This bit is useless in Port 5. SELFX_EE can set Port 0, 1, 2, 3 to FX or TX . Port 4 mode is decisded by : {p4fx_hw, selfx_ee} Description $1x_B$ Port 4: Port 4 will operate in the fiber mode 00_B Port 4: Port 4 will operate in the twisted mode 01_B Port 4: Port 4 will operate in the fiber mode
PVID3_0	13:10	rw	**Private VID** See 0028_H ~ $002C_H$ to find the other PVID [11:4]
PP	9:8	rw	**Port Priority** 00_B Assign packets to Queue 0 01_B Assign packets to Queue 1 10_B Assign packets to Queue 2 11_B Assign packets to Queue 3
PPE	7	rw	**Port Priority Enable** 0_B The port priority is disabled 1_B The port priority is enabled
IPVLAN	6	rw	**IP over VLAN PRI** This bit gives Switch instruction to check IP or VLAN priority when both priorities happened on coming packet. 0_B Use the priority bits in the tag header to assign the priority queue 1_B Use the IP PRI to assign the priority queue
PD	5	rw	**Port Disable** 0_B Port 0, 1, 2, 3, 4: PHY work s normally. Port 5: Port 5 works normally 1_B Port 0, 1, 2, 3, 4. PHY is disabled. Port 5: Port 5 is forced to link down
OPTE	4	rw	**Output Packet Tagging Enable** 0_B Untagged packets are transmitted 1_B Tagged packets are transmitted

Field	Bits	Type	Description
DA	3	rw	**Duplex Ability** It is useless in Port 5. 0_B Recommend PHY to work in the half duplex mode 1_B Recommend PHY to work in the full duplex mode
SA	2	rw	**Speed Ability** 0_B Recommend PHY to work in the 10M mode 1_B Recommend PHY to work in the 100M mode
ANE	1	rw	**Auto Negotiation Enable** 0_B Recommend PHY to work without Auto Negotiation 1_B Recommend PHY to work with Auto Negotiation, when the value on the pin DUPCOL0 during the power on reset is 1
FCE	0	rw	**Flow Control Enable** 0_B Recommend MAC to work without Pause or Back Pressure 1_B In full duplex, recommend MAC to work with Pause when the value on the TXD0 during the power on reset is 1. In half duplex, recommend MAC to work with Back Pressure when the value on the DUPCOL2 during the power on reset is 1

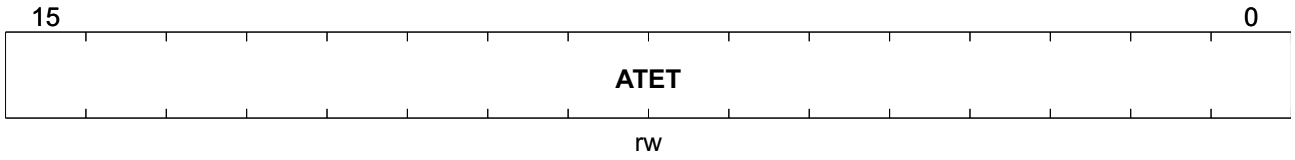
Res	14:0	rw	**Reserved**

ADM TAG Ether Type

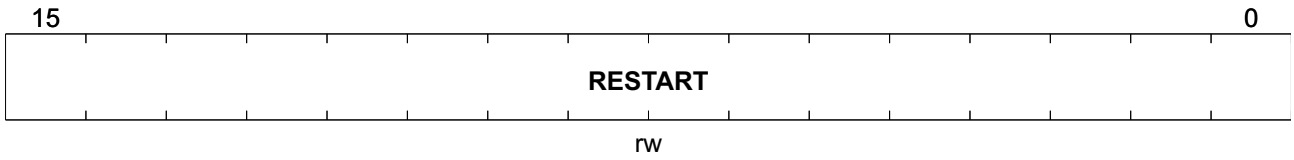
ATET	Offset	Reset Value
ADM TAG Ether Type	**$2E_H$**	**0000_H**



Field	Bits	Type	Description
ATET	15:0	rw	**ADM TAG Ether Type** This value is used by the user to define their Ether-Type. When Special Tag Receive is enabled, Samurai-6I/6IX (ADM6996I/IX) checks the packets on the CPU port to see if the two bytes following the SA are the same as ADM TAG Ether Type . If they are different, Samurai-6I/6IX (ADM6996I/IX) bypasses the Special Tag. If the same, Samurai-6I/6IX (ADM6996I/IX) will use the value in the Special Tag to do switching decisions .

PHY Restart Register

PR	Offset	Reset Value
PHY Restart Register	$2F_H$	0000_H



Field	Bits	Type	Description
RESTART	15:0	rw	**Restart** Samurai-6I/6IX (ADM6996I/IX) writes this register to restart all the PHYs in the switch. The value written is not important.

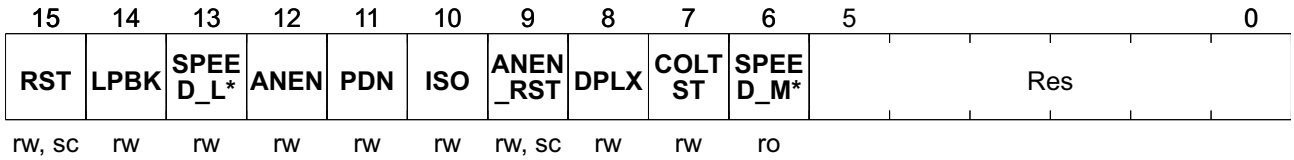
4.4 PHY Registers

PHY Control Register of Port 0

PHY_C0	Offset	Reset Value
PHY Control Register of Port 0	**200_H**	**3100_H**



Field	Bits	Type	Description
RST	15	rw, sc	**RESET** Setting this bit initiates the software reset function that resets the selected port, except for the phase-locked loop circuit. It will re-latch in all hardware configuration pin values The software reset process takes 25 ≤γs to complete. This bit, which is self-clearing, returns a value of 1 until the reset process is complete. 0_B Normal operation 1_B PHY Reset
LPBK	14	rw	**Loop Back Enable** This bit controls the PHY loopback operation that isolates the network transmitter outputs (TXP and TXN) and routes the MII transmit data to the MII receive data path. This function should only be used when auto negotiation is disabled (bit 12 = 0). The specific PHY (10Base-T or 100Base-X) used for this operation is determined by bits 12 and 13 of this register 0_B Disable Loopback mode 1_B Enable loopback mode
SPEED_LSB	13	rw	**Speed Selection LSB, 0.6, 0.13** Link speed is selected by this bit or by auto negotiation if bit 12 of this register is set (in which case, the value of this bit is ignored).If it is fiber mode, 0.13 is always 1. Any write to this bit will have no effect. 00_B 10 Mbit/s 01_B 100 Mbit/s 10_B 1000 Mbit/s 11_B Reserved

Field	Bits	Type	Description
ANEN	12	rw	**Auto Negotiation Enable** This bit determines whether the link speed should set up by the auto negotiation process or not. It is set at power up or reset if the RECANEN pin detects a logic 1 input level in Twisted-Pair Mode.If it is set when fiber mode is configured, any write to this bit will be ignored . 0_B Disable Auto negotiation process 1_B Enable auto negotiation process
PDN	11	rw	**Power Down Enable** Ored result with PI_PWRDN pin. Setting this bit high or asserting the PI_PWRDN puts the PHY into power down mode. During the power down mode, TXP/TXN and all LED outputs are tristated and the MII interfaces are isolated. 0_B Normal Operation 1_B Power Down
ISO	10	rw	**Isolate PHY from Network** Setting this control bit isolates the part from the MII, with the exception of the serial management interface. When this bit is asserted, the PHY does not respond to TXD, TXEN and TXER inputs, and it presents a high impedence on its TXC, RXC, CRSDV, RXER, RXD , COL and CRS outputs. 0_B Normal Operation 1_B Isolate PHY from MII
ANEN_RST	9	rw, sc	**Restart Auto Negotiation** Setting this bit while auto negotiation is enabled forces a new auto negotiation process to start. This bit is self-clearing and returns to 0 after the auto negotiation process has commenced. 0_B Normal Operation 1_B Restart Auto Negotiation Process
DPLX	8	rw	**Duplex Mode** If auto negotiation is disabled, this bit determines the duplex mode for the link. 0_B Half Duplex mode 1_B Full Duplex mode
COLTST	7	rw	**Collision Test** When set, this bit will cause the COL signal of MII interface to be asserted in response to the assertion of TXEN. 0_B Disable COL signal test 1_B Enable COL signal test
SPEED_MSB	6	ro	**Speed Selection MSB** Set to 0 all the time indicate that the PHY does not support 1000 Mbit/s function.

Similar Registers

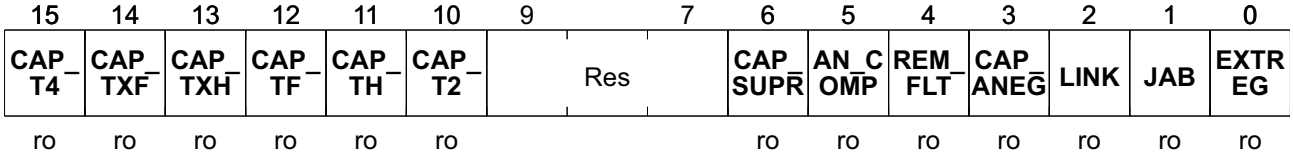
All PHY_Cx registers have the same structure and characteristics, see **PHY_C0**.
The offset addresses of the other PHY_Cx registers are listed in **Table 66**.

Table 66 PHY_Cx Registers

Register Short Name	Register Long Name	Offset Address	Page Number
PHY_C1	PHY Control Register of Port 1	220_H	
PHY_C2	PHY Control Register of Port 2	240_H	
PHY_C3	PHY Control Register of Port 3	260_H	
PHY_C4	PHY Control Register of Port 4	280_H	

PHY Status Register of Port 0

PHY_S0	Offset	Reset Value
PHY Status Register of Port 0	201_H	7849_H



Field	Bits	Type	Description
CAP_T4	15	ro	**100Base-T4 Capable** Set to 0 all the time to indicate that the PHY does not support 100Base-T4
CAP_TXF	14	ro	**100Base-X Full Duplex Capable** Set to 1 all the time to indicate that the PHY does support Full Duplex mode
CAP_TXH	13	ro	**100Base-X Half Duplex Capable** Set to 1 all the time to indicate that the PHY does support Half Duplex mode
CAP_TF	12	ro	**10M Full Duplex Capable** TP : Set to 1 all the time to indicate that the PHY does support 10M Full Duplex mode FX : Set to 0 all the time to indicate that the PHY does not support 10M Full Duplex mode
CAP_TH	11	ro	**10M Half Duplex Capable** TP : Set to 1 all the time to indicate that the PHY does support 10M Half Duplex mode FX : Set to 0 all the time to indicate that the PHY does not support 10M Half Duplex mode
CAP_T2	10	ro	**100Base-T2 Capable** Set to 0 all the time to indicate that the PHY does not support 100Base-T2
CAP_SUPR	6	ro	**MF Preamble Suppression Capable** This bit is hardwired to 1 indicating that the PHY accepts management frame without preamble. Minimum 32 preamble bits are required following power-on or hardware reset. One idle bit is required between any two management transactions as per IEEE 802.3u specification.

Field	Bits	Type	Description
AN_COMP	5	ro	**Auto Negotiation Complete** If auto negotiation is enabled, this bit indicates whether the auto negotiation process has been completed or not. Set to 0 all the time when Fiber Mode is selected. 0_B Auto Negotiation process not completed 1_B Auto Negotiation process completed
REM_FLT	4	ro	**Remote Fault Detect** This bit is latched to 1 if the RF bit in the auto negotiation link partner ability register (bit 13, register address 05_H) is set or the receive channel meets the far end fault indication function criteria. It is unlatched when this register is read. 0_B Remote Fault not detected 1_B Remote Fault detected
CAP_ANEG	3	ro	**Auto Negotiation Ability** TP : This bit is set to 1 all the time, indicating that PHY is capable of auto negotiation. FX : This bit is set to 0 all the time, indicating that PHY is not capable of auto negotiation in Fiber Mode. 0_B Not capable of auto negotiation 1_B Capable of auto negotiation
LINK	2	ro	**Link Status** This bit reflects the current state of the link – test-fail state machine. Loss of a valid link causes a 0 latched into this bit. It remains 0 until this register is read by the serial management interface. Whenever Linkup, this bit should be read twice to get link up status 0_B Link is down 1_B Link is up
JAB	1	ro	**Jabber Detect** 0_B Jabber condition not detected 1_B Jabber condition detected
EXTREG	0	ro	**Extended Capability** This bit defaults to 1, indicating that the PHY implements extended registers. 0_B No extended register set 1_B Extended register set

5 Electrical Specification

5.1 TX/FX Interface

5.1.1 TP Interface

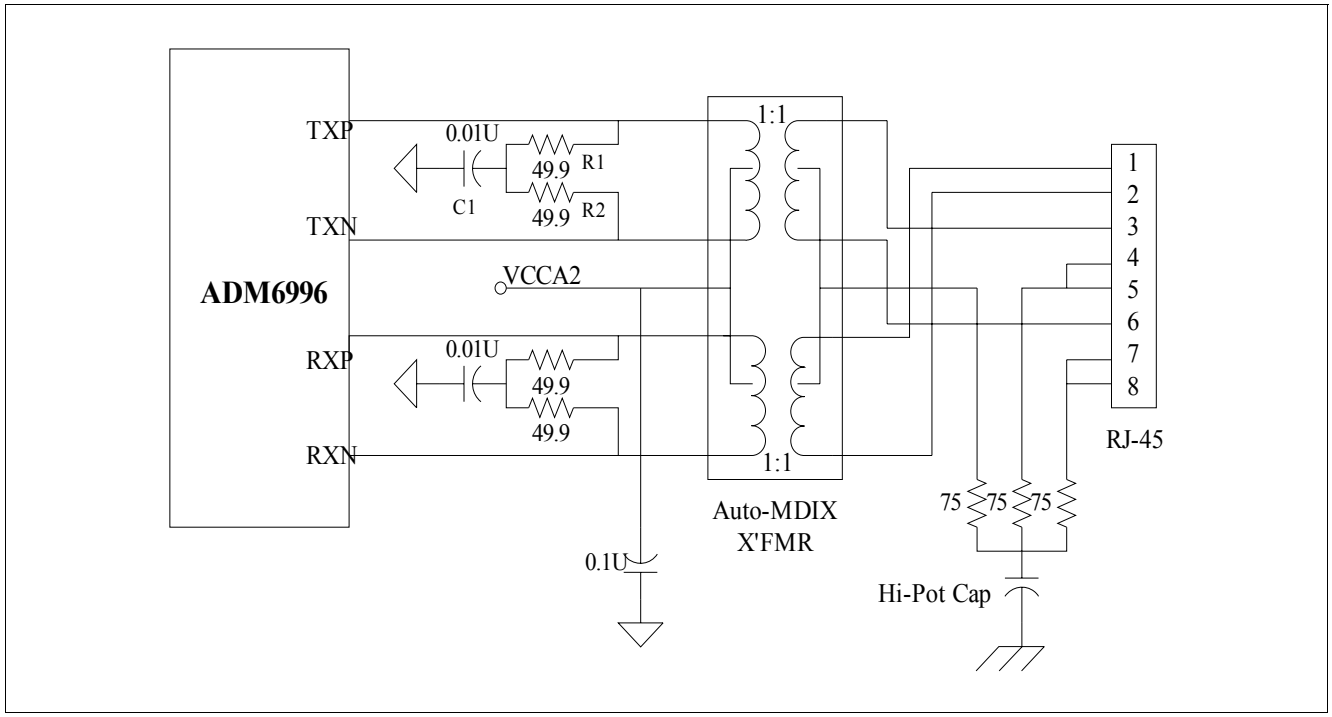

Figure 15 TP Interface

Transformer requirements:

- TX/RX rate 1:1
- TX/RX central tap connect together to VCCA2

Users can change the TX/RX pin for easy layout but do not change the polarity. Samurai-6I/6IX (ADM6996I/IX) supports auto polarity on the receiving side.

5.1.2 FX Interface

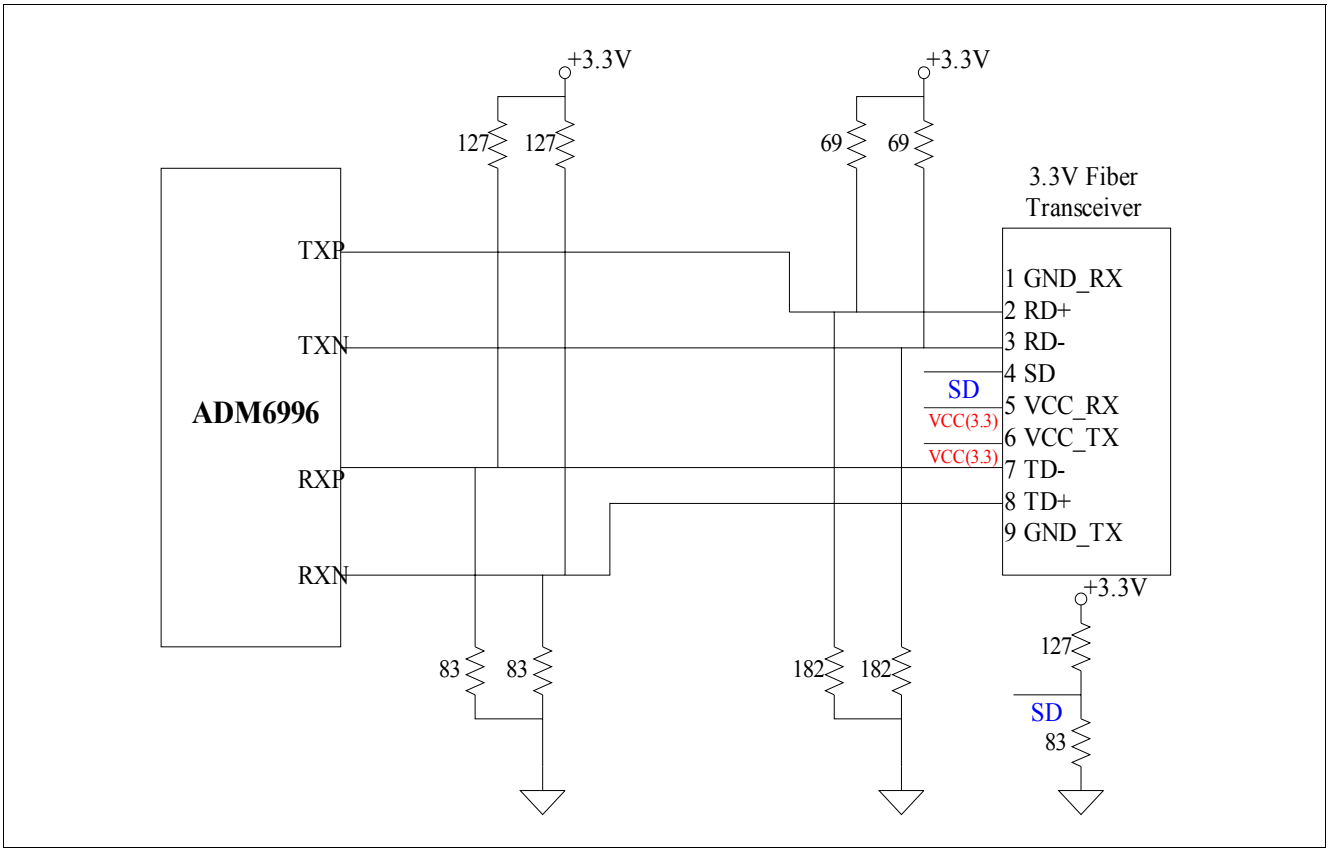

Figure 16 FX Interface

5.2 DC Characterization

Table 75 Power Consumption

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Power consumption when all twisted pair ports are linked at 100 Mbit/s.	P_{100M_5TP}	–	980	–	mW	Under EEPROM Register 29_H = $C000_H$, and 30_H = 985_H
Power consumption when all twisted pair ports are linked at 10 Mbit/s (include transformer).	P_{10M_5TP}	–	1450	–	mW	Under EEPROM Register 29_H = $C000_H$, and 30_H = 985_H
Power consumption when all twisted pair ports are disconnected.	P_{DIS_5TP}	–	500	–	mW	Under EEPROM Register 29_H = $C000_H$, and 30_H = 985_H

Table 76 Absolute Maximum Ratings

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
3.3 V Power Supply for I/O pad	V_{CC3O}	2.97	3.3	3.63	V	–
3.3 V Power Supply for bias circuit	V_{CCBS}	2.97	3.3	3.63	V	–
3.3 V Power Supply for A/D converter	V_{CCAD}	2.97	3.3	3.63	V	–
1.8 V Power Supply for line driver	V_{CCA2}	1.62	1.8	1.98	V	–
1.8 V Power Supply for PLL	V_{CCPLL}	1.62	1.8	1.98	V	–
1.8 V Power Supply for Digital core	V_{CCIK}	1.62	1.8	1.98	V	–
Input Voltage	V_{IN}	-0.3	–	V_{CC3O} + 0.3	V	–
Output Voltage	V_{out}	-0.3	–	V_{CC3O} + 0.3	V	–
Maximum current for 3.3 V power supply	$I_{3.3VMAX}$	–	–	100	mA	–
Maximum current for 1.8 V power supply (include transformer)	$I_{1.8VMAX}$	–	–	800	mA	–
Storage Temperature	T_{STG}	-55	–	155	°C	–
Thermal Resistance	$Theta_{JA}$		33.0		°C/W	
	$Theta_{JC}$		14.9		°C/W	
ESD Rating	ESD	1.0	–	–	kV	–

Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

Table 77 Recommended Operating Conditions

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
3.3 V Power Supply for I/O pad	V_{CC3O}	3.135	3.3	3.465	V	–
3.3 V Power Supply for bias circuit	V_{CCBS}	3.135	3.3	3.465	V	–
3.3 V Power Supply for A/D converter	V_{CCAD}	3.135	3.3	3.465	V	–
1.8 V Power Supply for line driver	V_{CCA2}	1.71	1.8	1.89	V	–
1.8 V Power Supply for PLL	V_{CCPLL}	1.71	1.8	1.89	V	–
1.8 V Power Supply for Digital core	V_{CCIK}	1.71	1.8	1.89	V	–

Table 77 Recommended Operating Conditions (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input Voltage	V_{in}	0	–	V_{CC}	V	–
Junction Operating Temperature	T_j	0	25	115	°C	–

Table 78 DC Electrical Characteristics for 3.3 V Operation[1)]

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input Low Voltage	V_{IL}	–	–	0.8	V	TTL
Input High Voltage	V_{IH}	2.0	–	–	V	TTL
Output Low Voltage	V_{OL}	–	–	0.4	V	TTL
Output High Voltage	V_{OH}	2.4	–	–	V	TTL
Input Pull-up/down Resistance	R_I	–	50	–	kΩ	V_{IL} = 0 V or V_{IH} = V_{cc3o}

1) Under V_{CC3O} = 2.97V ~ 3.63 V, T_j = 0 °C ~ 115 °C

5.3 AC Characterization

5.3.1 XTAL/OSC Timing

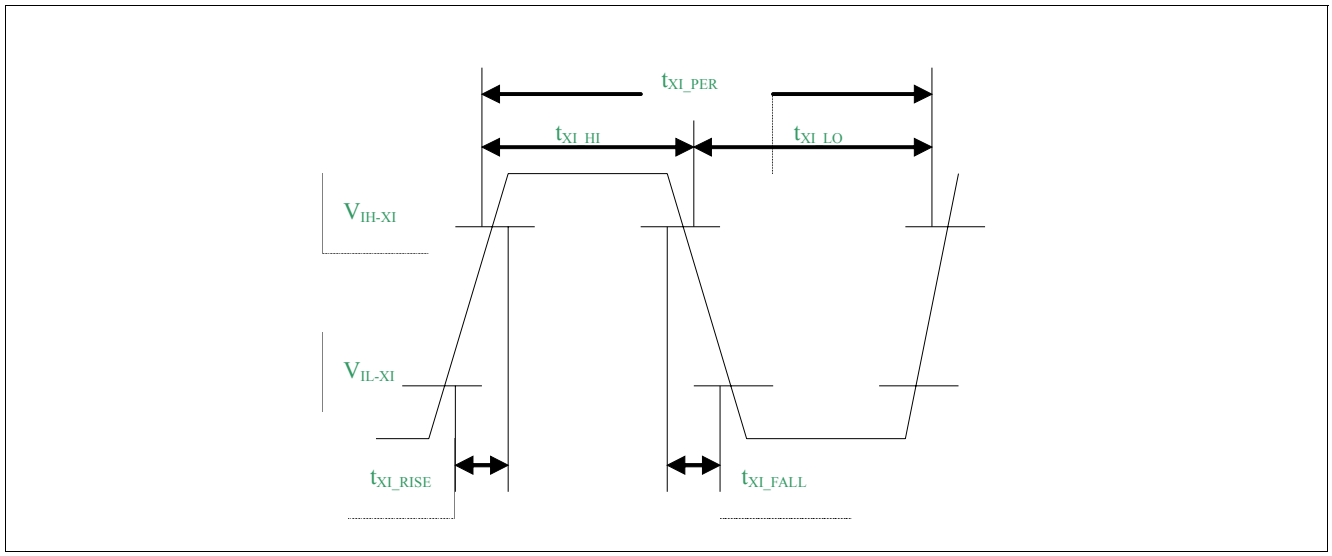

Figure 17 XTAL/OSC Timing

Table 79 XTAL/OSC Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
XI/OSCI Clock Period	$t_{\_XI\_PER}$	40.0 - 50ppm	40.0	40.0 + 50ppm	ns	–
XI/OSCI Clock High	$t_{\_XI\_HI}$	14	20.0	–	ns	–
XI/OSCI Clock Low	$t_{\_XI\_LO}$	14	20.0	–	ns	–
XI/OSCI Clock Rise Time, V_{IL} (max) to V_{IH} (min.)	$t_{\_XI\_RISE}$	–	–	4	ns	–
XI/OSCI Clock Fall Time, V_{IH} (min.) to V_{IL} (max)	$t_{\_XI\_FALL}$	–	–	4	ns	–

5.3.2 Power On Reset

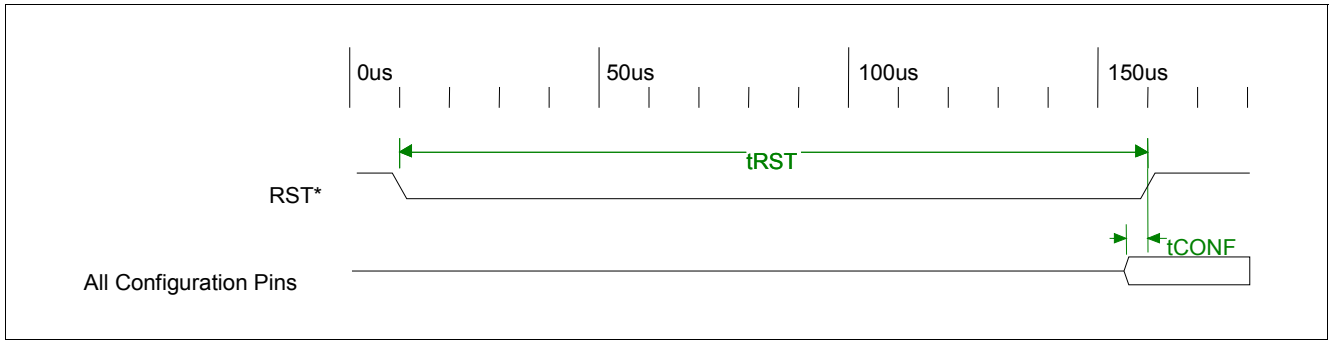

Figure 18 Power On Reset Timing

Table 80 Power On Reset Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
RST Low Period	t_{RST}	100	–	–	ms	–
Start of Idle Pulse Width	t_{CONF}	100	–	–	ns	–

5.3.3 EEPROM Interface Timing

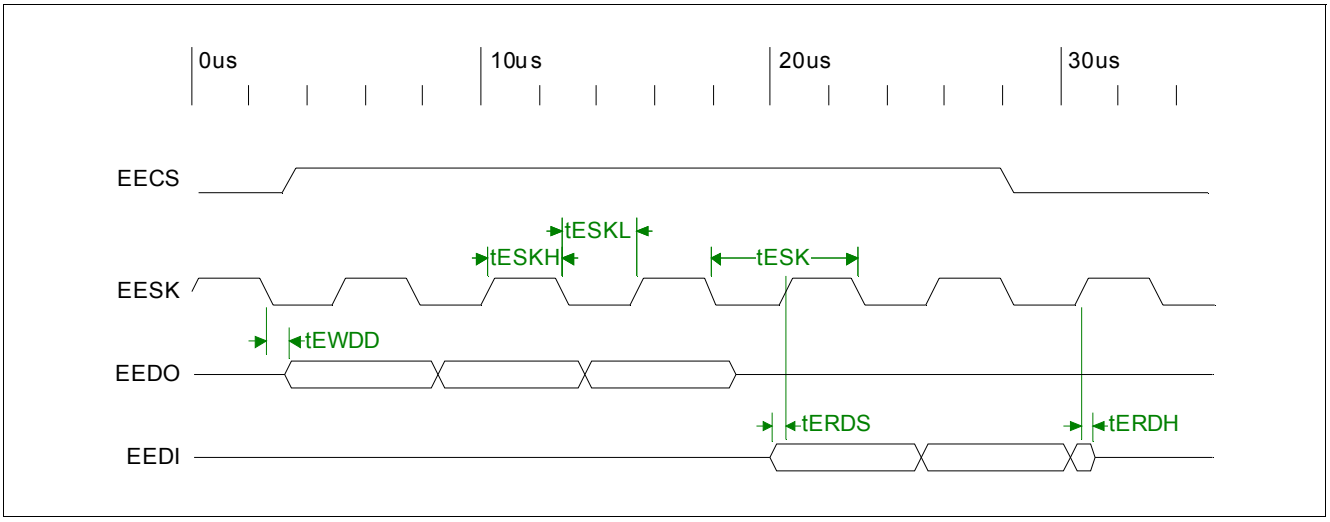

Figure 19 EEPROM Interface Timing

Table 81 EEPROM Interface Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
EESK Period	t_{ESK}	–	5120	–	ns	–
EESK Low Period	t_{ESKL}	2550	–	2570	ns	–
EESK High Period	t_{ESKH}	2550	–	2570	ns	–
EEDI to EESK Rising Setup Time	t_{ERDS}	10	–	–	ns	–
EEDI to EESK Rising Hold Time	t_{ERDH}	10	–	–	ns	–
EESK Falling to EDO Output Delay Time	t_{EWDD}	–	–	20	ns	–

5.3.4 10Base-TX MII Input Timing

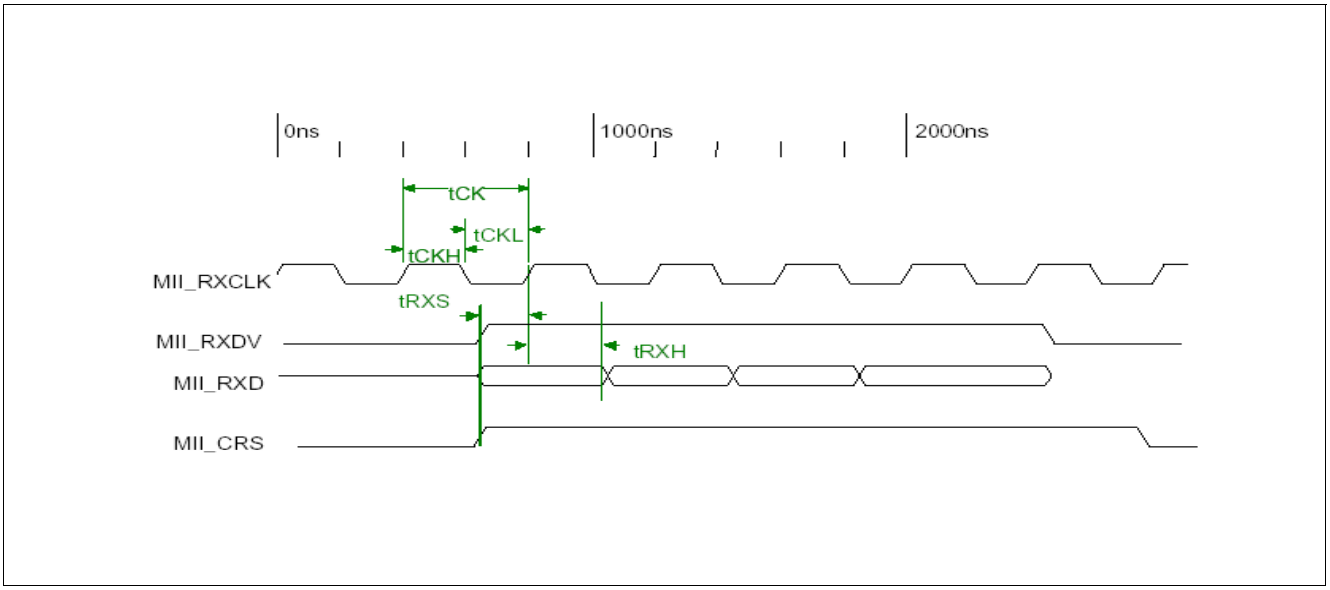

Figure 20 10Base-TX MII Input Timing

Table 82 10Base-TX MII Input Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MII_RXCLK Period	t_{CK}	–	400	–	ns	–
MII_RXCLK Low Period	t_{CKL}	180	–	220	ns	–
MII_RXCLK High Period	t_{CKH}	180	–	220	ns	–
MII_CRS, MII_RXDV and MII_RXD to MII_RXCLK rising setup	t_{RXS}	10	–	–	ns	–
MII_CRS, MII_RXDV and MII_RXD to MII_RXCLK rising hold	t_{RXH}	10	–	–	ns	–

5.3.5 10Base-TX MII Output Timing

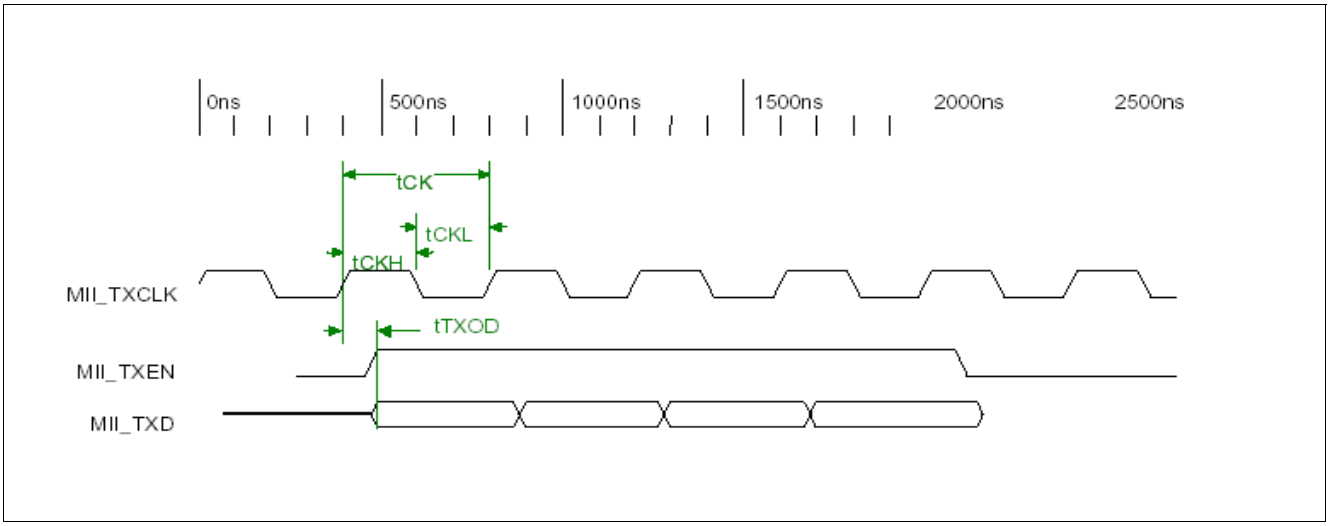

Figure 21 10Base-TX MII Output Timing

Table 83 10-Base-TX MII Output Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MII_TXCLK Period	t_{CK}	–	400	–	ns	–
MII_TXCLK Low Period	t_{CKL}	180	–	220	ns	–
MII_TXCLK High Period	t_{CKH}	180	–	220	ns	–
MII_TXD, MII_TXEN to MII_TXCLK Rising Output Delay	t_{TXOD}	0	–	25	ns	–

5.3.6 100Base-TX MII Input Timing

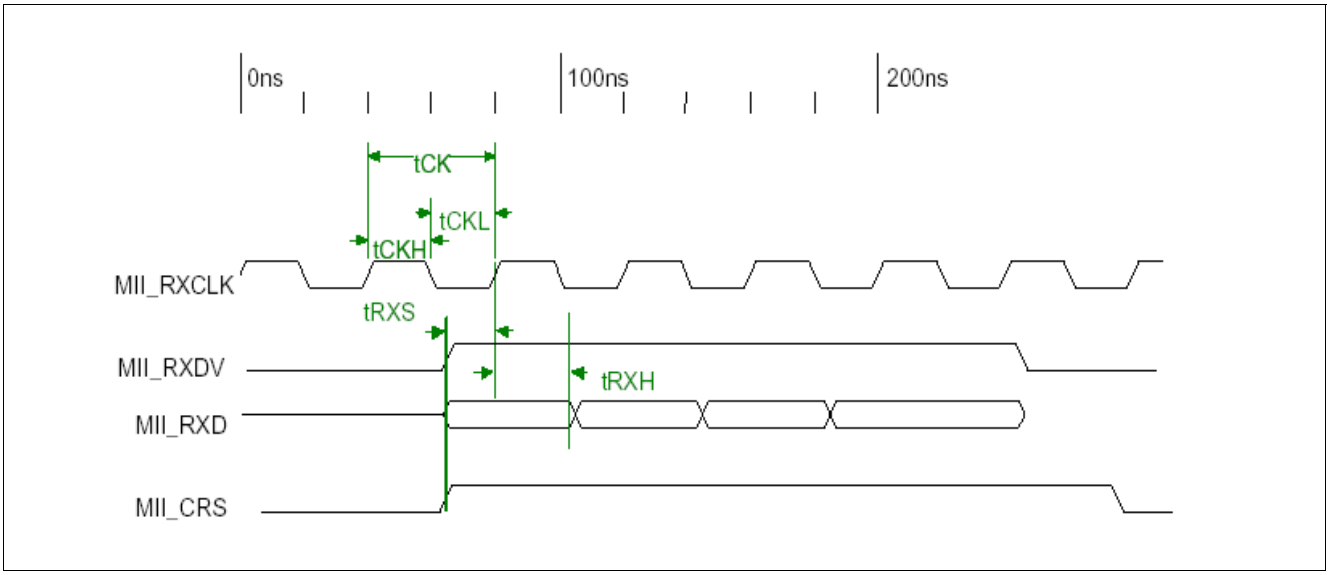

Figure 22 100Base-TX MII Input Timing

Table 84 100Base-TX MII Input Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MII_RXCLK Period	t_{CK}	–	40	–	ns	–
MII_RXCLK Low Period	t_{CKL}	18	–	22	ns	–
MII_RXCLK High Period	t_{CKH}	18	–	22	ns	–
MII_CRS, MII_RXDV and MII_RXD to MII_RXCLK rising setup	t_{RXS}	10	–	–	ns	–
MII_CRS, MII_RXDV and MII_RXD to MII_RXCLK rising hold	t_{RXH}	10	–	–	ns	–

5.3.7 100Base-TX MII Output Timing

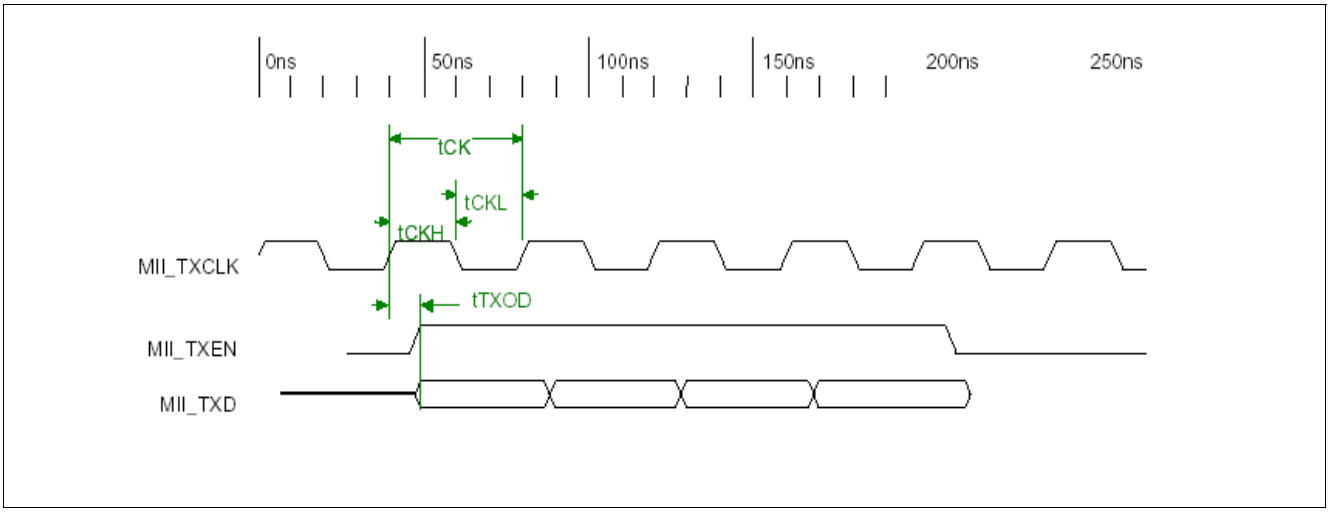

Figure 23 100Base-TX MII Output Timing

Table 85 100Base-TX MII Output Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MII_TXCLK Period	t_{CK}	–	40	–	ns	–
MII_TXCLK Low Period	t_{CKL}	18	–	22	ns	–
MII_TXCLK High Period	t_{CKH}	18	–	22	ns	–
MII_TXD, MII_TXEN to MII_TXCLK Rising Output Delay	t_{TXOD}	0	–	25	ns	–

5.3.8 RMII REFCLK Input Timing

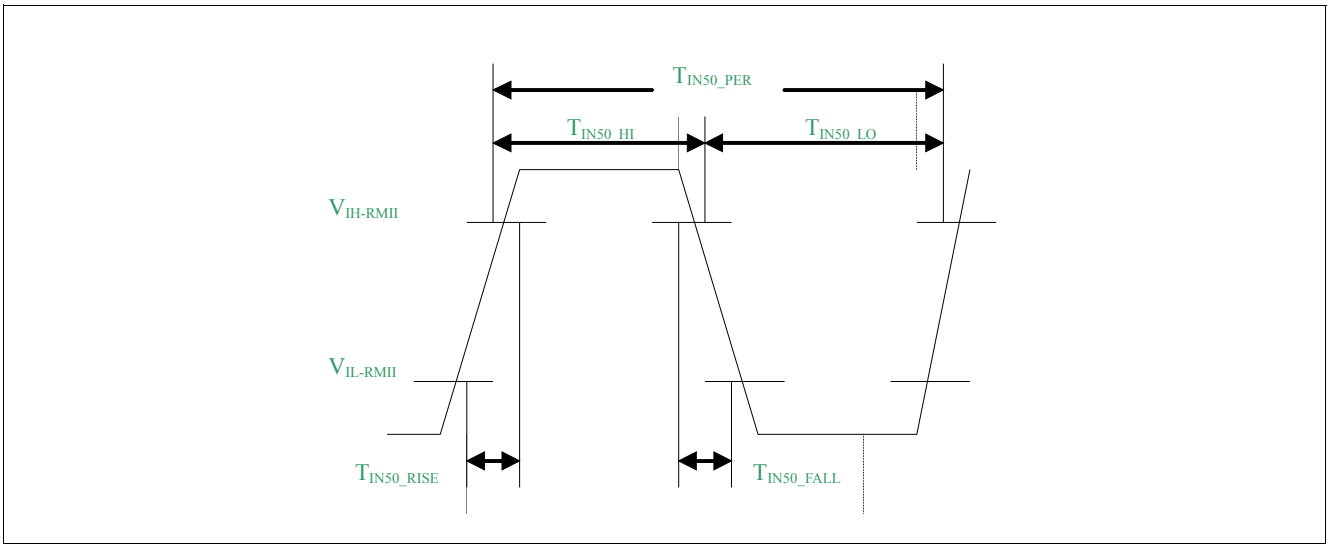

Figure 24 RMII REFCLK Input Timing

Table 86 RMII REFCLK Input Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
REFCLK Clock Period	t_{IN50_PER}	40.0 - 50ppm	40.0	40.0 + 50ppm	ns	–
REFCLK Clock High	t_{IN50_HI}	14	20.0	–	ns	–
REFCLK Clock Low	t_{IN50_LO}	14	20.0	–	ns	–
REFCLK Clock Rise Time, V_{IL} (max) to V_{IH} (min.)	t_{IN50_RISE}	–	–	2	ns	–
REFCLK Clock Fall Time, V_{IH} (min.) to V_{IL} (max)	t_{IN50_FALL}	–	–	2	ns	–

5.3.9 RMII REFCLK Output Timing

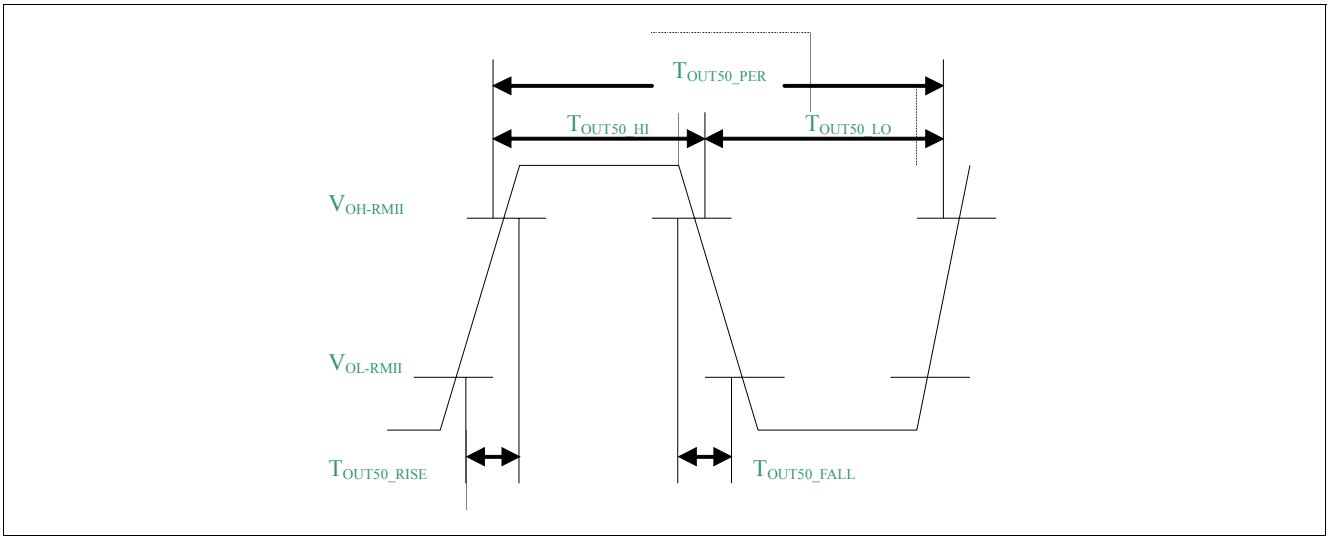

Figure 25 RMII REFCLK Output Timing

Table 87 RMII REFCLK Output Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
REFCLK Clock Period	t_{OUT50_PER}	40.0 - 50ppm	40.0	40.0 + 50ppm	ns	–
REFCLK Clock High	t_{OUT50_HI}	14	20.0	26	ns	–
REFCLK Clock Low	t_{OUT50_LO}	14	20.0	26	ns	–
REFCLK Clock Rise Time, V_{OL} (max) to V_{OH} (min.)	t_{OUT50_RISE}	–	–	2	ns	–
REFCLK Clock Fall Time, V_{OH} (min.) to V_{OL} (max)	t_{OUT50_FALL}	–	–	2	ns	–
REFCLK Clock Jittering (p-p)	t_{OUT50_JIT}	–	0.15	–	ns	–

5.3.10 Reduce MII Timing

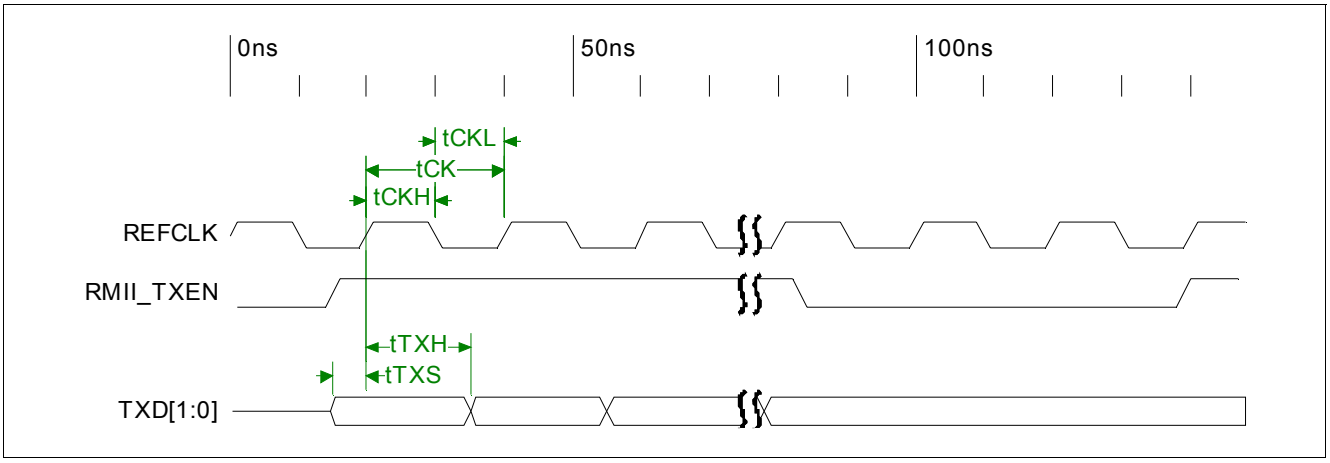

Figure 26 Reduce MII Timing (1 of 2)

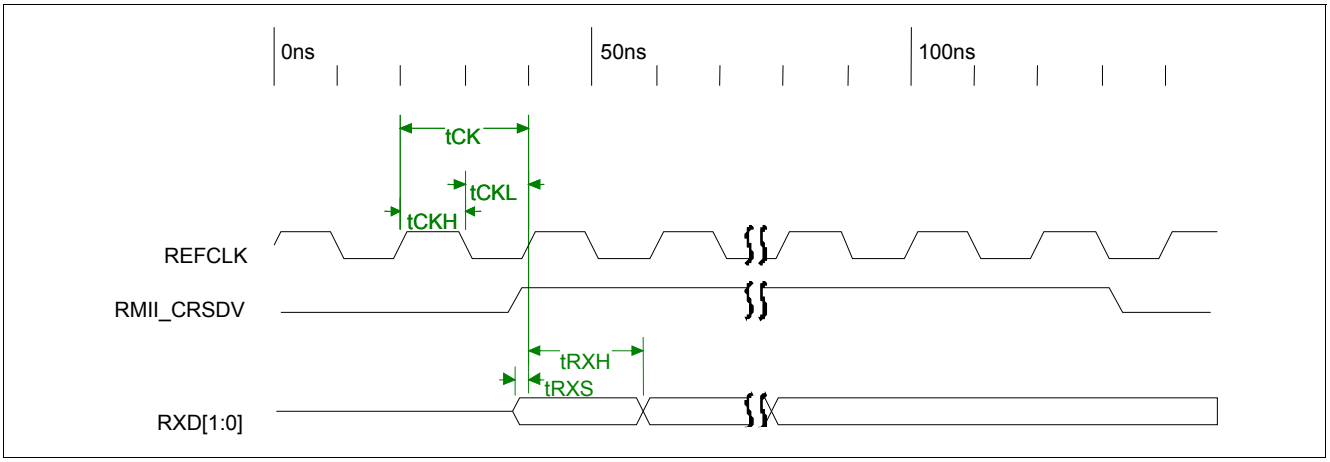

Figure 27 Reduce MII Timing (2 of 2)

Table 88 Reduce MII Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
RMII_REFCLK Period	t_{CK}	–	20	–	ns	–
RMII_REFCLK Low Period	t_{CKL}	–	10	–	ns	–
RMII_REFCLK High Period	t_{CKH}	–	10	–	ns	–
TXEN, TXD to REFCLK rising setup time	t_{TXS}	4	–	–	ns	–
TXE, TXD to REFCLK rising hold time	t_{TXH}	2	–	–	ns	–
CSRDV, RXD to REFCLK rising setup time	t_{RXS}	4	–	–		–
CRSDV, RXD to REFCLK rising hold time	t_{RXH}	2	–	–		–

5.3.11 GPSI (7-wire) Input Timing

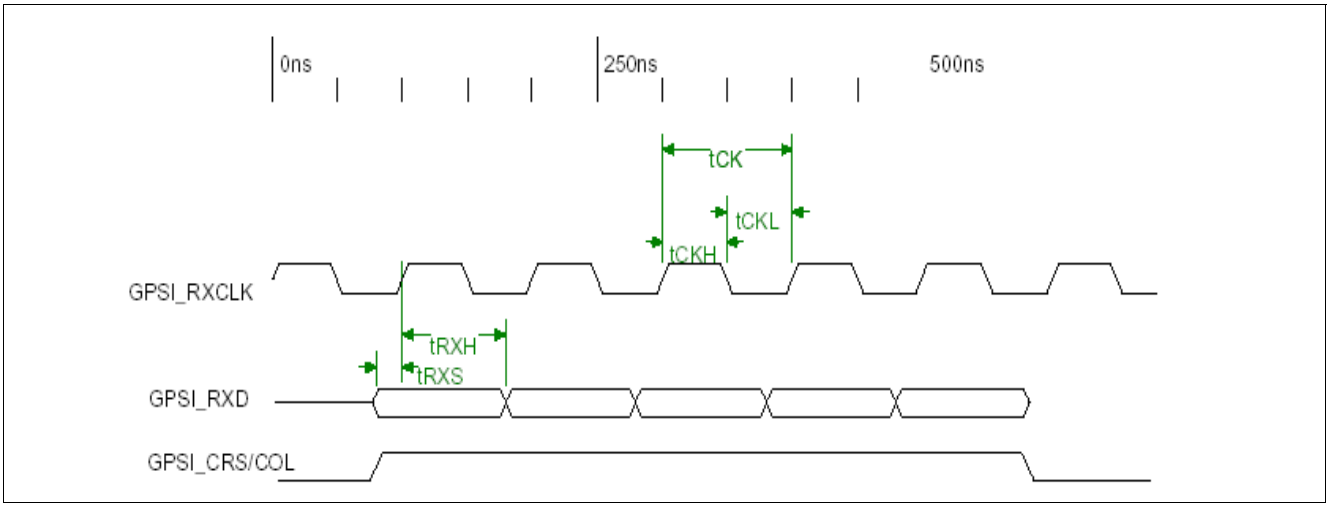

Figure 28 GPSI (7-wire) Input Timing

Table 89 GPSI (7-wire) Input Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
GPSI_RXCLK Period	t_{CK}	–	100	–	ns	–
GPSI_RXCLK Low Period	t_{CKL}	40	–	60	ns	–
GPSI_RXCLK High Period	t_{CKH}	40	–	60	ns	–
GPSI_RXD, GPSI_CRS/COL to GPSI_RXCLK Rising Setup Time	t_{RXS}	10	–	–	ns	–
GPSI_RXD, GPSI_CRS/COL to GPSI_RXCLK Rising HoldTime	t_{RXH}	10	–	–	ns	–

5.3.12 GPSI (7-wire) Output Timing

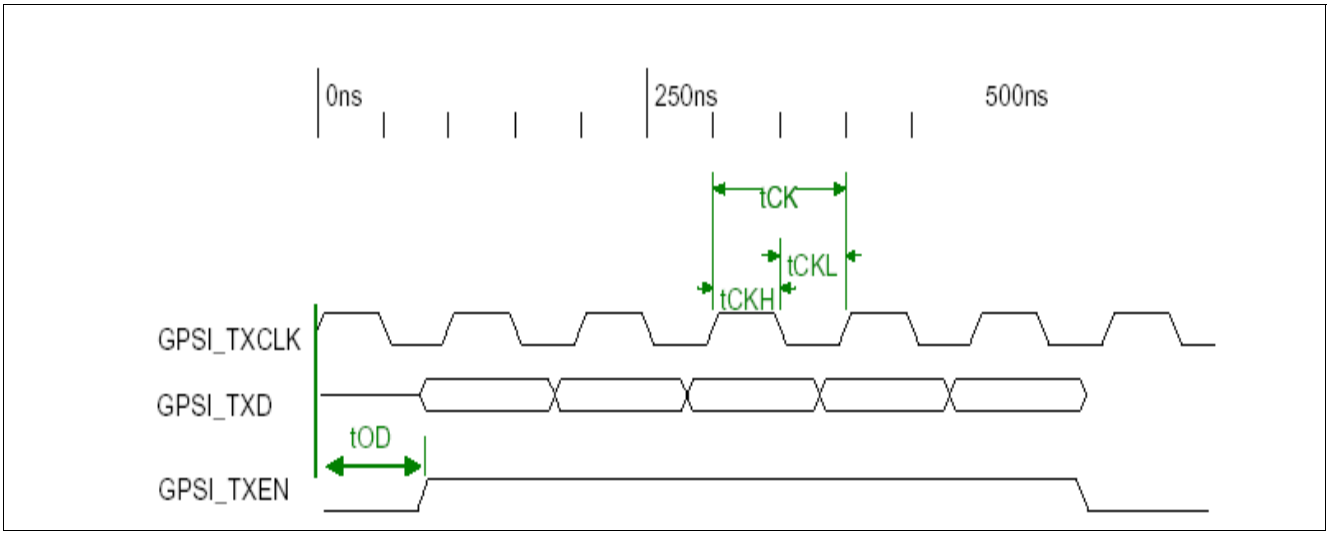

Figure 29 GPSI (7-wire) Output Timing

Table 90 GPSI (7-wire) Output Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
GPSI_TXCLK Period	t_{CK}	–	100	–	ns	–
GPSI_TXCLK Low Period	t_{CKL}	40	–	60	ns	–
GPSI_TXCLK High Period	t_{CKH}	40	–	60	ns	–
GPSI_TXCLK Rising to GPSI_TXEN/GPSI_TXD Output Delay	t_{OD}	50	–	70	ns	–

5.3.13 SDC/SDIO Timing

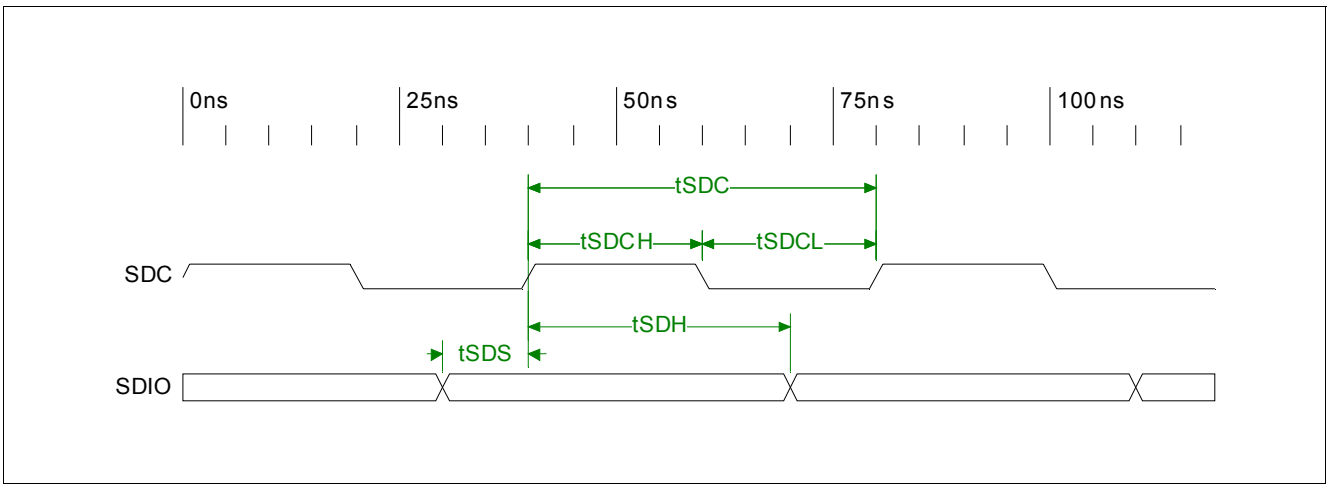

Figure 30 SDC/SDIO Timing

Table 91 SDC/SDIO Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
SDC Period	t_{CK}	20	–	–	ns	–
SDC Low Period	t_{CKL}	10	–	–	ns	–
SDC High Period	t_{CKH}	10	–	–	ns	–
SDIO to SDC rising setup time on read/write cycle	t_{SDS}	4	–	–	ns	–
SDIO to SDC rising hold time on read/write cycle	t_{SDH}	2	–	–	ns	–

NOTES :

1. DIMENSION D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PER SIDE. DIMENSIONS D1 AND E1 DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE -H-
2. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08mm TOTAL IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.

Figure 31 P-PQFP-128 Outside Dimension

6.1 Package Information

Product Name	Product Type	Package
6-Port 10/100 Mbit/s Single Chip Ethernet Switch Controller	Samurai-6I/IX, ADM6996I/IX-AD-T-1, Version AD	P-PQFP-128

Terminology

B	
BER	Bit Error Rate
C	
CFI	Canonical Format Indicator
COL	Collision
CRC	Cyclic Redundancy Check
CRS	Carrier Sense
CS	Chip Select
D	
DA	Destination Address
DI	Data Input
DO	Data Output
E	
EDI	EEPROM Data Input
EDO	EEPROM Data Output
EECS	EEPROM Chip Select
EESK	EEPROM Clock
ESD	End of Stream Delimiter
F	
FEFI	Far End Fault Indication
FET	Field Effect Transistor
FLP	Fast Link Pulse
G	
GND	Ground
GPSI	General Purpose Serial Interface
I	
IPG	Inter-Packet Gap
L	
LFSR	Linear Feedback Shift Register
M	
MAC	Media Access Controller
MDIX	MDI Crossover
MII	Media Independent Interface
N	
NRZI	Non Return to Zero Inverter
NRZ	Non Return to Zero
P	
PCS	Physical Coding Sub-layer
PHY	Physical Layer
PLL	Phase Lock Loop
PMA	Physical Medium Attachment

PMD	Physical Medium Dependent
Q	
QoS	Quality of Service
QFP	Quad Flat Package
R	
RST	Reset
RXCLK	Receive Clock
RXD	Receive Data
RXDV	Receive Data Valid
RXER	Receive Data Errors
RXN	Receive Negative (Analog receive differential signal)
RXP	Receive Positive (Analog receive differential signal)
S	
SA	Source Address
SOHO	Small Office Home Office
SSD	Start of Stream Delimiter
SQE	Signal Quality Error
T	
TOS	Type of Service
TP	Twisted Pair
TTL	Transistor Logic
TXCLK	Transmission Clock
TXD	Transmission Data
TXEN	Transmission Enable
TXN	Transmission Negative
TXP	Transmission Positive
