R1QAA7236ABG / R1QAA7218ABG / R1QAA7209ABG
R1QDA7236ABG / R1QDA7218ABG / R1QDA7209ABG

72-Mbit QDR™II+ SRAM
4-word Burst

Rev. 0.08a
2011.05.23

Description

The R1Q#A7236 is a 2,097,152-word by 36-bit, the R1Q#A7218 is a 4,194,304-word by 18-bit, and the R1Q#A7209 is a 8,388,608-word by 9-bit synchronous quad data rate static RAM fabricated with advanced CMOS technology using full CMOS six-transistor memory cell. It integrates unique synchronous peripheral circuitry and a burst counter. All input registers are controlled by an input clock pair (K and /K) and are latched on the positive edge of K and /K. These products are suitable for applications which require synchronous operation, high speed, low voltage, high density and wide bit configuration. These products are packaged in 165-pin plastic FBGA package.

= A: Read Latency =2.5, w/o ODT
= D: Read Latency =2.5, w/ ODT

Features

- Power Supply
  - 1.8 V for core (V_{DD}), 1.4 V to V_{DD} for I/O (V_{DDQ})
- Clock
  - Fast clock cycle time for high bandwidth
  - Two input clocks (K and /K) for precise DDR timing at clock rising edges only
  - Two output echo clocks (CQ and /CQ) simplify data capture in high-speed systems
  - Clock-stop capability with µs restart
- I/O
  - Separate independent read and write data ports with concurrent transactions
  - 100% bus utilization DDR read and write operation
  - HSTL I/O
  - User programmable output impedance
  - DLL circuitry for wide output data valid window and future frequency scaling
  - Data valid pin (QVLD) to indicate valid data on the output
- Function
  - Four-tick burst for reduced address frequency
  - Internally self-timed write control
  - Simple control logic for easy depth expansion
  - JTAG 1149.1 compatible test access port
- Package
  - 165 FBGA package (15 x 17 x 1.4 mm)

Notes: 1. QDR RAMs and Quad Data Rate RAMs comprise a new family of products developed by Cypress Semiconductor, IDT, Samsung, and Renesas Electronics Corp. (QDR Co-Development Team)
2. The specifications of this device are subject to change without notice. Please contact your nearest Renesas Electronics Sales Office regarding specifications.
3. Refer to "http://www.renesas.com/products/memory/fast_sram/qdr_sram/qdr_sram_root.jsp" for the latest and detailed information.

51					x36	R1Q M A72 36 A Bv- yy										

Notes:
1. "yy" represents the speed bin. "R1QAA7236ABG-20" can operate at 500 MHz(max) of frequency, for example.
2. "v" represents the package size. If "v" = "G" then size is 15 x 17 mm, and if "v" = "A" then 13 x 15 mm.

Pin Descriptions

Name	I/O type	Descriptions	Notes
SA	Input	Synchronous address inputs: These inputs are registered and must meet the setup and hold times around the rising edge of K. All transactions operate on a burst-of-four words (two clock periods of bus activity). These inputs are ignored when device is deselected.	
/R	Input	Synchronous read: When low, this input causes the address inputs to be registered and a READ cycle to be initiated. This input must meet setup and hold times around the rising edge of K, and is ignored on the subsequent rising edge of K.	
/W	Input	Synchronous write: When low, this input causes the address inputs to be registered and a WRITE cycle to be initiated. This input must meet setup and hold times around the rising edge of K, and is ignored on the subsequent rising edge of K.	
/BW_x	Input	Synchronous byte writes: When low, these inputs cause their respective byte to be registered and written during WRITE cycles. These signals are sampled on the same edge as the corresponding data and must meet setup and hold times around the rising edges of K and /K for each of the two rising edges comprising the WRITE cycle. See Byte Write Truth Table for signal to data relationship.	
K, /K	Input	Input clock: This input clock pair registers address and control inputs on the rising edge of K, and registers data on the rising edge of K and the rising edge of /K. /K is ideally 180 degrees out of phase with K. All synchronous inputs must meet setup and hold times around the clock rising edges. These balls cannot remain V_{REF} level.	
C, /C **(II only)**	Input	Output clock: This clock pair provides a user-controlled means of tuning device output data. The rising edge of /C is used as the output timing reference for the first and third output data. The rising edge of C is used as the output timing reference for second and fourth output data. Ideally, /C is 180 degrees out of phase with C. C and /C may be tied high to force the use of K and /K as the output reference clocks instead of having to provide C and /C clocks. If tied high, C and /C must remain high and not to be toggled during device operation. These balls cannot remain V_{REF} level.	1
/DOFF	Input	DLL disable: When low, this input causes the DLL to be bypassed for stable, low frequency operation.	
TMS TDI	Input	IEEE1149.1 test inputs: 1.8 V I/O levels. These balls may be left not connected if the JTAG function is not used in the circuit.	
TCK	Input	IEEE1149.1 clock input: 1.8 V I/O levels. This ball must be tied to V_{SS} if the JTAG function is not used in the circuit.	

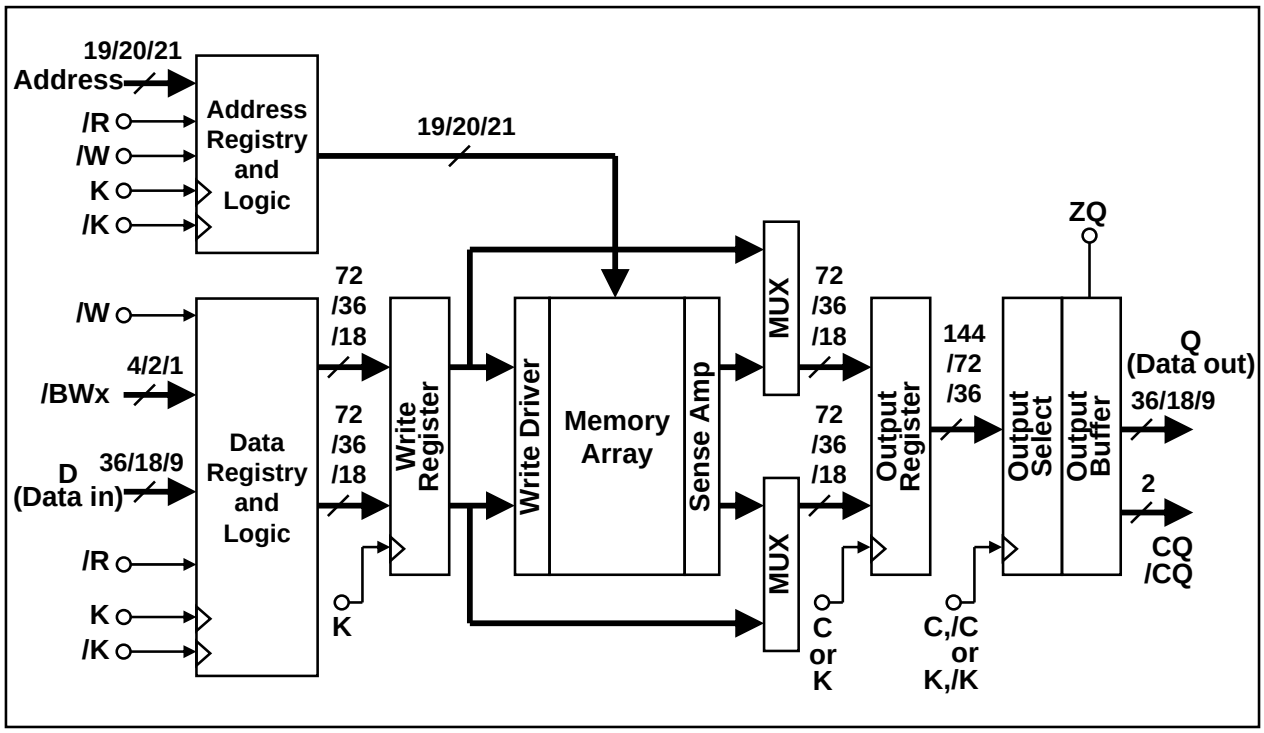
Notes:

1. R1Q2, R1Q3, R1Q4, R1Q5, R1Q6 series have C and /C pins. R1QA, R1QB, R1QC, R1QD, R1QE, R1QF, R1QG, R1QH, R1QJ, R1QK, R1QL, R1QM, R1QN, R1QP series do not have C, /C pins. In the series, K and /K are used as the output reference clocks instead of C and /C. Therefore, hereafter, C and /C represent K and /K in this document.

Name	I/O type	Descriptions	Notes
ZQ	Input	Output impedance matching input: This input is used to tune the device outputs to the system data bus impedance. Q and CQ output impedance are set to 0.2 × RQ, where RQ is a resistor from this ball to ground. This ball can be connected directly to V_{DDQ}, which enables the minimum impedance mode. This ball cannot be connected directly to V_{SS} or left unconnected. In ODT (On Die Termination) enable devices, the ODT termination values tracks the value of RQ. The ODT range is selected by ODT control input.	
ODT **(II+ only)**	Input	ODT control: When low; [Option 1] Low range mode is selected. The impedance range is between 52 Ω and 105 Ω (Thevenin equivalent), which follows 0.3 × RQ for 175 Ω < RQ < 350 Ω. [Option 2] ODT is disabled. When high; High range mode is selected. The impedance range is between 105 Ω and 150 Ω (Thevenin equivalent), which follows 0.6 × RQ for 175 Ω < RQ < 250 Ω. When floating; [Option 1] High range mode is selected. [Option 2] ODT is disabled.	1
D_0 to D_n	Input	Synchronous data inputs: Input data must meet setup and hold times around the rising edges of K and /K during WRITE operations. See Pin Arrangement figures for ball site location of individual signals. The ×9 device uses D0~D8. D9~D35 should be treated as NC pin. The ×18 device uses D0~D17. D18~D35 should be treated as NC pin. The ×36 device uses D0~D35.	
CQ, /CQ	Output	Synchronous echo clock outputs: The edges of these outputs are tightly matched to the synchronous data outputs and can be used as a data valid indication. These signals run freely and do not stop when Q tri-states.	
TDO	Output	IEEE 1149.1 test output: 1.8 V I/O level.	
Q_0 to Q_n	Output	Synchronous data outputs: Output data is synchronized to the respective C and /C, or to the respective K and /K if C and /C are tied high. This bus operates in response to /R commands. See Pin Arrangement figures for ball site location of individual signals. The ×9 device uses Q0~Q8. Q9~Q35 should be treated as NC pin. The ×18 device uses Q0~Q17. Q18~Q35 should be treated as NC pin. The ×36 device uses Q0~Q35.	
QVLD **(II+ only)**	Output	Valid output indicator: The Q Valid indicates valid output data. QVLD is edge aligned with CQ and /CQ.	
V_{DD}	Supply	Power supply: 1.8 V nominal. See DC Characteristics and Operating Conditions for range.	2
V_{DDQ}	Supply	Power supply: Isolated output buffer supply. Nominally 1.5 V. See DC Characteristics and Operating Conditions for range.	2
V_{SS}	Supply	Power supply: Ground.	2
V_{REF}	—	HSTL input reference voltage: Nominally V_{DDQ}/2, but may be adjusted to improve system noise margin. Provides a reference voltage for the HSTL input buffers.	
NC	—	No connect: These pins can be left floating or connected to 0V ~ V_{DDQ}.	

Notes:
1. Renesas status: Option 1 = Available, Option 2 = Possible.
2. All power supply and ground balls must be connected for proper operation of the device.

Block Diagram (R1QxA7236 / R1QxA7218 / R1QxA7209, x=3,A,D,G,K)



Notes

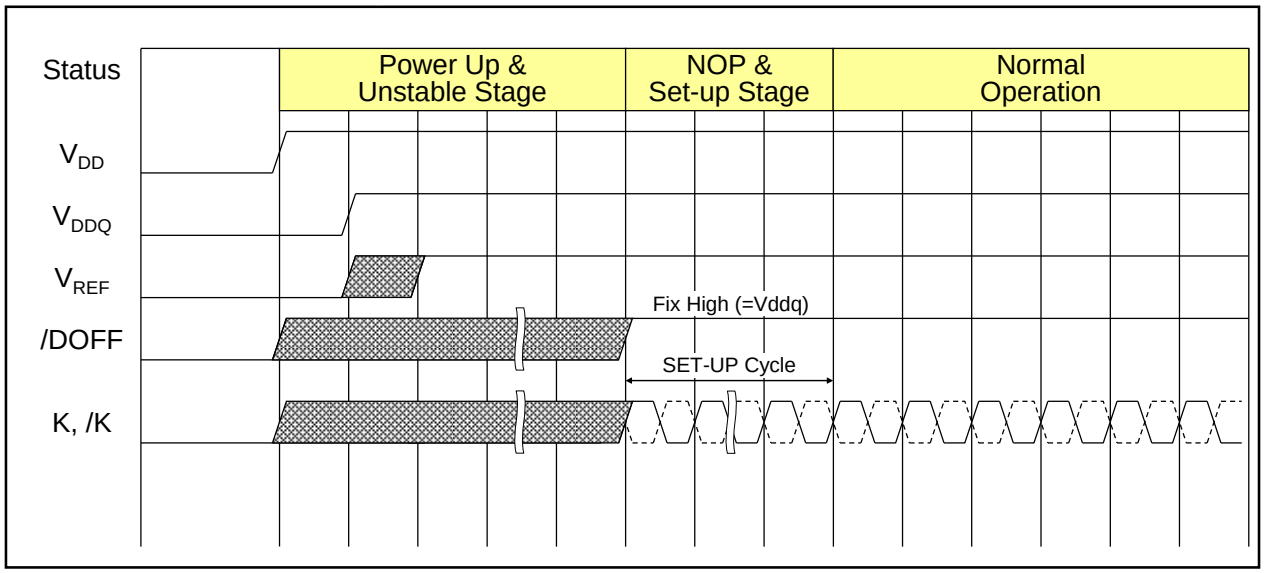
1. C and /C pins do not exist in II+ series parts.

General Description

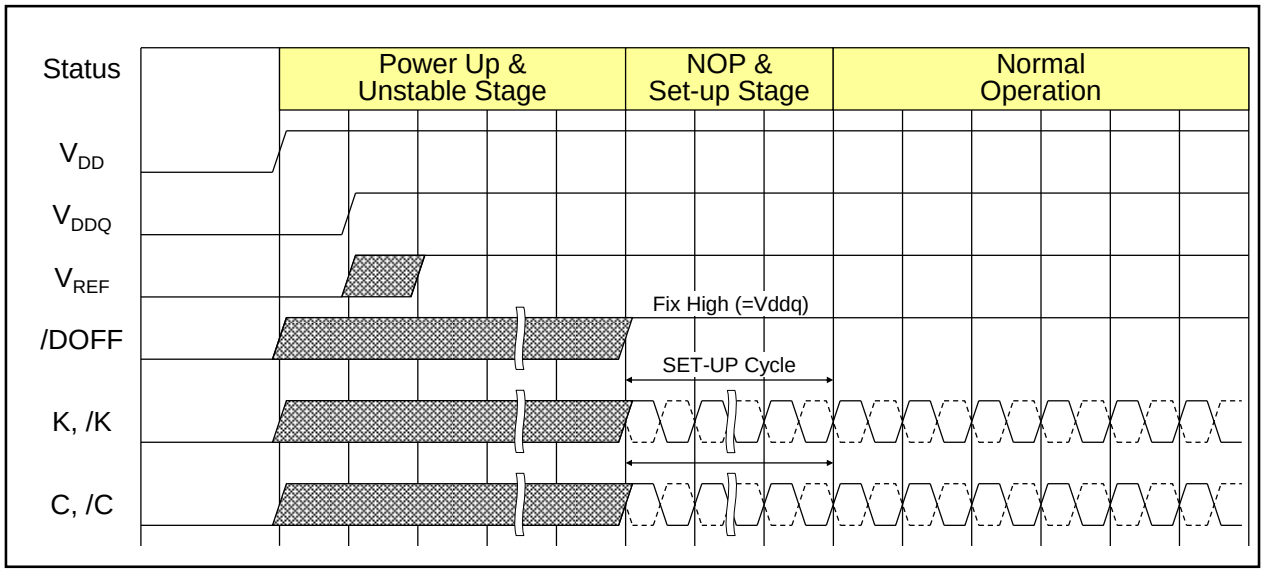
Power-up and Initialization Sequence

- V_{DD} must be stable before K, /K clocks are applied.
- Recommended voltage application sequence : $V_{SS} \rightarrow V_{DD} \rightarrow V_{DDQ}$ & $V_{REF} \rightarrow V_{IN}$. (0 V to V_{DD}, V_{DDQ} < 200 ms)
- Apply V_{REF} after V_{DDQ} or at the same time as V_{DDQ}.
- Then execute either one of the following three sequences.

1. Single Clock Mode (C and /C tied high)
   - Drive /DOFF high (/DOFF can be tied high from the start).
   - Then provide stable clocks (K, /K) for at least 1024 cycles (II series) or 20 us (II+ series).
     These meet the QDR common specification of 20 us.
     When the operating frequency is less than 180 MHz, 2048 cycles are required (II series).



2. Double Clock Mode (C and /C control outputs) (II series only)
   - Drive /DOFF high (/DOFF can be tied high from the start)
   - Then provide stable clocks (K, /K , C, /C) for at least 1024 cycles (II series).
     This meets the QDR common specification of 20 us.
     When the operating frequency is less than 180 MHz, 2048 cycles are required (II series).



3. DLL Off Mode (/DOFF tied low)
   - In the "NOP and setup stage", provide stable clocks (K, /K) for at least 1024 cycles (II series) or 20 us (II+ series). These meet the QDR common specification of 20 us.

DLL Constraints

1. DLL uses K clock as its synchronizing input. The input should have low phase jitter which is specified as tKC var.

2. The lower end of the frequency at which the DLL can operate is 120 MHz.
   (Please refer to AC Characteristics table for detail.)

3. When the operating frequency is changed or /DOFF level is changed, setup cycles are required again.

Programmable Output Impedance

1. Output buffer impedance can be programmed by terminating the ZQ ball to V_{SS} through a precision resistor (RQ). The value of RQ is five times the output impedance desired. The allowable range of RQ to guarantee impedance matching with a tolerance of 15% is 250 Ω typical. The total external capacitance of ZQ ball must be less than 7.5 pF.

QVLD (Valid data indicator)

(R1QA, R1QB, R1QC, R1QD, R1QE, R1QF, R1QG, R1QH, R1QJ, R1QK, R1QL, R1QM R1QN, R1QP series)

1. QVLD is provided on the QDR-II+ and DDR-II+ to simplify data capture on high speed systems. The Q Valid indicates valid output data. QVLD is activated half cycle before the read data for the receiver to be ready for capturing the data. QVLD is inactivated half cycle before the read finish for the receiver to stop capturing the data. QVLD is edge aligned with CQ and /CQ.

ODT (On Die Termination)

(R1QD, R1QE, R1QF, R1QK, R1QL, R1QM, R1QP series)

1. To reduce reflection which produces noise and lowers signal quality, the signals should be terminated, especially at high frequency. Renesas offers ODT on the input signals to QDR-II+ and DDR-II+ family of devices. (See the ODT pin table)
2. In ODT enable devices, the ODT termination values tracks the value of RQ. The ODT range is selected by ODT control input. (See the ODT range table)
3. In DDR-II+ devices having common I/O bus, ODT is automatically enabled when the device inputs data and disabled when the device outputs data.
4. There is no difference in AC timing characteristics between the SRAMs with ODT and SRAMs without ODT.
5. There is no increase in the I_{DD} of SRAMs with ODT, however, there is an increase in the I_{DDQ} (current consumption from the I/O voltage supply) with ODT.

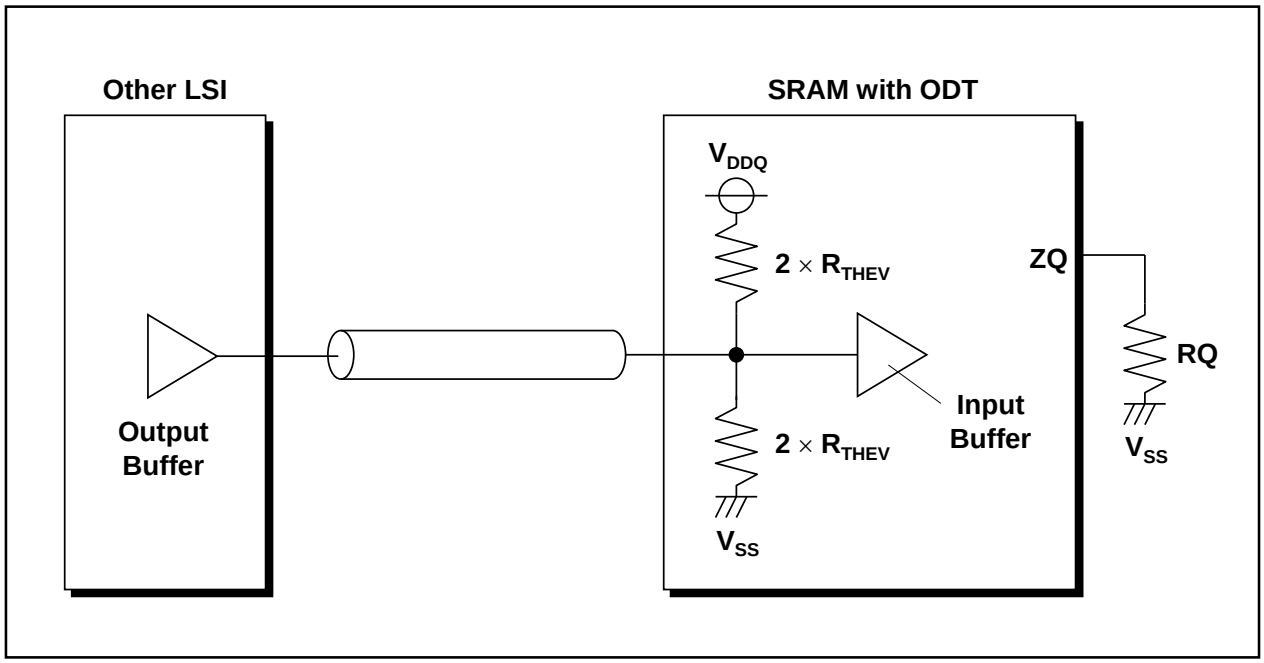
ODT range

ODT control pin	Thevenin equivalent resistance (R_{THEV})		Unit	Notes
	Option 1	Option 2	-	6
Low	0.3 × RQ	(ODT disable)	Ω	1, 4
High	0.6 × RQ	0.6 × RQ	Ω	2, 5
Floating	0.6 × RQ	(ODT disable)	Ω	3

Notes:

1. Allowable range of RQ for Option 1 to guarantee impedance matching a tolerance of ± 20 % is 175 Ω < RQ < 350 Ω.
2. Allowable range of RQ to guarantee impedance matching a tolerance of ± 20 % is 175 Ω < RQ < 250 Ω.
3. Allowable range of RQ for Option 1 to guarantee impedance matching a tolerance of ± 20 % is 175 Ω < RQ < 250 Ω.
4. At option 1, ODT control pin is connected to V_{DDQ} through 3.5 kΩ. Therefore it is recommended to connect it to V_{SS} through less than 100 Ω to make it low.
5. At option 2, ODT control pin is connected to V_{SS} through 3.5 kΩ. Therefore it is recommended to connect it to V_{DDQ} through less than 100 Ω to make it high.
6. Renesas status: Option 1 = Available, Option 2 = Possible. If you need devices with option 2, please contact Renesas sales office.

Thevenin termination

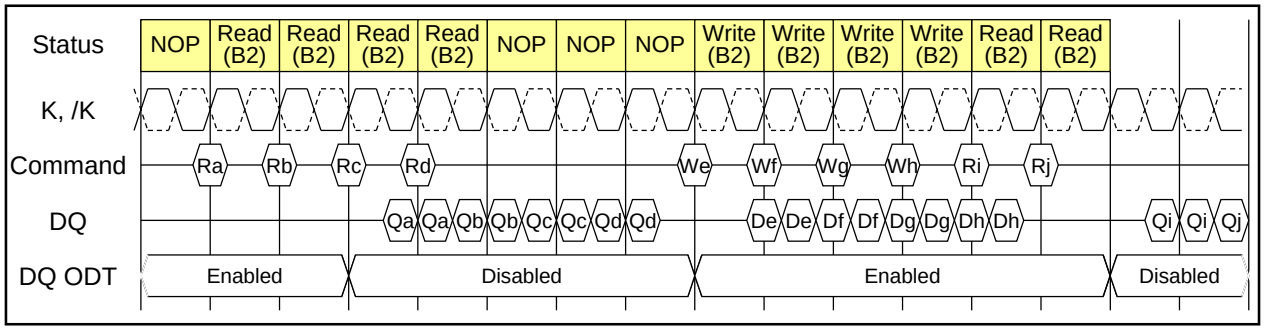


ODT pin (R1QD, R1QE, R1QF, R1QK, R1QL, R1QM, R1QP series)

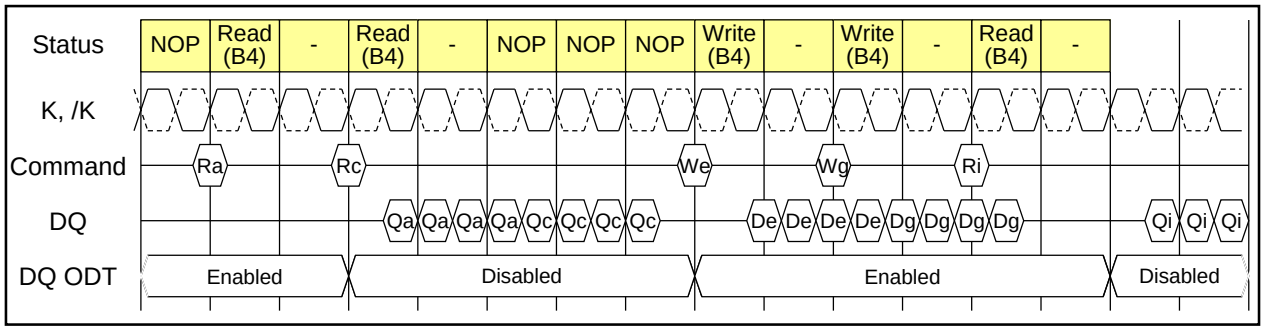
Pin name	Pin with ODT		ODT On/Off timing	Notes
	Option 1	Option 2	-	3
D_0 ~ D_n in separate I/O devices	Yes	Yes	Always On	1
DQ_0 ~ DQ_n in common I/O devices			Off: First Read Command + Read Latency - 0.5 cycle On: Last Read Command + Read Latency + BL/2 cycle + 0.5 cycle (See below timing chart)	2
/BW_x	Yes	Yes	Always On	
K, /K	Yes	No	Always On (@ Option 1) Always Off (@ Option 2)	

Notes:
1. Separate I/O devices are R1QD, R1QK, R1QP series.
2. Common I/O devices are R1QE, R1QF, R1QL, R1QM series.
3. Renesas status: Option 1 = Available, Option 2 = Possible. If you need devices with option 2, please contact Renesas sales office.

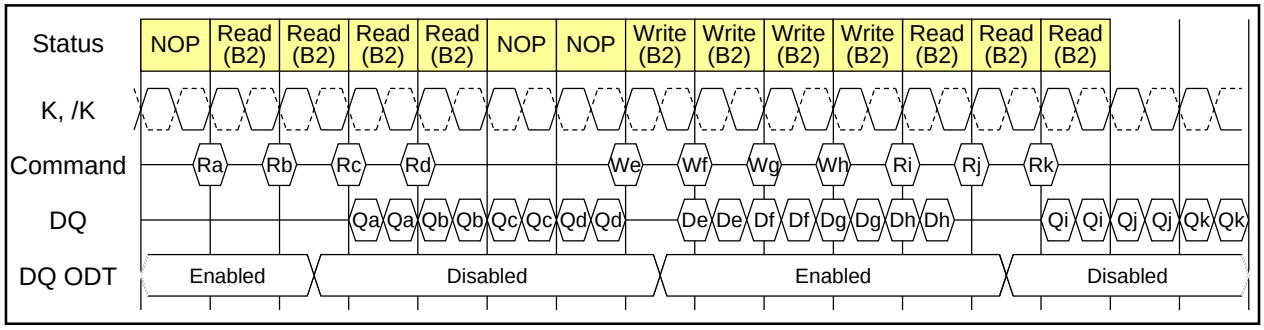
ODT on/off Timing Chart for R1QE series (DDR II+, Burst Length=2, Read Latency=2.5 cycle)



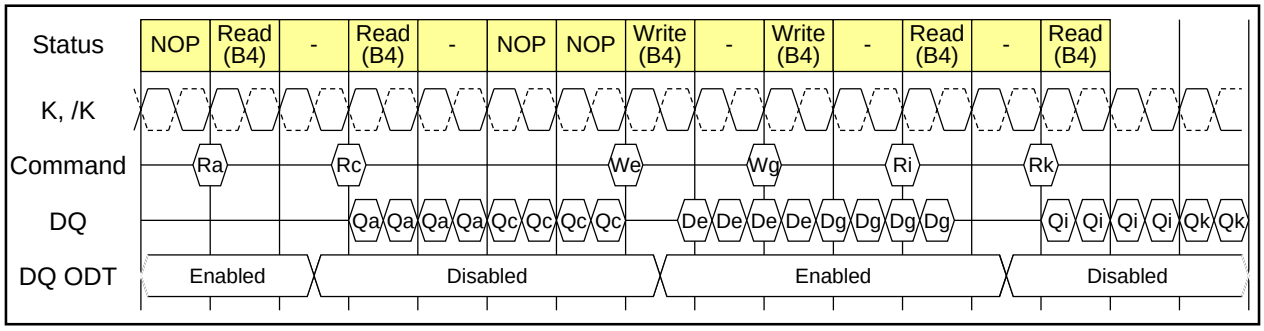
ODT on/off Timing Chart for R1QF series (DDR II+, Burst Length=4, Read Latency=2.5 cycle)



ODT on/off Timing Chart for R1QL series (DDR II+, Burst Length=2, Read Latency=2.0 cycle)



ODT on/off Timing Chart for R1QM series (DDR II+, Burst Length=4, Read Latency=2.0 cycle)



Notes

1. ODT on/off switching timings are edge aligned with CQ or /CQ.

K Truth Table

Operation	K	/R	/W	D or Q				
Write Cycle: Load address, input write data on two consecutive K and /K rising edges	↑	H*7	L*8	Data in				
				Input data		D(A+0)	D(A+1)	D(A+2)	D(A+3)
				Input clock		K(t+1)↑	/K(t+1)↑	K(t+2)↑	/K(t+2)↑
Read Cycle: Load address, output read data on two consecutive C and /C rising edges	↑	L*8	×	Data out				
				Output data		Q(A+0)	Q(A+1)	Q(A+2)	Q(A+3)
				Input clock for Q	RL*9=1.5	/C(t+1)↑	C(t+2)↑	/C(t+2)↑	C(t+3)↑
					RL=2.0	C(t+2)↑	/C(t+2)↑	C(t+3)↑	/C(t+3)↑
					RL=2.5	/C(t+2)↑	C(t+3)↑	/C(t+3)↑	C(t+4)↑
NOP (No operation)	↑	H	H	D = × or Q = High-Z					
Standby (Clock stopped)	Stopped	×	×	Previous state					

Notes:

1. H: high level, L: low level, ×: don't care, ↑: rising edge.
2. Data inputs are registered at K and /K rising edges. Data outputs are delivered at C and /C rising edges, except if C and /C are high, then data outputs are delivered at K and /K rising edges.
3. /R and /W must meet setup/hold times around the rising edges (low to high) of K and are registered at the rising edge of K.
4. This device contains circuitry that will ensure the outputs will be in high-Z during power-up.
5. Refer to state diagram and timing diagrams for clarification.
6. When clocks are stopped, the following cases are recommended; the case of K = low, /K = high, C = low and /C = high, or the case of K = high, /K = low, C = high and /C = low. This condition is not essential, but permits most rapid restart by overcoming transmission line charging symmetrically.
7. If this signal was low to initiate the previous cycle, this signal becomes a "don't care" for this operation; however, it is strongly recommended that this signal be brought high, as shown in the truth table.
8. This signal was high on previous K clock rising edge. Initiating consecutive READ or WRITE operations on consecutive K clock rising edges is not permitted. The device will ignore the second request.
9. RL = Read Latency (unit = cycle).

Byte Write Truth Table (x 36)

Operation	K	/K	/BW0	/BW1	/BW2	/BW3
Write D0 to D35	↑	-	L	L	L	L
	-	↑	L	L	L	L
Write D0 to D8	↑	-	L	H	H	H
	-	↑	L	H	H	H
Write D9 to D17	↑	-	H	L	H	H
	-	↑	H	L	H	H
Write D18 to D26	↑	-	H	H	L	H
	-	↑	H	H	L	H
Write D27 to D35	↑	-	H	H	H	L
	-	↑	H	H	H	L
Write nothing	↑	-	H	H	H	H
	-	↑	H	H	H	H

Notes:
1. H: high level, L: low level, ↑: rising edge.
2. Assumes a WRITE cycle was initiated. /BWx can be altered for any portion of the BURST WRITE operation provided that the setup and hold requirements are satisfied.

Byte Write Truth Table (x 18)

Operation	K	/K	/BW0	/BW1
Write D0 to D17	↑	-	L	L
	-	↑	L	L
Write D0 to D8	↑	-	L	H
	-	↑	L	H
Write D9 to D17	↑	-	H	L
	-	↑	H	L
Write nothing	↑	-	H	H
	-	↑	H	H

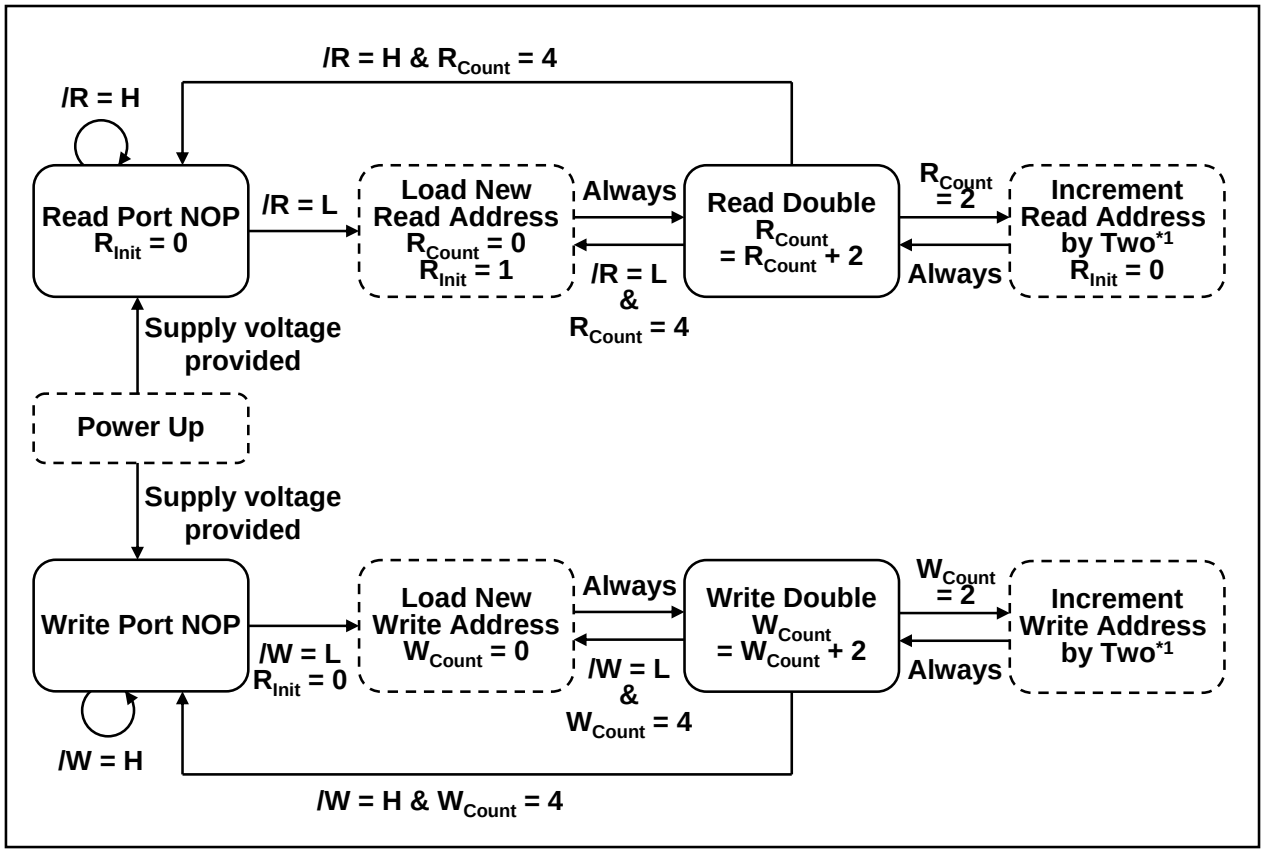
Notes:
1. H: high level, L: low level, ↑: rising edge.
2. Assumes a WRITE cycle was initiated. /BWx can be altered for any portion of the BURST WRITE operation provided that the setup and hold requirements are satisfied.

Byte Write Truth Table (x 9)

Operation	K	/K	/BW
Write D0 to D8	↑	-	L
	-	↑	L
Write nothing	↑	-	H
	-	↑	H

Notes:
1. H: high level, L: low level, ↑: rising edge.
2. Assumes a WRITE cycle was initiated. /BWx can be altered for any portion of the BURST WRITE operation provided that the setup and hold requirements are satisfied.

Bus Cycle State Diagram



Notes:

1. The address is concatenated with two additional internal LSBs to facilitate burst operation. The address order is always fixed as: xxx…xxx+0, xxx…xxx+1, xxx…xxx+2, xxx…xxx+3. Bus cycle is terminated at the end of this sequence (burst count = 4).
2. Read and write state machines can be active simultaneously. Read and write cannot be simultaneously initiated. Read takes precedence.
3. State machine control timing sequence is controlled by K.

Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit	Notes
Input voltage on any ball	V_{IN}	–0.5 to V_{DD} + 0.5 (2.5 V max.)	V	1, 4
Input/output voltage	$V_{I/O}$	–0.5 to V_{DDQ} + 0.5 (2.5 V max.)	V	1, 4
Core supply voltage	V_{DD}	–0.5 to 2.5	V	1, 4
Output supply voltage	V_{DDQ}	–0.5 to V_{DD}	V	1, 4
Junction temperature	Tj	+125 (max)	°C	5
Storage temperature	T_{STG}	–55 to +125	°C	

Notes:

1. All voltage is referenced to V_{SS}.
2. Permanent device damage may occur if Absolute Maximum Ratings are exceeded. Functional operation should be restricted the Operation Conditions. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.
3. These CMOS memory circuits have been designed to meet the DC and AC specifications shown in the tables after thermal equilibrium has been established.
4. The following supply voltage application sequence is recommended: V_{SS}, V_{DD}, V_{DDQ}, V_{REF} then V_{IN}. Remember, according to the Absolute Maximum Ratings table, V_{DDQ} is not to exceed 2.5 V, whatever the instantaneous value of V_{DDQ}.
5. Some method of cooling or airflow should be considered in the system. (Especially for high frequency or ODT parts)

Recommended DC Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Power supply voltage -- core	V_{DD}	1.7	1.8	1.9	V	1
Power supply voltage -- I/O	V_{DDQ}	1.4	1.5	V_{DD}	V	1, 2
Input reference voltage -- I/O	V_{REF}	0.68	0.75	0.95	V	3
Input high voltage	$V_{IH\ (DC)}$	V_{REF} + 0.1	—	V_{DDQ} + 0.3	V	1, 4, 5
Input low voltage	$V_{IL\ (DC)}$	–0.3	—	V_{REF} – 0.1	V	1, 4, 5

Notes:

1. At power-up, V_{DD} and V_{DDQ} are assumed to be a linear ramp from 0V to V_{DD}(min.) or V_{DDQ}(min.) within 200ms. During this time $V_{DDQ} < V_{DD}$ and $V_{IH} < V_{DDQ}$.
   During normal operation, V_{DDQ} must not exceed V_{DD}.
2. Please pay attention to Tj not to exceed the temperature shown in the absolute maximum ratings table due to current from V_{DDQ}.
3. Peak to peak AC component superimposed on V_{REF} may not exceed 5% of V_{REF}.
4. These are DC test criteria. The AC V_{IH} / V_{IL} levels are defined separately to measure timing parameters.
5. Overshoot: $V_{IH\ (AC)} \leq V_{DDQ}$ + 0.5 V for $t \leq t_{KHKH}/2$
   Undershoot: $V_{IL\ (AC)} \geq$ –0.5 V for $t \leq t_{KHKH}/2$
   During normal operation, $V_{IH(DC)}$ must not exceed V_{DDQ} and $V_{IL(DC)}$ must not be lower than V_{SS}.

DC Characteristics

(Ta = 0 ~ +70°C @ R1Q*A*****BG-**R** series, Ta = -40 ~ +85°C @ R1Q*A*****BG-**I** series)
(V_{DD} = 1.8V ±0.1V, V_{DDQ} = 1.5V, V_{REF} = 0.75V)

Operating Supply Current (Write / Read)

Symbol = I_{DD}. Unit = mA. See Notes 1, 2 and 3 in the page after next.

No	Product Type	Burst Length	Latency (Cycle)	ODT	Organi-zation	Frequency (max) (MHz)	QDR II+ / DDR II+						QDR II / DDR II

51					x36	R1Q M A72 36 A Bv- yy				630						

Notes:
1. "yy" represents the speed bin. "R1QAA7236ABG-20" can operate at 500 MHz(max) of frequency, for example.
2. "v" represents the package size. If "v" = "G" then size is 15 x 17 mm, and if "v" = "A" then 13 x 15 mm.

Leakage Currents & Output Voltage

Parameter	Symbol	Min	Max	Unit	Test condition	Notes
Input leakage current	I_{LI}	–2	2	µA		10
Output leakage current	I_{LO}	–5	5	µA		11
Output high voltage	V_{OH} (Low)	V_{DDQ} – 0.2	V_{DDQ}	V	$\|I_{OH}\| \le 0.1$ mA	8, 9
	V_{OH}	$V_{DDQ}/2$ – 0.12	$V_{DDQ}/2$ + 0.12	V	Note 6	8, 9
Output low voltage	V_{OL} (Low)	V_{SS}	0.2	V	$I_{OL} \le 0.1$ mA	8, 9
	V_{OL}	$V_{DDQ}/2$ – 0.12	$V_{DDQ}/2$ + 0.12	V	Note 7	8, 9

Notes:

1. All inputs (except ZQ, V_{REF}) are held at either V_{IH} or V_{IL}.
2. I_{OUT} = 0 mA. $V_{DD} = V_{DD}$ max, $t_{KHKH} = t_{KHKH}$ min.
3. Operating supply currents (I_{DD}) are measured at 100% bus utilization. I_{DD} of QDR family is current of device with 100% write and 100% read cycle. I_{DD} of DDR family is current of device with 100% write cycle (if I_{DD}(Write) > I_{DD}(Read)) or 100% read cycle (if I_{DD}(Write) < I_{DD}(Read)).
4. All address / data inputs are static at either $V_{IN} > V_{IH}$ or $V_{IN} < V_{IL}$.
5. Reference value. (Condition = NOP currents are valid when entering NOP after all pending READ and WRITE cycles are completed.)
6. Outputs are impedance-controlled. $|I_{OH}| = (V_{DDQ}/2)/(RQ/5)$ for values of 175 Ω ≤ RQ ≤ 350 Ω.
7. Outputs are impedance-controlled. $I_{OL} = (V_{DDQ}/2)/(RQ/5)$ for values of 175 Ω ≤ RQ ≤ 350 Ω.
8. AC load current is higher than the shown DC values. AC I/O curves are available upon request.
9. HSTL outputs meet JEDEC HSTL Class I and Class II standards.
10. $0 \le V_{IN} \le V_{DDQ}$ for all input balls (except V_{REF}, ZQ, TCK, TMS, TDI ball).
    If R1QD, R1QE, R1QF, R1QK, R1QL, R1QM, R1QP series, balls with ODT do not follow this spec.
11. $0 \le V_{OUT} \le V_{DDQ}$ (except TDO ball), output disabled.

Thermal Resistance

Parameter	Symbol	Airflow	Typ	Unit	Test condition	Notes
Junction to Ambient	θ_{JA}	1 m/s	11.0	°C/W	EIA/JEDEC JESD51	1
Junction to Case	θ_{JC}	-	4.4			

Notes:

1. These parameters are calculated under the condition. These are reference values.
2. $Tj = Ta + \theta_{JA} \times Pd$

   $Tj = Tc + \theta_{JC} \times Pd$

   where

   Tj : junction temperature when the device has achieved a steady-state after application of Pd (°C)

   Ta : ambient temperature (°C)

   Tc : temperature of external surface of the package or case (°C)

   θ_{JA} : thermal resistance from junction-to-ambient (°C/W)

   θ_{JC} : thermal resistance from junction-to-case (package) (°C/W)

   Pd : power dissipation that produced change in junction temperature (W) (cf.JESD51-2A)

Capacitance

(Ta = +25°C, Frequency = 1.0MHz, V_{DD} = 1.8V, V_{DDQ} = 1.5V)

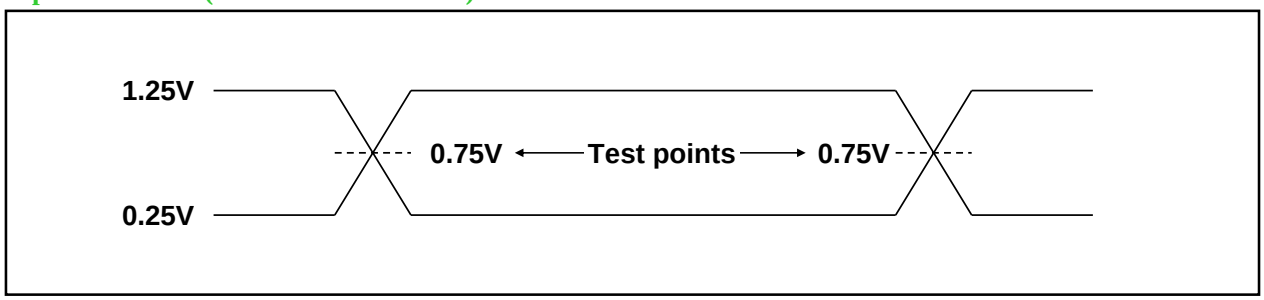
Parameter	Symbol	Min	Typ	Max	Unit	Test condition	Notes
Input capacitance (SA, /R, /W, /BW, D(separate))	C_{IN}	—	4	5	pF	V_{IN} = 0 V	1, 2
Clock input capacitance (K, /K, C, /C)	C_{CLK}	—	4	5	pF	V_{CLK} = 0 V	1, 2
Output capacitance (Q(separate), DQ(common), CQ, /CQ)	$C_{I/O}$	—	5	6	pF	$V_{I/O}$ = 0 V	1, 2

Notes:

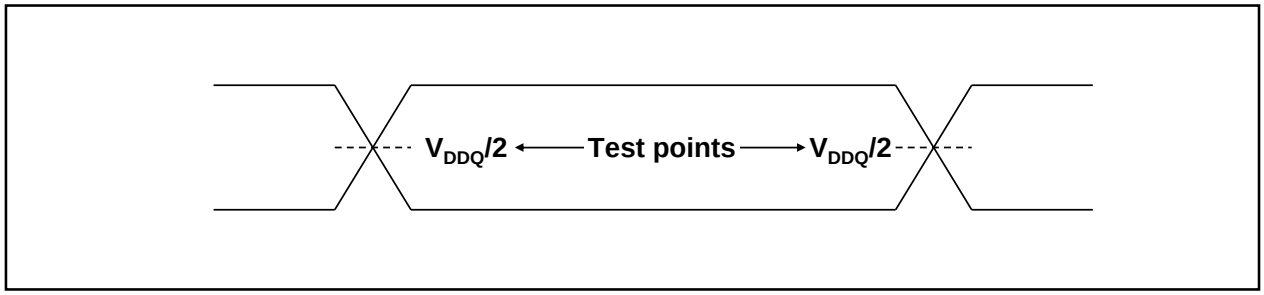
1. These parameters are sampled and not 100% tested.
2. Except JTAG (TCK, TMS, TDI, TDO) pins.

AC Test Conditions

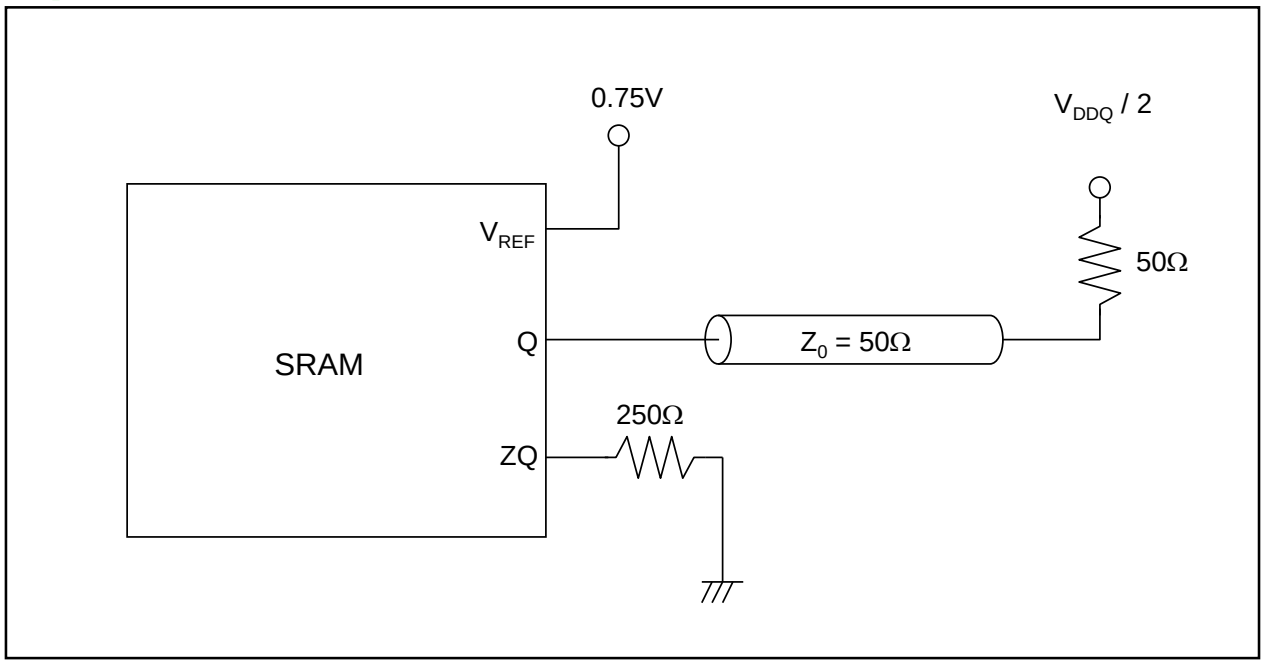
Input waveform (Rise/fall time ≤ 0.3 ns)



Output waveform



Output load conditions



AC Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Input high voltage	$V_{IH\ (AC)}$	V_{REF} + 0.2	—	—	V	1, 2, 3, 4
Input low voltage	$V_{IL\ (AC)}$	—	—	V_{REF} – 0.2	V	1, 2, 3, 4

Notes:

1. All voltages referenced to V_{SS} (GND).
   During normal operation, V_{DDQ} must not exceed V_{DD}.
2. These conditions are for AC functions only, not for AC parameter test.
3. Overshoot: $V_{IH\ (AC)} \leq V_{DDQ}$ + 0.5 V for $t \leq t_{KHKH}/2$
   Undershoot: $V_{IL\ (AC)} \geq -0.5$ V for $t \leq t_{KHKH}/2$
   Control input signals may not have pulse widths less than t_{KHKL} (min) or operate at cycle rates less than t_{KHKH} (min).
4. To maintain a valid level, the transitioning edge of the input must:
   a. Sustain a constant slew rate from the current AC level through the target AC level, $V_{IL\ (AC)}$ or $V_{IH\ (AC)}$.
   b. Reach at least the target AC level.
   c. After the AC target level is reached, continue to maintain at least the target DC level, $V_{IL\ (DC)}$ or $V_{IH\ (DC)}$.

AC Characteristics (Read Latency = 2.5 cycle)

(Ta = 0 ~ +70°C @ R1Q*A*****BG-**R** series)

(Ta = -40 ~ +85°C @ R1Q*A*****BG-**I** series)

(V_{DD} = 1.8V ±0.1V, V_{DDQ} = 1.5V, V_{REF} = 0.75V)

Notes:

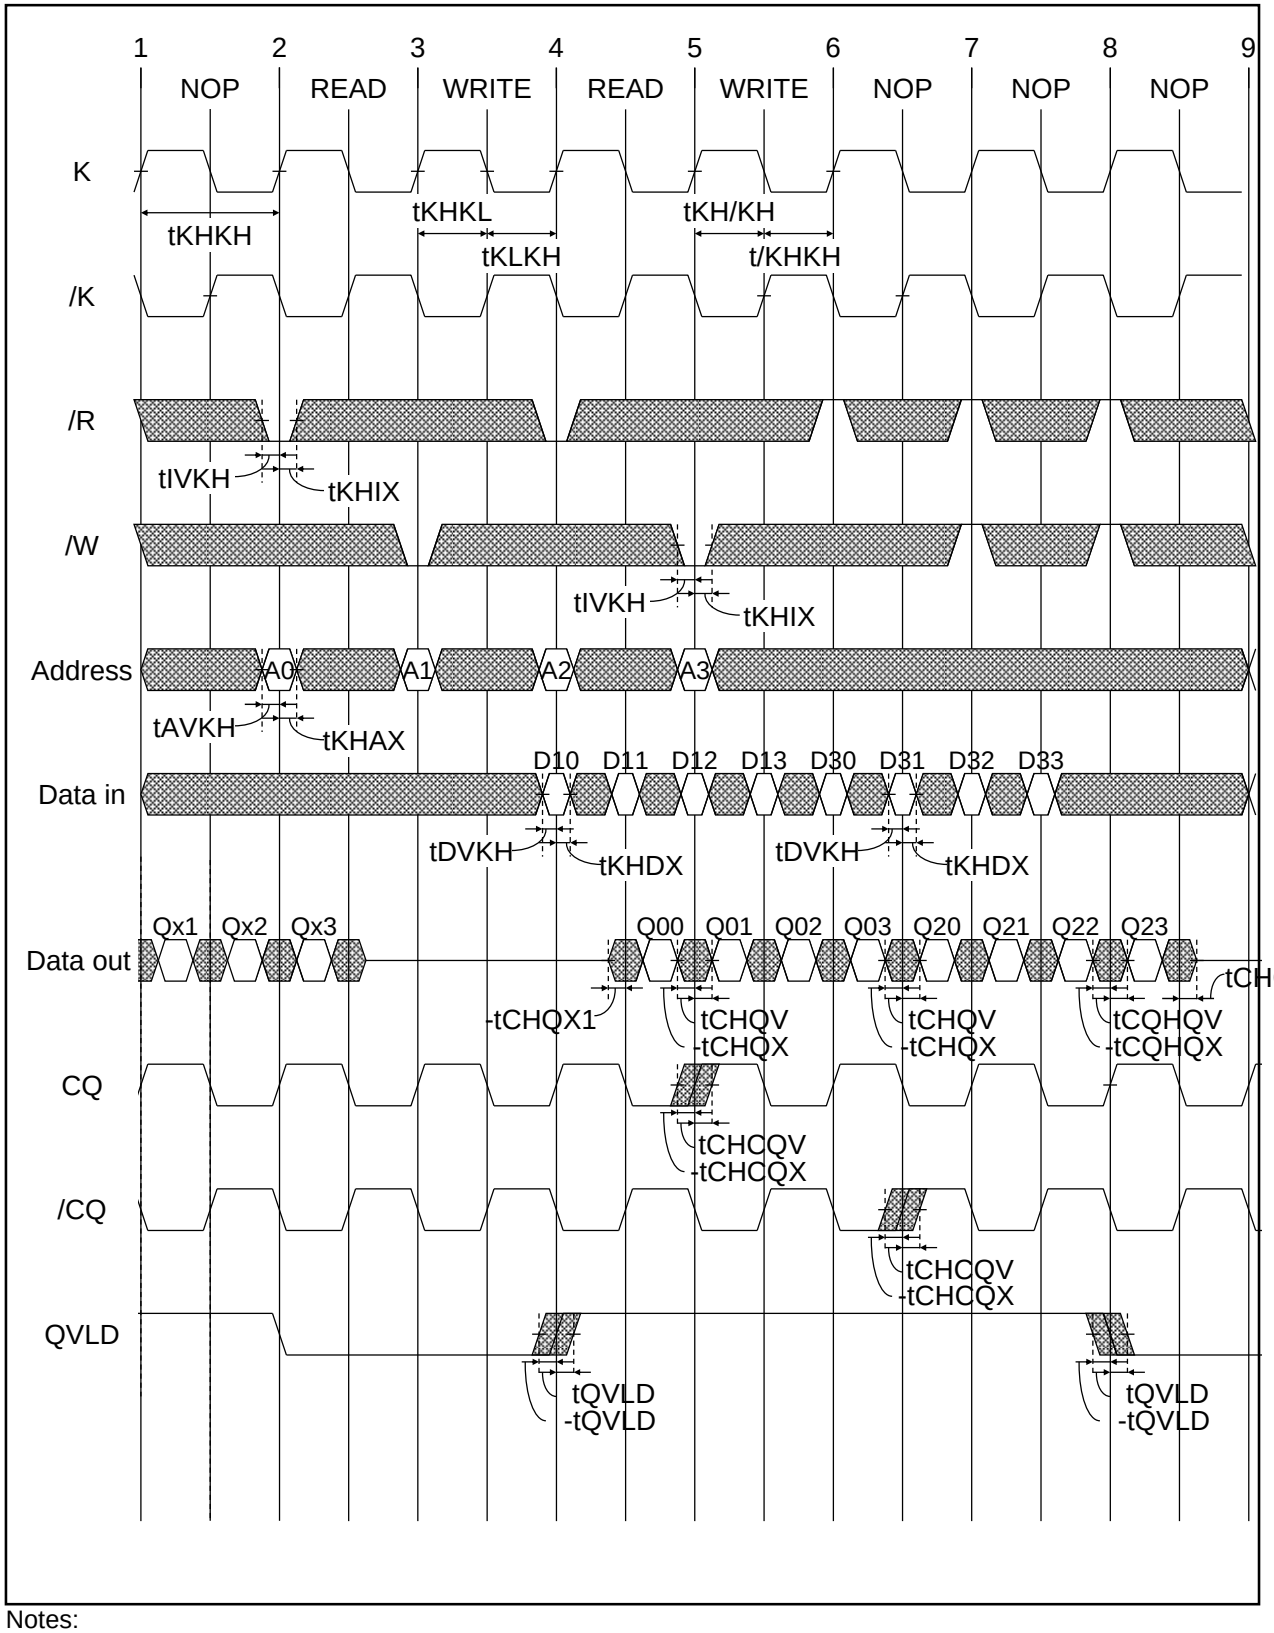
1. This is a synchronous device. All addresses, data and control lines must meet the specified setup and hold times for all latching clock edges.
2. V_{DD} slew rate must be less than 0.1 V DC per 50 ns for DLL lock retention. DLL lock time begins once V_{DD} and input clock are stable.
   It is recommended that the device is kept inactive during these cycles.
   This specification meets the QDR common spec. of 20 us.
3. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
4. Echo clock is very tightly controlled to data valid / data hold. By design, there is a ±0.1 ns variation from echo clock to data. The datasheet parameters reflect tester guardbands and test setup variations.
5. Transitions are measured ±100 mV from steady-state voltage.
6. At any given voltage and temperature t_{CHQZ} is less than t_{CHQX1} and t_{CHQV}.
7. These parameters are sampled.
8. t_{AVKH}, t_{IVKH}, t_{KHAX}, t_{KHIX} spec is determined by the actual frequency regardless of Part Number (Marking Name). The following is the spec for the actual frequency.
   0.30 ns for ≤533MHz & >500MHz
   0.33 ns for ≤500MHz & >450MHz
   0.40 ns for ≤450MHz & ≥250MHz
9. t_{DVKH}, t_{KHDX} spec is determined by the actual frequency regardless of Part Number (Marking Name). The following is the spec for the actual frequency.
   0.20 ns for ≤533MHz & >500MHz
   0.22 ns for ≤500MHz & >450MHz
   0.25 ns for ≤450MHz & >400MHz
   0.28 ns for ≤400MHz & >300MHz
   0.30 ns for ≤300MHz & ≥250MHz

Remarks:

1. Test conditions as specified with the output loading as shown in AC Test Conditions unless otherwise noted.
2. Control input signals may not be operated with pulse widths less than t_{KHKL} (min).
3. V_{DDQ} is +1.5 V DC. V_{REF} is +0.75 V DC.
4. Control signals are /R, /W (QDR series), /LD, R-/W (DDR series), /BW, /BW0, /BW1, /BW2 and /BW3. Setup and hold times of /BWx signals must be the same as those of Data-in signals.

Timing Waveforms

Read and Write Timing (QDRII+, B4, Read Latency = 2.5 cycle)



Notes:

1. Q00 refers to output from address A0+0. Q01 refers to output from the next internal burst address following A0, i.e., A0+1.
2. Outputs are disabled (high-Z) N clock cycle after the last read cycle. Here, N = Read Latency + Burst Length × 0.5.
3. In this example, if address A2 = A1, then data Q20 = D10, Q21 = D11. Write data is forwarded immediately as read results.
4. To control read and write operations, /BW signals must operate at the same timing as Data-in signals.

JTAG Specification

These products support a limited set of JTAG functions as in IEEE standard 1149.1.

Disabling the Test Access Port

It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfering with normal operation of the device, TCK must be tied to V_{SS} to preclude mid level inputs.
TDI and TMS are internally pulled up and may be unconnected, or may be connected to VDD through a pull up resistor.
TDO should be left unconnected.

Test Access Port (TAP) Pins

Symbol I/O	Pin assignments	Description	Notes
TCK	2R	Test clock input. All inputs are captured on the rising edge of TCK and all outputs propagate from the falling edge of TCK.	
TMS	10R	Test mode select. This is the command input for the TAP controller state machine.	
TDI	11R	Test data input. This is the input side of the serial registers placed between TDI and TDO. The register placed between TDI and TDO is determined by the state of the TAP controller state machine and the instruction that is currently loaded in the TAP instruction.	
TDO	1R	Test data output. Output changes in response to the falling edge of TCK. This is the output side of the serial registers placed between TDI and TDO.	

Notes:

The device does not have TRST (TAP reset). The Test-Logic Reset state is entered while TMS is held high for five rising edges of TCK. The TAP controller state is also reset on SRAM POWER-UP.

TAP DC Operating Characteristics

(Ta = 0 ~ +70°C @ R1Q*A*****BG-**R** series)

(Ta = -40 ~ +85°C @ R1Q*A*****BG-**I** series)

(V_{DD} = 1.8V ±0.1V)

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Input high voltage	V_{IH}	+1.3	—	V_{DD} + 0.3	V	
Input low voltage	V_{IL}	–0.3	—	+0.5	V	
Input leakage current	I_{LI}	–5.0	—	+5.0	µA	0 V ≤ V_{IN} ≤ V_{DD}
Output leakage current	I_{LO}	–5.0	—	+5.0	µA	0 V ≤ V_{IN} ≤ V_{DD}, output disabled
Output low voltage	V_{OL1}	—	—	0.2	V	I_{OLC} = 100 µA
	V_{OL2}	—	—	0.4	V	I_{OLT} = 2 mA
Output high voltage	V_{OH1}	1.6	—	—	V	$\|I_{OHC}\|$ = 100 µA
	V_{OH2}	1.4	—	—	V	$\|I_{OHT}\|$ = 2 mA

Notes:

1. All voltages referenced to V_{SS} (GND).
2. At power-up, V_{DD} and V_{DDQ} are assumed to be a linear ramp from 0V to V_{DD}(min.) or V_{DDQ}(min.) within 200ms. During this time V_{DDQ} < V_{DD} and V_{IH} < V_{DDQ}.
   During normal operation, V_{DDQ} must not exceed V_{DD}.

TAP AC Test Conditions

Parameter	Symbol	Conditions	Unit	Notes
Input timing measurement reference levels	V_{REF}	0.9	V	
Input pulse levels	V_{IL}, V_{IH}	0 to 1.8	V	
Input rise/fall time	tr, tf	≤ 1.0	ns	
Output timing measurement reference levels		0.9	V	
Test load termination supply voltage (V_{TT})		0.9	V	
Output load		See figures

TAP AC Operating Characteristics

(Ta = 0 ~ +70°C @ R1Q*A*****BG-**R** series)

(Ta = -40 ~ +85°C @ R1Q*A*****BG-**I** series)

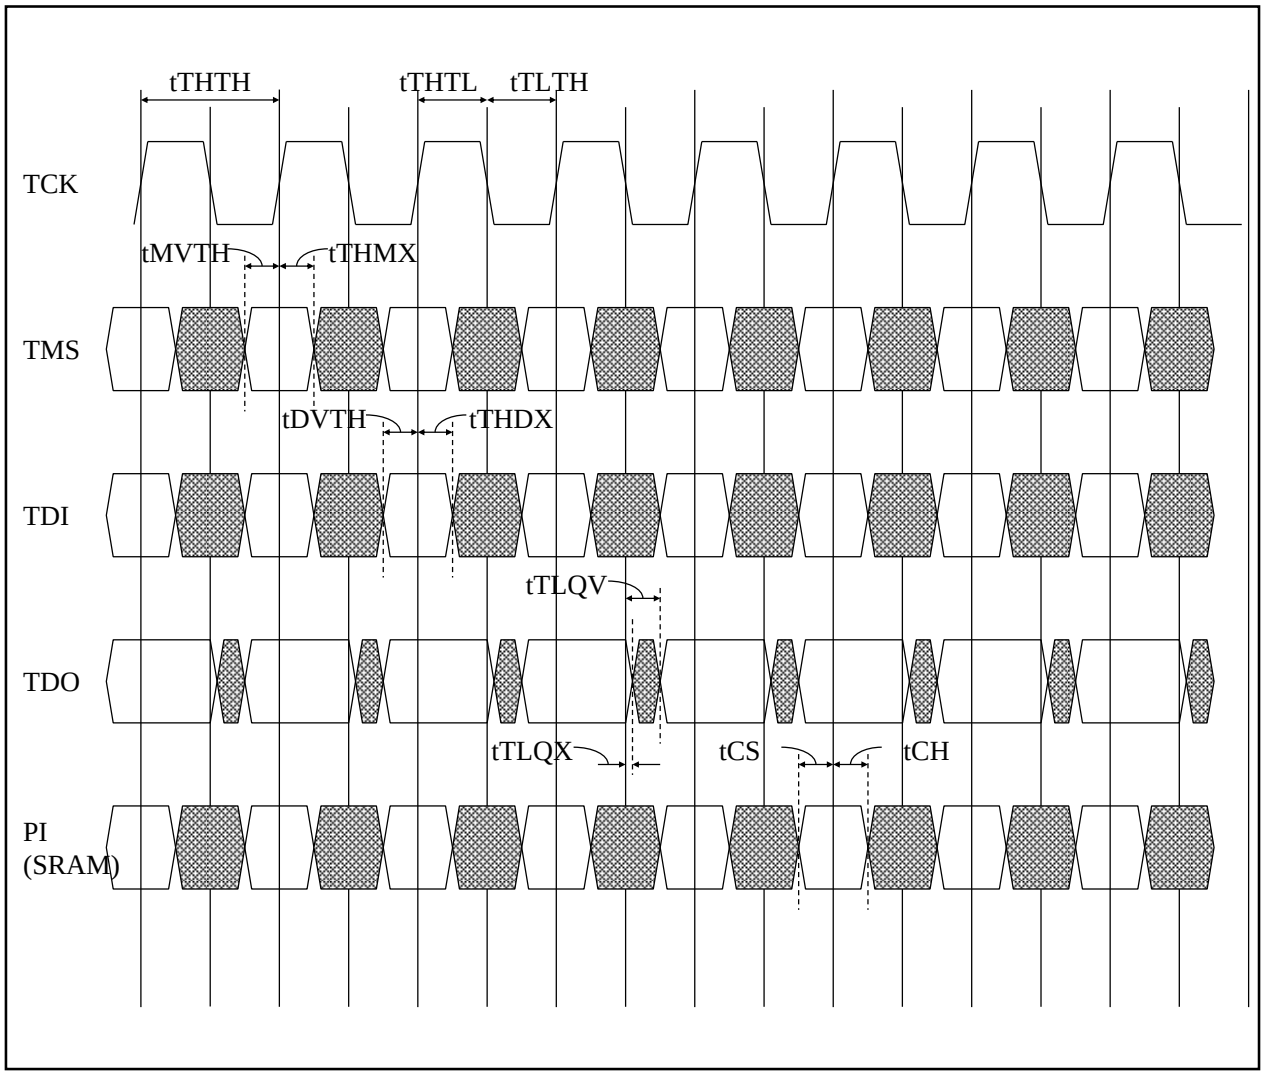
(V_{DD} = 1.8V ±0.1V)

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Test clock (TCK) cycle time	t_{THTH}	50	—	—	ns	
TCK high pulse width	t_{THTL}	20	—	—	ns	
TCK low pulse width	t_{TLTH}	20	—	—	ns	
Test mode select (TMS) setup	t_{MVTH}	5	—	—	ns	
TMS hold	t_{THMX}	5	—	—	ns	
Capture setup	t_{CS}	5	—	—	ns	1
Capture hold	t_{CH}	5	—	—	ns	1
TDI valid to TCK high	t_{DVTH}	5	—	—	ns	
TCK high to TDI invalid	t_{THDX}	5	—	—	ns	
TCK low to TDO unknown	t_{TLQX}	0	—	—	ns	
TCK low to TDO valid	t_{TLQV}	—	—	10	ns	

Notes:

1. t_{CS} + t_{CH} defines the minimum pause in RAM I/O pad transitions to assure pad data capture.

TAP Controller Timing Diagram



Test Access Port Registers

Register name	Length	Symbol	Notes
Instruction register	3 bits	IR [2:0]	
Bypass register	1 bit	BP	
ID register	32 bits	ID [31:0]	
Boundary scan register	109 bits	BS [109:1]	

TAP Controller Instruction Set

IR2	IR1	IR0	Instruction	Description	Notes
0	0	0	EXTEST	The EXTEST instruction allows circuitry external to the component package to be tested. Boundary scan register cells at output balls are used to apply test vectors, while those at input balls capture test results. Typically, the first test vector to be applied using the EXTEST instruction will be shifted into the boundary scan register using the PRELOAD instruction. Thus, during the Update-IR state of EXTEST, the output driver is turned on and the PRELOAD data is driven onto the output balls.	1, 2, 3, 5
0	0	1	IDCODE	The IDCODE instruction causes the ID ROM to be loaded into the ID register when the controller is in capture-DR mode and places the ID register between the TDI and TDO balls in shift-DR mode. The IDCODE instruction is the default instruction loaded in at power up and any time the controller is placed in the Test-Logic-Reset state.	
0	1	0	SAMPLE-Z	If the SAMPLE-Z instruction is loaded in the instruction register, all RAM outputs are forced to an inactive drive state (high-Z), moving the TAP controller into the capture-DR state loads the data in the RAMs input into the boundary scan register, and the boundary scan register is connected between TDI and TDO when the TAP controller is moved to the shift-DR state.	3, 4, 5
0	1	1	RESERVED	The RESERVED instructions are not implemented but are reserved for future use. Do not use these instructions.	
1	0	0	SAMPLE (/PRELOAD)	When the SAMPLE instruction is loaded in the instruction register, moving the TAP controller into the capture-DR state loads the data in the RAMs input and I/O buffers into the boundary scan register. Because the RAM clock(s) are independent from the TAP clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while the input buffers are in transition (i.e., in a metastable state). Although allowing the TAP to SAMPLE metastable input will not harm the device, repeatable results cannot be expected. Moving the controller to shift-DR state then places the boundary scan register between the TDI and TDO balls.	3, 5
1	0	1	RESERVED	-	
1	1	0	RESERVED	-	
1	1	1	BYPASS	The BYPASS instruction is loaded in the instruction register when the bypass register is placed between TDI and TDO. This occurs when the TAP controller is moved to the shift-DR state. This allows the board level scan path to be shortened to facilitate testing of other devices in the scan path.	

Notes:

1. Data in output register is not guaranteed if EXTEST instruction is loaded.
2. After performing EXTEST, power-up conditions are required in order to return part to normal operation.
3. RAM input signals must be stabilized for long enough to meet the TAPs input data capture setup plus hold time (t_{CS} plus t_{CH}). The RAMs clock inputs need not be paused for any other TAP operation except capturing the I/O ring contents into the boundary scan register.
4. Clock recovery initialization cycles are required after boundary scan.
5. For R1QD, R1QE, R1QF, R1QK, R1QL, R1QM, R1QP series, ODT is disabled in EXTEST, SAMPLE-Z or SAMPLE mode.

Notes:

In boundary scan mode,

1. Clock balls (K, /K, C, /C) are referenced to each other and must be at opposite logic levels for reliable operation.
2. CQ and /CQ data are synchronized to the respective C and /C (except EXTEST, SAMPLE-Z).
3. If C and /C tied high, CQ is generated with respect to K and /CQ is generated with respect to /K (except EXTEST, SAMPLE-Z).

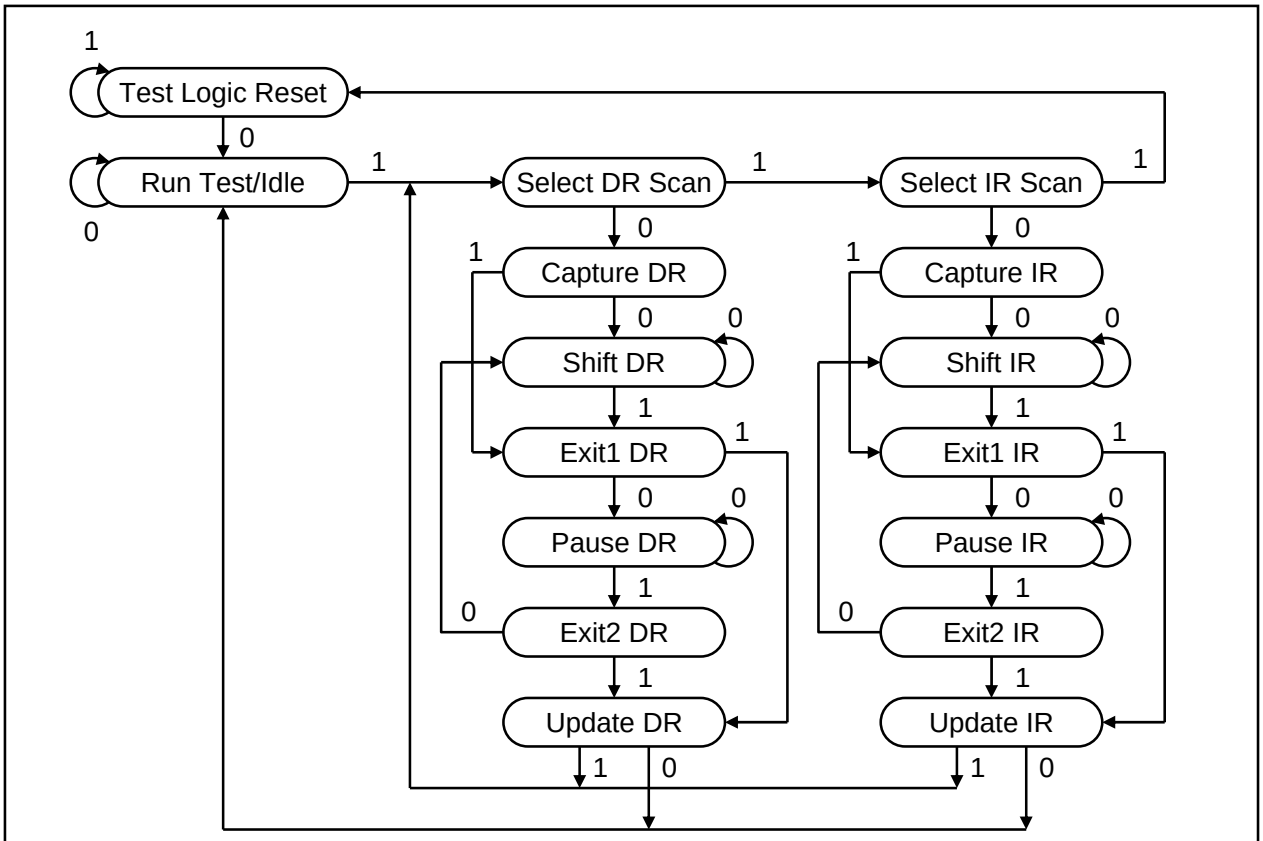
TAP Controller State Diagram



Notes:

The value adjacent to each state transition in this figure represents the signal present at TMS at the time of a rising edge at TCK.

No matter what the original state of the controller, it will enter Test-Logic-Reset when TMS is held high for at least five rising edges of TCK.

Package Dimensions and Marking Information

Both Pb parts and Pb-free parts are available.

JEITA Package Code	Renesas Code	Previous Code	Mass (typ.)
P-LBGA165-15x17-1.00	PLBG0165FD-A	165FHE	0.6 g

Revision History (1)

Rev.	Date	#	Comment
Rev. 0.00a	'08.10.08	1	Initial issue.
Rev. 0.00b	'08.10.09	1	Corrected typos in "DC Characteristics": VOH/VOL= VDDQ/2±1.12 → ±0.12.
Rev. 0.00c	'08.11.19	1	Added "Speed Bin Table". Added "ODT timing chart" to QDRII+ and DDRII+ series.
Rev. 0.00d	'08.11.28	1	Corrected typos in "General Description": ODT pin = Q0～Qn → D0～Dn.
		2	Updated "Recommended DC Operating Conditions": Vref =0.68～0.95V → 0.7～0.8V (II+ series).
		3	Added comment to "Thermal Resistance" section: These are reference values.
Rev. 0.00e	'08.12.07	1	Added "Generation Number Table".
Rev. 0.00 f -1	'09.02.09	1	Changed Marking Name in "Part Number Definition Table".
		2	Added marking information to "Package Dimension Information" section.
		3	Corrected ODT On/Off timing in "ODT pin" table.
		4	Updated minimum frequency of QDRII+ and DDRII+ series.
		5	Changed pin name in "Pin Arrangement" of DDRII+ series: SA0/SA1 → NC.
		6	Added the row to "K Truth Table": RL=2.0 and RL=2.5.
Rev. 0.00g -1	'09.02.24	1	Updated SET-UP cycles: II+ series DLL lock time = 20us → 2048 cycle.
		2	Added comment to "ODT on/off Timing Chart" section: ODT on/off switching timings are edge aligned with CQ or /CQ.
		3	Updated "Thermal Resistance".
Rev. 0.00h	'09.03.04	1	Added "-50" speed bin to QDR II B2 x18/x36 series.
Rev. 0.00i	'09.06.15	1	Updated "Package Dimensions": Mass=0.7→0.6g, A(max)=1.46→1.4mm.
		2	Updated "Operating/Standby Supply Currents".
Rev. 0.01a	'09.10.25	1	Added comment to "Power-up and Initialization Sequence" section: Apply Vref after Vddq or at the same time as Vddq.
		2	Updated "Speed Bin Table".
Rev. 0.02a	'10.02.01	1	Added "Renesas QDR SRAM Homepage URL" to notes of front page.
		2	Updated "Power-up and Initialization Sequence".
		3	Updated "DLL Constraints".
		4	Updated "Operating Supply Current" and "Standby Supply Current"
		5	Updated "Thermal Resistance".
		6	Changed remarks of "AC Characteristics" on "Control signals".
Rev. 0.03a	'10.04.01	1	Changed company name, RENESAS logo and base color from those of Renesas Technology to Renesas Electronics.
		2	Changed vender name marking in "Package Dimensions and Marking Information" section.
		3	Added "A" generation to 72M series.
Rev. 0.04a	'10.06.10	1	Changed the pin description for NC pin.
		2	Changed note 4 of "TAP Controller Instruction Set": "Clock recovery initialization cycles are required after boundary scan"
Rev. 0.05a	'10.06.25	1	Changed Vddq range of II+ series: Vddq=1.5±0.1V → 1.4V ～ Vdd.
		2	Added Note.8 and Note.9 to AC Characteristics table for II+ series.
		3	Updated Speed Bin Table for 144M.
Rev. 0.05b	'10.07.02	1	Added Note.2 to Generation Number Table.
		2	Updated Speed Bin Table for 36M and 72M.
Rev. 0.05c	'10.07.24	1	Updated Operating Supply Current and Standby Supply Current Table for 36M and 72M.
Rev. 0.06a	'10.09.20	1	Changed Initialization Sequence: Initial cycle of II+ series = 2048cycles → 20us.
Rev. 0.07a	'10.10.06	1	Added Note.9 to AC Characteristics table for II series.
Rev. 0.07b	'10.10.30	1	Updated AC Characteristics for the series of RL=2.0.
		2	Updated Speed Bin Table for 72M/36M/144M.
		3	Added R1QNA, R1QPA series to 144M QDR lineup.
		4	Changed JTAG/ID Register(ID Code): #27="0": 36M&72M w/o ODT, 144M, 288M "1": 36M&72M w/ ODT #23="0": 144M&288M w/o ODT, 36M, 72M "1": 144M&288M w/ ODT #(26, 25, 24)="100"→"101"(144M), "101"→"110"(288M).

Revision History (2)

Rev.	Date	#	Comment
Rev. 0. 08a	'11. 05. 23	1	Added Note. 7 to tQVLD in AC Characteristics table for II+ series.
		2	Changed description of tQVLD in AC Characteristics table for RL=2 series: CQ high to QVLD valid → /CQ high to QVLD valid.
		3	Updated Remarks 4 of AC Characteristics table.
		4	Updated tKHKH(max) in AC Characteristics table for QDRII+ B2 series.
		5	Added 13 x15 mm package lineup to 36M II+ & 72M II/II+ series.
		6	Copyright: (c)2010 → (c)2011

Renesas Electronics Corporation

Headquarters: Nippon Bldg., 2-6-2, Ote-machi, Chiyoda-ku, Tokyo 100-0004, Japan

NOTES:

1. This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
2. Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however,is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website. (http://www.renesas.com)
5. Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guaranties regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
7. The products described in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). The products are not designed, manufactured, tested or warranted for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. Unintended usage of the products shall be made at the customer's own risk. Renesas shall have no liability for damages arising out of the uses set forth above.
8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
   (1) artificial life support devices or systems
   (2) surgical implantations
   (3) healthcare intervention (e.g., excision, administration of medication, etc.)
   (4) any other purposes that pose a direct threat to human life
   Renesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Electronics Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.
