## Overview

The V320USC Universal System Controller simplifies the design of systems based on MIPS and SuperH microprocessors by replacing many lower integration support components with a single, high-integration device. This saves design time, board area, and manufacturing cost.

The I2O Ready V320USC is a high performance PCI bridge with integrated SDRAM controller for MIPS processors operating at up to 75 MHz bus speed. It features address translation capabilities and large on-chip buffers. A separate peripheral bus provides low latency access to SDRAM. The peripheral controller on the V320USC also performs address decoding and chip-select strobes generation for SRAM, PROM and other slow peripherals.

The integrated SDRAM Controller connects the processor as well as the PCI bus through on-chip FIFOs to SDRAM arrays of up to 1 GB in size. The fully programmable SDRAM controller also supports the use of Enhanced SDRAM to achieve even greater performance. Burst accesses of up to 1 KB from PCI and 32 bytes from the MIPS processor are supported.

The two general purpose 32-bit timers can be individually configured as a pulse width modulator, or used in other modes such as retriggerable or one-shot. The bus watch timer (MIPS mode) prevents system hangs during accesses to undecoded regions. Interrupts for a real-time operating system can be easily generated by the system heartbeat timer. A watchdog timer is also provided for graceful recovery from catastrophic program failures. Interrupt requests for all on-chip peripherals are managed by the Interrupt Control Unit. Additionally, off-chip interrupts can be routed to the Interrupt Control Unit.

The V320USC is packaged in a low-cost 208-pin EIA Plastic Quad Flat Pack (PQFP), and is available in 75 MHz speed grade (MIPS mode), 66 MHz (SH mode).

This document contains the product codes, electrical specifications, pinout, and package mechanical information for the V320USC. Detailed functional information is contained in the *V320USC User's Manual*.
