

## 18-Mbit (512 K × 36/1 M × 18) Flow Through SRAM

### Features

- Supports 133 MHz bus operations
- 512 K × 36 and 1 M × 18 common I/O
- 3.3 V core power supply ( $V_{DD}$ )
- 2.5 V or 3.3 V I/O supply ( $V_{DDQ}$ )
- Fast clock-to-output time
  - 6.5 ns (133 MHz version)
- Provides high performance 2-1-1 access rate
- User selectable burst counter supporting Intel Pentium interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self-timed write
- Asynchronous output enable
- CY7C1381D/CY7C1383D available in JEDEC-standard Pb-free 100-pin TQFP, Pb-free and non Pb-free 165-ball FBGA package. CY7C1381F/CY7C1383F available in Pb-free and non Pb-free 119-ball BGA package
- IEEE 1149.1 JTAG-Compatible Boundary Scan
- ZZ sleep mode option

### Functional Description

The CY7C1381D/CY7C1381F/CY7C1383D/CY7C1383F is a 3.3 V, 512 K × 36 and 1 M × 18 synchronous flow through SRAMs, designed to interface with high speed microprocessors with minimum glue logic<sup>[1]</sup>. Maximum access delay from clock rise is 6.5 ns (133 MHz version). A 2-bit on-chip counter captures the first address in a burst and increments the address automatically for the rest of the burst access. All synchronous inputs are gated by registers controlled by a positive edge triggered clock input (CLK). The synchronous inputs include all addresses, all data inputs, address pipelining chip enable ( $CE_1$ ), depth-expansion chip enables ( $CE_2$  and  $CE_3$ <sup>[2]</sup>), burst control inputs (ADSC, ADSP, and ADV), write enables ( $BW_x$ , and  $BWE$ ), and global write (GW). Asynchronous inputs include the output enable (OE) and the ZZ pin.

The CY7C1381D/CY7C1381F/CY7C1383D/CY7C1383F allows interleaved or linear burst sequences, selected by the MODE input pin. A HIGH selects an interleaved burst sequence, while a LOW selects a linear burst sequence. Burst accesses can be initiated with the processor address strobe (ADSP) or the cache controller address strobe (ADSC) inputs. Address advancement is controlled by the address advancement (ADV) input.

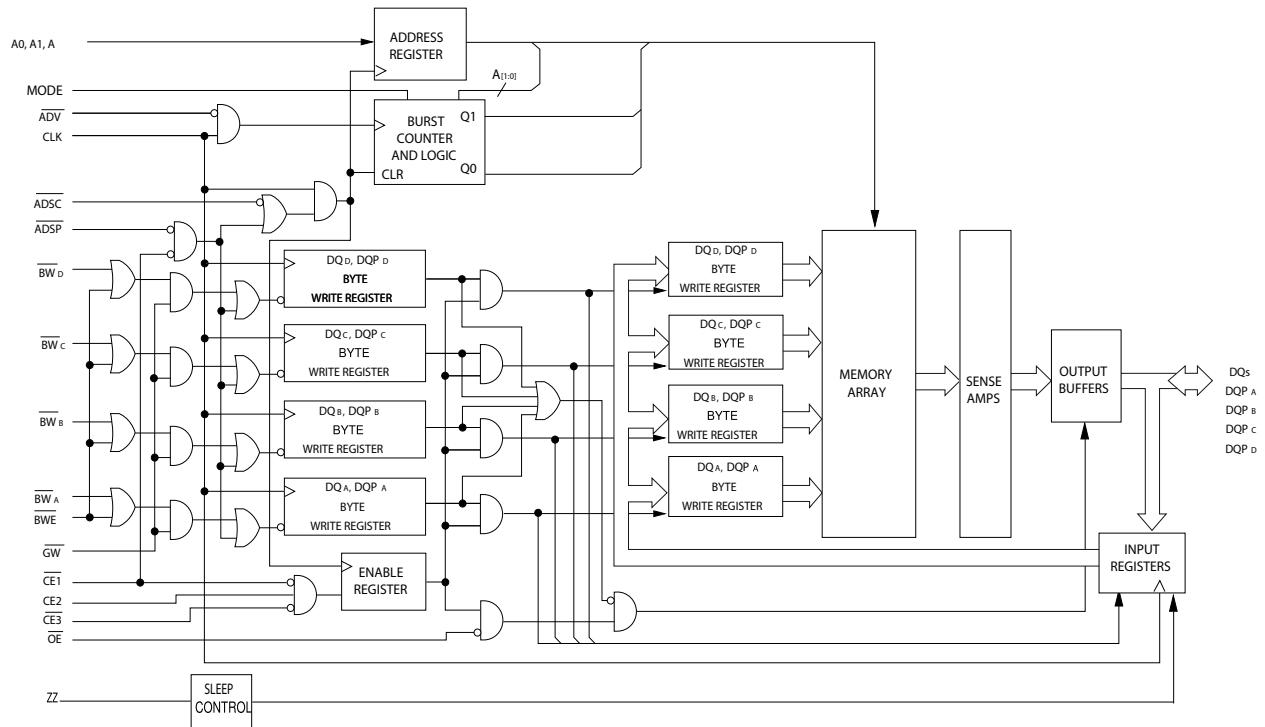

Addresses and chip enables are registered at rising edge of clock when address strobe processor (ADSP) or address strobe controller (ADSC) are active. Subsequent burst addresses can be internally generated as controlled by the advance pin (ADV).

CY7C1381D/CY7C1381F/CY7C1383D/CY7C1383F operates from a +3.3 V core power supply while all outputs operate with a +2.5 V or +3.3 V supply. All inputs and outputs are JEDEC-standard and JESD8-5-compatible.

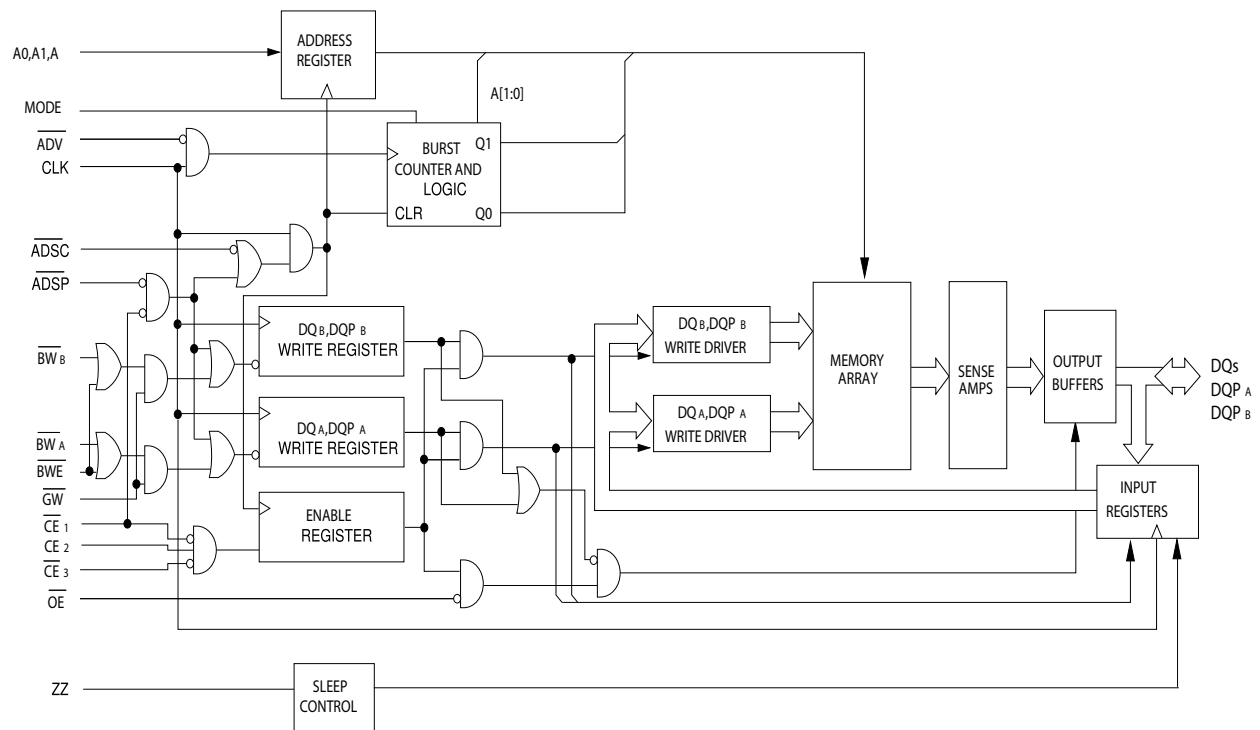

#### Notes

1. For best practices or recommendations, refer to the Cypress application note AN1064, *SRAM System Design Guidelines* on [www.cypress.com](http://www.cypress.com).
2.  $CE_3$ ,  $CE_2$  are for 100-pin TQFP and 165-ball FBGA packages only. 119-ball BGA is offered only in 1 chip enable.

**Logic Block Diagram – CY7C1381D/CY7C1381F [3] (512 K × 36)**

**Logic Block Diagram – CY7C1383D/CY7C1383F [3] (1 M × 18)**

**Note**

3. CY7C1381F and CY7C1383F have only 1 chip enable ( $\overline{CE}_1$ ).

## Pin Definitions

Name	I/O	Description
$A_0, A_1, A$	Input Synchronous	<b>Address inputs used to select one of the address locations.</b> Sampled at the rising edge of the CLK if $\overline{ADSP}$ or $\overline{ADSC}$ is active LOW, and $\overline{CE}_1, \overline{CE}_2$ , and $\overline{CE}_3^{[4]}$ are sampled active. $A_{[1:0]}$ feed the 2-bit counter.
$\overline{BW}_A, \overline{BW}_B$ $\overline{BW}_C, \overline{BW}_D$	Input Synchronous	<b>Byte write select inputs, active LOW.</b> Qualified with $\overline{BWE}$ to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.
$\overline{GW}$	Input Synchronous	<b>Global write enable input, active LOW.</b> When asserted LOW on the rising edge of CLK, a global write is conducted (all bytes are written, regardless of the values on $\overline{BW}_{[A:D]}$ and $\overline{BWE}$ ).
CLK	Input Clock	<b>Clock input.</b> Used to capture all synchronous inputs to the device. Also used to increment the burst counter when $\overline{ADV}$ is asserted LOW, during a burst operation.
$\overline{CE}_1$	Input Synchronous	<b>Chip enable 1 input, active LOW.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_2$ and $\overline{CE}_3^{[4]}$ to select or deselect the device. $\overline{ADSP}$ is ignored if $\overline{CE}_1$ is HIGH. $\overline{CE}_1$ is sampled only when a new external address is loaded.
$\overline{CE}_2$	Input Synchronous	<b>Chip enable 2 input, active HIGH.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_3^{[4]}$ to select or deselect the device. $\overline{CE}_2$ is sampled only when a new external address is loaded.
$\overline{CE}_3^{[4]}$	Input Synchronous	<b>Chip enable 3 input, active LOW.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_2$ to select or deselect the device. $\overline{CE}_3$ is sampled only when a new external address is loaded.
$\overline{OE}$	Input Asynchronous	<b>Output enable, asynchronous input, active LOW.</b> Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. $\overline{OE}$ is masked during the first clock of a read cycle when emerging from a deselected state.
$\overline{ADV}$	Input Synchronous	<b>Advance input signal.</b> Sampled on the rising edge of CLK. When asserted, it automatically increments the address in a burst cycle.
$\overline{ADSP}$	Input Synchronous	<b>Address strobe from processor, sampled on the rising edge of CLK, active LOW.</b> When asserted LOW, addresses presented to the device are captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When $\overline{ADSP}$ and $\overline{ADSC}$ are both asserted, only $\overline{ADSP}$ is recognized. $\overline{ADSP}$ is ignored when $\overline{CE}_1$ is deasserted HIGH.
$\overline{ADSC}$	Input Synchronous	<b>Address strobe from controller, sampled on the rising edge of CLK, active LOW.</b> When asserted LOW, addresses presented to the device are captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When $\overline{ADSP}$ and $\overline{ADSC}$ are both asserted, only $\overline{ADSP}$ is recognized.
$\overline{BWE}$	Input Synchronous	<b>Byte write enable input, active LOW.</b> Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
ZZ	Input Asynchronous	<b>ZZ sleep input.</b> This active HIGH input places the device in a non time critical sleep condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull down.

### Note

4.  $\overline{CE}_3, \overline{CE}_2$  are for TQFP and 165 FBGA packages only. 119 BGA is offered only in 1 chip enable.

## Pin Definitions *(continued)*

Name	I/O	Description
DQ <sub>s</sub>	I/O Synchronous	<b>Bidirectional data I/O lines.</b> As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{OE}$ . When $\overline{OE}$ is asserted LOW, the pins behave as outputs. When HIGH, DQ <sub>s</sub> and DQP <sub>x</sub> are placed in a tristate condition. The outputs are automatically tristated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of $\overline{OE}$ .
DQP <sub>x</sub>	I/O Synchronous	<b>Bidirectional data parity I/O lines.</b> Functionally, these signals are identical to DQ <sub>s</sub> . During write sequences, DQP <sub>x</sub> is controlled by $\overline{BW}_x$ correspondingly.
MODE	Input Static	<b>Selects burst order.</b> When tied to GND selects linear burst sequence. When tied to V <sub>DD</sub> or left floating selects interleaved burst sequence. This is a strap pin and must remain static during device operation. Mode pin has an internal pull-up.
V <sub>DD</sub>	Power Supply	<b>Power supply inputs to the core of the device.</b>
V <sub>DDQ</sub>	I/O Power Supply	<b>Power supply for the I/O circuitry.</b>
V <sub>SS</sub>	Ground	<b>Ground for the core of the device.</b>
V <sub>SSQ</sub>	I/O Ground	<b>Ground for the I/O circuitry.</b>
TDO	JTAG Serial Output Synchronous	<b>Serial data-out to the JTAG circuit.</b> Delivers data on the negative edge of TCK. If the JTAG feature is not being used, this pin can be left unconnected. This pin is not available on TQFP packages.
TDI	JTAG Serial Input Synchronous	<b>Serial data-in to the JTAG circuit.</b> Sampled on the rising edge of TCK. If the JTAG feature is not being used, this pin can be left floating or connected to V <sub>DD</sub> through a pull-up resistor. This pin is not available on TQFP packages.
TMS	JTAG Serial Input Synchronous	<b>Serial data-in to the JTAG circuit.</b> Sampled on the rising edge of TCK. If the JTAG feature is not being used, this pin can be disconnected or connected to V <sub>DD</sub> . This pin is not available on TQFP packages.
TCK	JTAG Clock	<b>Clock input to the JTAG circuitry.</b> If the JTAG feature is not being used, this pin must be connected to V <sub>SS</sub> . This pin is not available on TQFP packages.
NC	–	<b>No connects.</b> Not internally connected to the die. 36M, 72M, 144M, 288M, 576M, and 1G are address expansion pins and are not internally connected to the die.
V <sub>SS</sub> /DNU	Ground/DNU	This pin can be connected to ground or can be left floating.

## Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. Maximum access delay from the clock rise ( $t_{CDV}$ ) is 6.5 ns (133 MHz device).

CY7C1381D/CY7C1381F/CY7C1383D/CY7C1383F supports secondary cache in systems using a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486 processors. The linear burst sequence is suited for processors that use a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input.

Accesses can be initiated with the processor address strobe (ADSP) or the controller address strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the byte write enable ( $\overline{BWE}$ ) and byte write select ( $\overline{BW}_x$ ) inputs. A global write enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous chip selects ( $\overline{CE}_1$ ,  $CE_2$ ,  $\overline{CE}_3$  <sup>[5]</sup>) and an asynchronous output enable ( $\overline{OE}$ ) provide for easy bank selection and output tristate control. ADSP is ignored if  $CE_1$  is HIGH.

### Single Read Accesses

A single read access is initiated when the following conditions are satisfied at clock rise: (1)  $\overline{CE}_1$ ,  $CE_2$ , and  $\overline{CE}_3$  <sup>[5]</sup> are all asserted active, and (2) ADSP or ADSC is asserted LOW (if the access is initiated by ADSC, the write inputs must be deasserted during this first cycle). The address presented to the address inputs is latched into the address register and the burst counter and/or control logic, and later presented to the memory core. If the  $\overline{OE}$  input is asserted LOW, the requested data is available at the data outputs with a maximum of  $t_{CDV}$  after clock rise. ADSP is ignored if  $CE_1$  is HIGH.

### Single Write Accesses Initiated by ADSP

This access is initiated when the following conditions are satisfied at clock rise: (1)  $\overline{CE}_1$ ,  $CE_2$ ,  $\overline{CE}_3$  <sup>[5]</sup> are all asserted active, and (2) ADSP is asserted LOW. The addresses presented are loaded into the address register and the burst inputs ( $\overline{GW}$ ,  $\overline{BWE}$ , and  $\overline{BW}_X$ ) are ignored during this first clock cycle. If the write inputs are asserted active (see [Truth Table for Read/Write on page 13](#) for appropriate states that indicate a write) on the next clock rise, the appropriate data is latched and written into the device. Byte writes are allowed. All I/O are tristated during a byte write. As this is a common I/O device, the asynchronous  $\overline{OE}$  input signal must be deasserted and the I/O must be tristated prior to the presentation of data to DQs. As a safety precaution, the data lines are tristated when a write cycle is detected, regardless of the state of  $\overline{OE}$ .

### Single Write Accesses Initiated by ADSC

This write access is initiated when the following conditions are satisfied at clock rise: (1)  $\overline{CE}_1$ ,  $CE_2$ , and  $\overline{CE}_3$  <sup>[5]</sup> are all asserted active, (2) ADSC is asserted LOW, (3) ADSP is deasserted HIGH, and (4) the write input signals ( $\overline{GW}$ ,  $\overline{BWE}$ , and  $\overline{BW}_X$ ) indicate a write access. ADSC is ignored if ADSP is active LOW.

The addresses presented are loaded into the address register and the burst counter, the control logic, or both, and delivered to the memory core. The information presented to  $DQ_{[A:D]}$  is written into the specified address location. Byte writes are allowed. All I/O are tristated when a write is detected, even a byte write. Because this is a common I/O device, the asynchronous  $\overline{OE}$  input signal must be deasserted and the I/O must be tristated prior to the presentation of data to DQs. As a safety precaution,

the data lines are tristated when a write cycle is detected, regardless of the state of  $\overline{OE}$ .

### Burst Sequences

CY7C1381D/CY7C1381F/CY7C1383D/CY7C1383F provides an on-chip two-bit wraparound burst counter inside the SRAM. The burst counter is fed by  $A_{[1:0]}$ , and can follow either a linear or interleaved burst order. The burst order is determined by the state of the MODE input. A LOW on MODE selects a linear burst sequence. A HIGH on MODE selects an interleaved burst order. Leaving MODE unconnected causes the device to default to a interleaved burst sequence.

### Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation sleep mode. Two clock cycles are required to enter into or exit from this sleep mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the sleep mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the sleep mode.  $CE_1$ ,  $CE_2$ ,  $\overline{CE}_3$  <sup>[5]</sup>, ADSP, and ADSC must remain inactive for the duration of  $t_{ZREC}$  after the ZZ input returns LOW.

**Table 1. Interleaved Burst Address Table (MODE = Floating or  $V_{DD}$ )**

First Address A1: A0	Second Address A1: A0	Third Address A1: A0	Fourth Address A1: A0
00	01	10	11
01	00	11	10
10	11	00	01
11	10	01	00

**Table 2. Linear Burst Address Table (MODE = GND)**

First Address A1: A0	Second Address A1: A0	Third Address A1: A0	Fourth Address A1: A0
00	01	10	11
01	10	11	00
10	11	00	01
11	00	01	10

#### Note

5.  $\overline{CE}_3$ ,  $CE_2$  are for TQFP and 165 FBGA packages only. 119 BGA is offered only in 1 chip enable.

## ZZ Mode Electrical Characteristics

Parameter	Description	Test Conditions	Min	Max	Unit
$I_{DDZZ}$	Sleep mode standby current	$ZZ \geq V_{DD} - 0.2 \text{ V}$	–	80	mA
$t_{ZZS}$	Device operation to ZZ	$ZZ \geq V_{DD} - 0.2 \text{ V}$	–	$2t_{CYC}$	ns
$t_{ZZREC}$	ZZ recovery time	$ZZ \leq 0.2 \text{ V}$	$2t_{CYC}$	–	ns
$t_{ZZI}$	ZZ active to sleep current	This parameter is sampled	–	$2t_{CYC}$	ns
$t_{RZZI}$	ZZ inactive to exit sleep current	This parameter is sampled	0	–	ns

## Truth Table

### Notes

6. X = Don't Care, H = Logic HIGH, L = Logic LOW.
7.  $\overline{WRITE} = L$  when any one or more byte write enable signals, and  $\overline{BWE} = L$  or  $\overline{GW} = L$ .  $\overline{WRITE} = H$  when all byte write enable signals,  $\overline{BWE}$ ,  $\overline{GW} = H$ .
8. The DQ pins are controlled by the current cycle and the  $\overline{OE}$  signal.  $\overline{OE}$  is asynchronous and is not sampled with the clock.
9. The SRAM always initiates a read cycle when  $\overline{ADSP}$  is asserted, regardless of the state of  $\overline{GW}$ ,  $\overline{BWE}$ , or  $\overline{BW}_x$ . Writes may occur only on subsequent clocks after the  $\overline{ADSP}$  or with the assertion of  $\overline{ADSC}$ . As a result,  $\overline{OE}$  must be driven HIGH prior to the start of the write cycle to allow the outputs to tristate.  $\overline{OE}$  is a don't care for the remainder of the write cycle.
10.  $\overline{OE}$  is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tristate when  $\overline{OE}$  is inactive or when the device is deselected, and all data bits behave as output when  $\overline{OE}$  is active (LOW).

## Truth Table for Read/Write

### Notes

11. X=Don't Care, H = Logic HIGH, L = Logic LOW.

12. The table only lists a partial listing of the byte write combinations. Any combination of  $\overline{BW}_X$  is valid. Appropriate write is done based on which byte write is active.

## IEEE 1149.1 Serial Boundary Scan (JTAG)

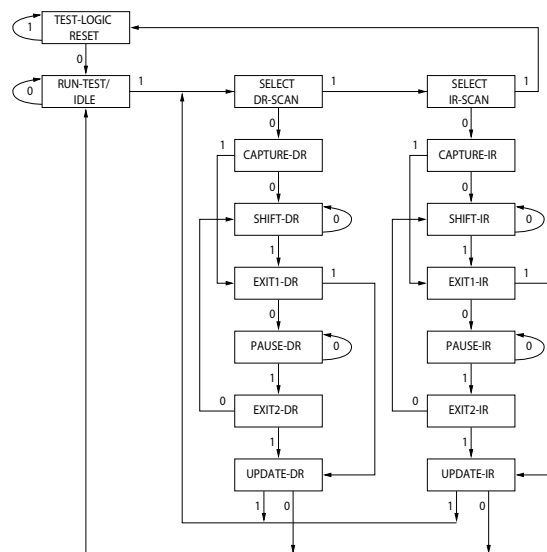

The CY7C1381D/CY7C1381F/CY7C1383D/CY7C1383F incorporates a serial boundary scan test access port (TAP). This part is fully compliant with 1149.1. The TAP operates using JEDEC-standard 3.3 V or 2.5 V I/O logic levels.

CY7C1381D/CY7C1381F/CY7C1383D/CY7C1383F contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

### Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW ( $V_{SS}$ ) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to  $V_{DD}$  through a pull-up resistor. TDO may be left unconnected. At power up, the device comes up in a reset state, which does not interfere with the operation of the device.

### TAP Controller State Diagram

The 0 or 1 next to each state represents the value of TMS at the rising edge of TCK.

### Test Access Port (TAP)

#### Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

#### Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. This pin may be left unconnected if the TAP is not used. The ball is pulled up internally, resulting in a logic HIGH level.

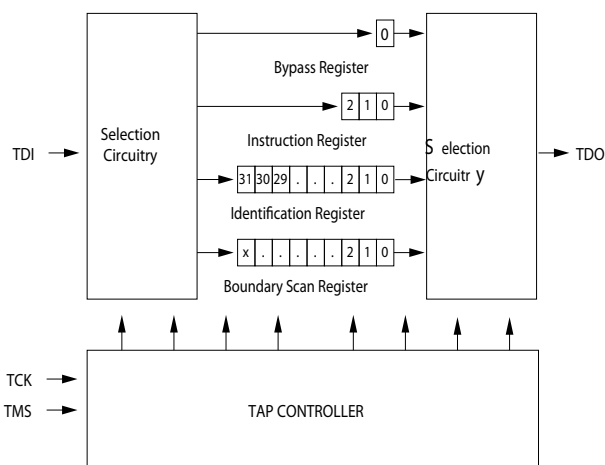

#### Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register. (See [TAP Controller Block Diagram](#).)

#### Test Data-Out (TDO)

The TDO output ball is used to serially clock data-out from the registers. The output is active depending upon the current state of the TAP state machine. The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register. (See [TAP Controller State Diagram](#).)

### TAP Controller Block Diagram

### Performing a TAP Reset

A reset is performed by forcing TMS HIGH ( $V_{DD}$ ) for five rising edges of TCK. This reset does not affect the operation of the SRAM and may be performed while the SRAM is operating. At power up, the TAP is reset internally to ensure that TDO comes up in a high Z state.

### TAP Registers

Registers are connected between the TDI and TDO balls and allow data to be scanned in and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction registers. Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

#### Instruction Register

Three-bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the [TAP Controller Block Diagram](#). Upon power up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary '01' pattern to allow for fault isolation of the board level serial test path.

#### *Bypass Register*

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single-bit register that can be placed between the TDI and TDO balls. This allows data to be shifted through the SRAM with minimal delay. The bypass register is set LOW ( $V_{SS}$ ) when the BYPASS instruction is executed.

#### *Boundary Scan Register*

The boundary scan register is connected to all the input and bidirectional balls on the SRAM.

The boundary scan register is loaded with the contents of the RAM input and output ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD, and SAMPLE Z instructions can be used to capture the contents of the input and output ring.

The boundary scan order tables show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI, and the LSB is connected to TDO.

#### *Identification (ID) Register*

The ID register is loaded with a vendor-specific 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in [Identification Register Definitions on page 18](#).

### **TAP Instruction Set**

#### *Overview*

Eight different instructions are possible with the three bit instruction register. All combinations are listed in [Identification Codes on page 18](#). Three of these instructions are listed as RESERVED and must not be used. The other five instructions are described in detail below.

Instructions are loaded into the TAP controller during the Shift-IR state, when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction when it is shifted in, the TAP controller needs to be moved into the Update-IR state.

#### *EXTEST*

The EXTEST instruction enables the preloaded data to be driven out through the system output pins. This instruction also selects the boundary scan register to be connected for serial access between the TDI and TDO in the Shift-DR controller state.

#### *IDCODE*

The IDCODE instruction causes a vendor-specific 32-bit code to be loaded into the instruction register. It also places the instruction register between the TDI and TDO balls and allows

the IDCODE to be shifted out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register upon power up or whenever the TAP controller is given a test logic reset state.

#### *SAMPLE Z*

The SAMPLE Z instruction causes the boundary scan register to be connected between the TDI and TDO balls when the TAP controller is in a Shift-DR state. The SAMPLE Z command places all SRAM outputs into a high Z state.

#### *SAMPLE/PRELOAD*

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. When the SAMPLE/PRELOAD instructions are loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and output pins is captured in the boundary scan register.

The user must be aware that the TAP controller clock can only operate at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output undergoes a transition. The TAP may then try to capture a signal while in transition (metastable state). This does not harm the device, but there is no guarantee as to the value that is captured. Repeatable results may not be possible.

To guarantee that the boundary scan register captures the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold times ( $t_{CS}$  and  $t_{CH}$ ). The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the CK and CK captured in the boundary scan register.

After the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO pins.

PRELOAD allows an initial data pattern to be placed at the latched parallel outputs of the boundary scan register cells prior to the selection of another boundary scan test operation.

The shifting of data for the SAMPLE and PRELOAD phases can occur concurrently when required; that is, while data captured is shifted out, the preloaded data is shifted in.

#### *BYPASS*

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO balls. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

#### *EXTEST Output Bus Tri-State*

IEEE standard 1149.1 mandates that the TAP controller be able to put the output bus into a tristate mode.

The boundary scan register has a special bit located at bit #85 (for 119-ball BGA package) or bit #89 (for 165-ball FBGA package). When this scan cell, called the "extest output bus tristate," is latched into the preload register during the

Update-DR state in the TAP controller, it directly controls the state of the output (Q-bus) pins, when the EXTEST is entered as the current instruction. When HIGH, it enables the output buffers to drive the output bus. When LOW, this bit places the output bus into a high Z condition.

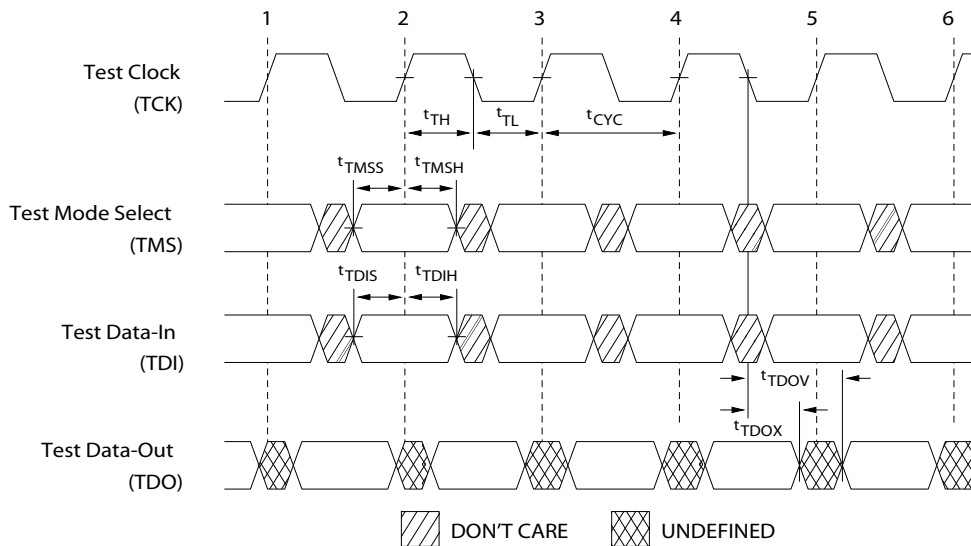

This bit can be set by entering the SAMPLE/PRELOAD or EXTEST command, and then shifting the desired bit into that cell, during the Shift-DR state. During Update-DR, the value loaded into that shift-register cell latches into the preload register. When

the EXTEST instruction is entered, this bit directly controls the output Q-bus pins. Note that this bit is preset HIGH to enable the output when the device is powered up, and also when the TAP controller is in the Test-Logic-Reset state.

#### Reserved

These instructions are not implemented but are reserved for future use. Do not use these instructions.

## TAP Timing

## TAP AC Switching Characteristics

Over the Operating Range [13, 14]

Parameter	Description	Min	Max	Unit
<b>Clock</b>				
$t_{TCYC}$	TCK Clock Cycle Time	50	—	ns
$t_{TF}$	TCK Clock Frequency	—	20	MHz
$t_{TH}$	TCK Clock HIGH Time	20	—	ns

## Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. For user guidelines, not tested.

Storage Temperature ..... -65 °C to +150 °C

Ambient Temperature with  
Power Applied ..... -55 °C to +125 °C

Supply Voltage on  $V_{DD}$  Relative to GND ..... -0.3 V to +4.6 V

Supply Voltage on  $V_{DDQ}$  Relative to GND ..... -0.3 V to + $V_{DD}$

DC Voltage Applied to Outputs

in Tri-State ..... -0.5 V to  $V_{DDQ} + 0.5$  V

DC Input Voltage ..... -0.5 V to  $V_{DD} + 0.5$  V

Current into Outputs (LOW)..... 20 mA

Static Discharge Voltage..... > 2001 V  
(per MIL-STD-883, Method 3015)

Latch-up Current..... > 200 mA

## Operating Range

Range	Ambient Temperature	$V_{DD}$	$V_{DDQ}$
Commercial	0 °C to +70 °C	3.3 V -5%/+10%	2.5 V -5% to $V_{DD}$
Industrial	-40 °C to +85 °C		

## Neutron Soft Error Immunity

Parameter	Description	Test Conditions	Typ	Max <sup>[21]</sup>	Unit
LSBU	Logical Single-Bit Upsets	25 °C	361	394	FIT/Mb
LMBU	Logical Multi-Bit Upsets	25 °C	0	0.01	FIT/Mb
SEL	Single Event Latch Up	85 °C	0	0.1	FIT/Dev

## Electrical Characteristics

Over the Operating Range <sup>[22, 23]</sup>

Parameter	Description	Test Conditions		Min	Max	Unit
V <sub>DD</sub>	Power Supply Voltage			3.135	3.6	V
V <sub>DDQ</sub>	I/O Supply Voltage	for 3.3 V I/O		3.135	V <sub>DD</sub>	V
		for 2.5 V I/O		2.375	2.625	V
V <sub>OH</sub>	Output HIGH Voltage	for 3.3 V I/O, I <sub>OH</sub> = −4.0 mA		2.4	–	V
		for 2.5 V I/O, I <sub>OH</sub> = −1.0 mA		2.0	–	V
V <sub>OL</sub>	Output LOW Voltage	for 3.3 V I/O, I <sub>OL</sub> = 8.0 mA		–	0.4	V
		for 2.5 V I/O, I <sub>OL</sub> = 1.0 mA		–	0.4	V
V <sub>IH</sub>	Input HIGH Voltage <sup>[22]</sup>	for 3.3 V I/O		2.0	V <sub>DD</sub> + 0.3 V	V
		for 2.5 V I/O		1.7	V <sub>DD</sub> + 0.3 V	V
V <sub>IL</sub>	Input LOW Voltage <sup>[22]</sup>	for 3.3 V I/O		−0.3	0.8	V
		for 2.5 V I/O		−0.3	0.7	V
I <sub>X</sub>	Input Leakage Current except ZZ and MODE	GND ≤ V <sub>I</sub> ≤ V <sub>DDQ</sub>		−5	5	μA
	Input Current of MODE	Input = V <sub>SS</sub>		−30	–	μA
		Input = V <sub>DD</sub>		–	5	μA
	Input Current of ZZ	Input = V <sub>SS</sub>		−5	–	μA
		Input = V <sub>DD</sub>		–	30	μA
I <sub>OZ</sub>	Output Leakage Current	GND ≤ V <sub>I</sub> ≤ V <sub>DD</sub> , Output Disabled		−5	5	μA
I <sub>DD</sub>	V <sub>DD</sub> Operating Supply Current	V <sub>DD</sub> = Max, I <sub>OUT</sub> = 0 mA, f = f <sub>MAX</sub> = 1/t <sub>CYC</sub>	7.5 ns cycle, 133 MHz	–	210	mA
			10 ns cycle, 100 MHz	–	175	mA

### Notes

21. No LMBU or SEL events occurred during testing; this column represents a statistical c2, 95% confidence limit calculation. For more details refer to Application Note AN54908, *Accelerated Neutron SER Testing and Calculation of Terrestrial Failure Rates*.

22. Overshoot:  $V_{IH}(AC) < V_{DD} + 1.5$  V (pulse width less than  $t_{CYC}/2$ ), undershoot:  $V_{IL}(AC) > -2$  V (pulse width less than  $t_{CYC}/2$ ).

23.  $T_{power\ up}$ : Assumes a linear ramp from 0 V to  $V_{DD}(\text{min})$  within 200 ms. During this time  $V_{IH} < V_{DD}$  and  $V_{DDQ} \leq V_{DD}$ .

## Electrical Characteristics

Over the Operating Range (continued)<sup>[22, 23]</sup>

Parameter	Description	Test Conditions		Min	Max	Unit
I <sub>SB1</sub>	Automatic CE Power Down Current—TTL Inputs	Max V <sub>DD</sub> , Device Deselected, V <sub>IN</sub> ≥ V <sub>IH</sub> or V <sub>IN</sub> ≤ V <sub>IL</sub> , f = f <sub>MAX</sub> , inputs switching	7.5 ns cycle, 133 MHz	–	140	mA
			10 ns cycle, 100 MHz	–	120	
I <sub>SB2</sub>	Automatic CE Power Down Current—CMOS Inputs	Max V <sub>DD</sub> , Device Deselected, V <sub>IN</sub> ≥ V <sub>DD</sub> – 0.3 V or V <sub>IN</sub> ≤ 0.3 V, f = 0, inputs static	All speeds	–	70	mA
I <sub>SB3</sub>	Automatic CE Power Down Current—CMOS Inputs	Max V <sub>DD</sub> , Device Deselected, V <sub>IN</sub> ≥ V <sub>DDQ</sub> – 0.3 V or V <sub>IN</sub> ≤ 0.3 V, f = f <sub>MAX</sub> , inputs switching	7.5 ns cycle, 133 MHz	–	130	mA
			10 ns cycle, 100 MHz	–	110	mA
I <sub>SB4</sub>	Automatic CE Power Down Current—TTL Inputs	Max V <sub>DD</sub> , Device Deselected, V <sub>IN</sub> ≥ V <sub>DD</sub> – 0.3 V or V <sub>IN</sub> ≤ 0.3 V, f = 0, inputs static	All Speeds	–	80	mA

## Capacitance <sup>[24]</sup>

Parameter	Description	Test Conditions	100 TQFP Package	119 BGA Package	165 FBGA Package	Unit
$C_{IN}$	Input Capacitance	$T_A = 25^\circ\text{C}$ , $f = 1$ MHz, $V_{DD} = 3.3$ V.	5	8	9	pF
$C_{CLK}$	Clock Input Capacitance	$V_{DDQ} = 2.5$ V	5	8	9	pF
$C_{IO}$	Input/Output Capacitance		5	8	9	pF

## Thermal Resistance <sup>[24]</sup>

Parameter	Description	Test Conditions	100 TQFP Package	119 BGA Package	165 FBGA Package	Unit
$\Theta_{JA}$	Thermal Resistance (Junction to Ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, in accordance with EIA/JESD51.	28.66	23.8	20.7	$^\circ\text{C/W}$
$\Theta_{JC}$	Thermal Resistance (Junction to Case)		4.08	6.2	4.0	$^\circ\text{C/W}$

### 3.3 V I/O Test Load

### 2.5 V I/O Test Load

#### Note

24. Tested initially and after any design or process change that may affect these parameters.

## Switching Characteristics

Over the Operating Range [25, 26]

Parameter	Description	133 MHz		100 MHz		Unit
		Min	Max	Min	Max	
$t_{POWER}$	$V_{DD}$ (Typical) to the First Access [27]	1	–	1	–	ms
<b>Clock</b>						
$t_{CYC}$	Clock Cycle Time	7.5	–	10	–	ns
$t_{CH}$	Clock HIGH	2.1	–	2.5	–	ns
$t_{CL}$	Clock LOW	2.1	–	2.5	–	ns
<b>Output Times</b>						
$t_{CDV}$	Data Output Valid After CLK Rise	–	6.5	–	8.5	ns
$t_{DOH}$	Data Output Hold After CLK Rise	2.0	–	2.0	–	ns
$t_{CLZ}$	Clock to low Z [28, 29, 30]	2.0	–	2.0	–	ns
$t_{CHZ}$	Clock to high Z [28, 29, 30]	0	4.0	0	5.0	ns
$t_{OEV}$	$\overline{OE}$ LOW to Output Valid	–	3.2	–	3.8	ns
$t_{OELZ}$	$\overline{OE}$ LOW to Output low Z [28, 29, 30]	0	–	0	–	ns
$t_{OEZH}$	$\overline{OE}$ HIGH to Output high Z [28, 29, 30]	–	4.0	–	5.0	ns
<b>Setup Times</b>						
$t_{AS}$	Address Setup Before CLK Rise	1.5	–	1.5	–	ns
$t_{ADS}$	$\overline{ADSP}$ , $\overline{ADSC}$ Setup Before CLK Rise	1.5	–	1.5	–	ns
$t_{ADVS}$	$\overline{ADV}$ Setup Before CLK Rise	1.5	–	1.5	–	ns
$t_{WES}$	$\overline{GW}$ , $\overline{BWE}$ , $\overline{BW}_{[A:D]}$ Setup Before CLK Rise	1.5	–	1.5	–	ns
$t_{DS}$	Data Input Setup Before CLK Rise	1.5	–	1.5	–	ns
$t_{CES}$	Chip Enable Setup	1.5	–	1.5	–	ns
<b>Hold Times</b>						
$t_{AH}$	Address Hold After CLK Rise	0.5	–	0.5	–	ns
$t_{ADH}$	$\overline{ADSP}$ , $\overline{ADSC}$ Hold After CLK Rise	0.5	–	0.5	–	ns
$t_{WEH}$	$\overline{GW}$ , $\overline{BWE}$ , $\overline{BW}_{[A:D]}$ Hold After CLK Rise	0.5	–	0.5	–	ns
$t_{ADVH}$	$\overline{ADV}$ Hold After CLK Rise	0.5	–	0.5	–	ns
$t_{DH}$	Data Input Hold After CLK Rise	0.5	–	0.5	–	ns
$t_{CEH}$	Chip Enable Hold After CLK Rise	0.5	–	0.5	–	ns

### Notes

25. Timing reference level is 1.5 V when  $V_{DDQ} = 3.3$  V and is 1.25 V when  $V_{DDQ} = 2.5$  V.

26. Test conditions shown in (a) of Figure 4 on page 22 unless otherwise noted.

27. This part has a voltage regulator internally;  $t_{POWER}$  is the time that the power needs to be supplied above  $V_{DD}$ (minimum) initially, before a read or write operation can be initiated.

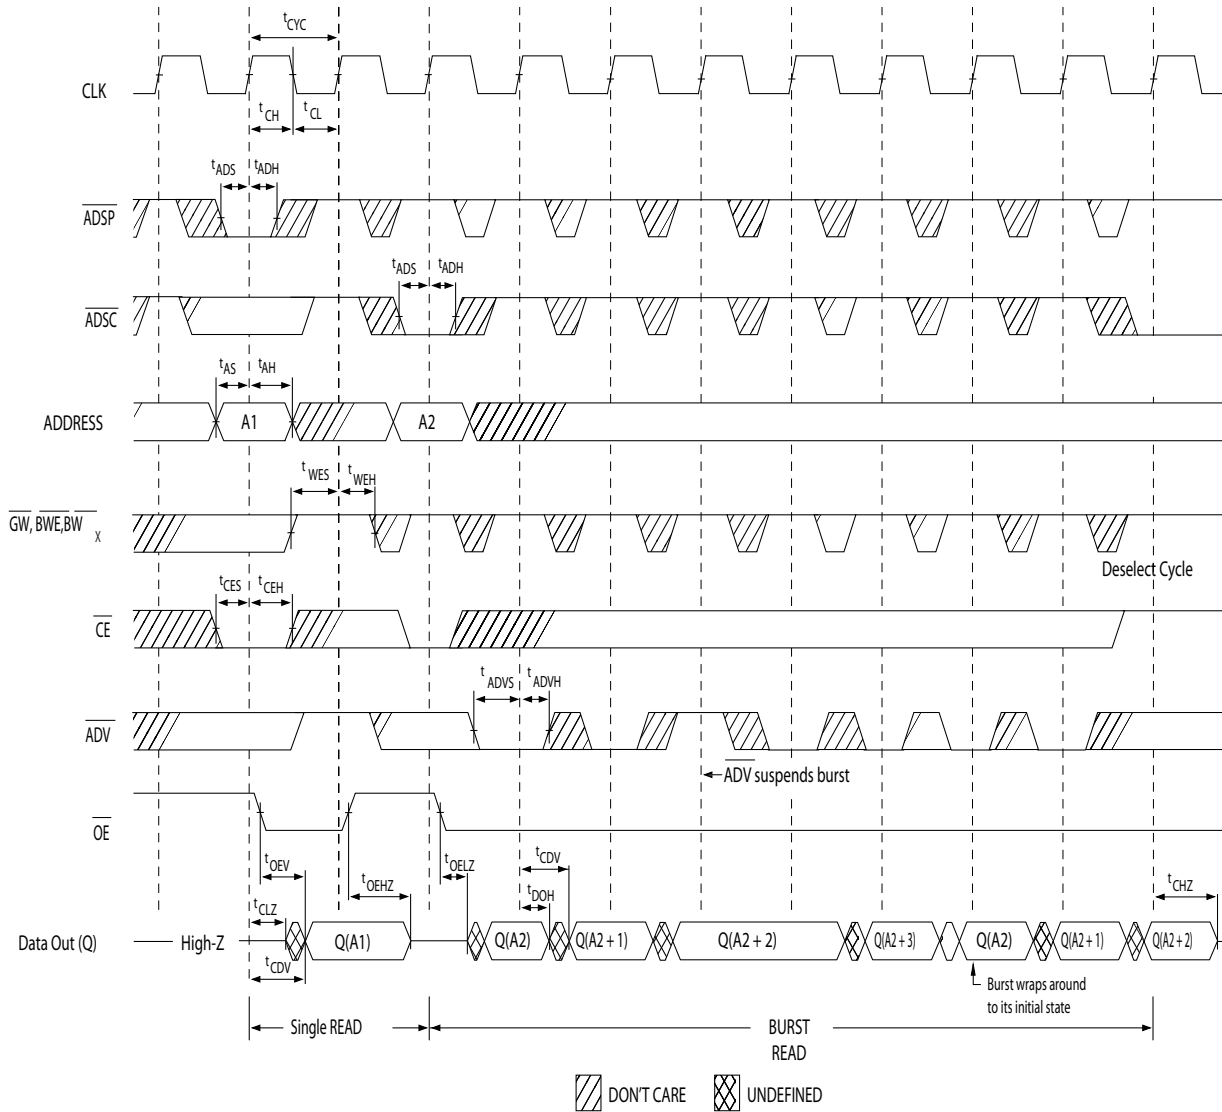

28.  $t_{CHZ}$ ,  $t_{CLZ}$ ,  $t_{OELZ}$ , and  $t_{OEZH}$  are specified with AC test conditions shown in part (b) of Figure 4 on page 22. Transition is measured  $\pm 200$  mV from steady-state voltage

29. At any given voltage and temperature,  $t_{OEZH}$  is less than  $t_{OELZ}$  and  $t_{CHZ}$  is less than  $t_{CLZ}$  to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system condition.

30. This parameter is sampled and not 100% tested.

## Timing Diagrams

**Figure 5. Read Cycle Timing** <sup>[31]</sup>

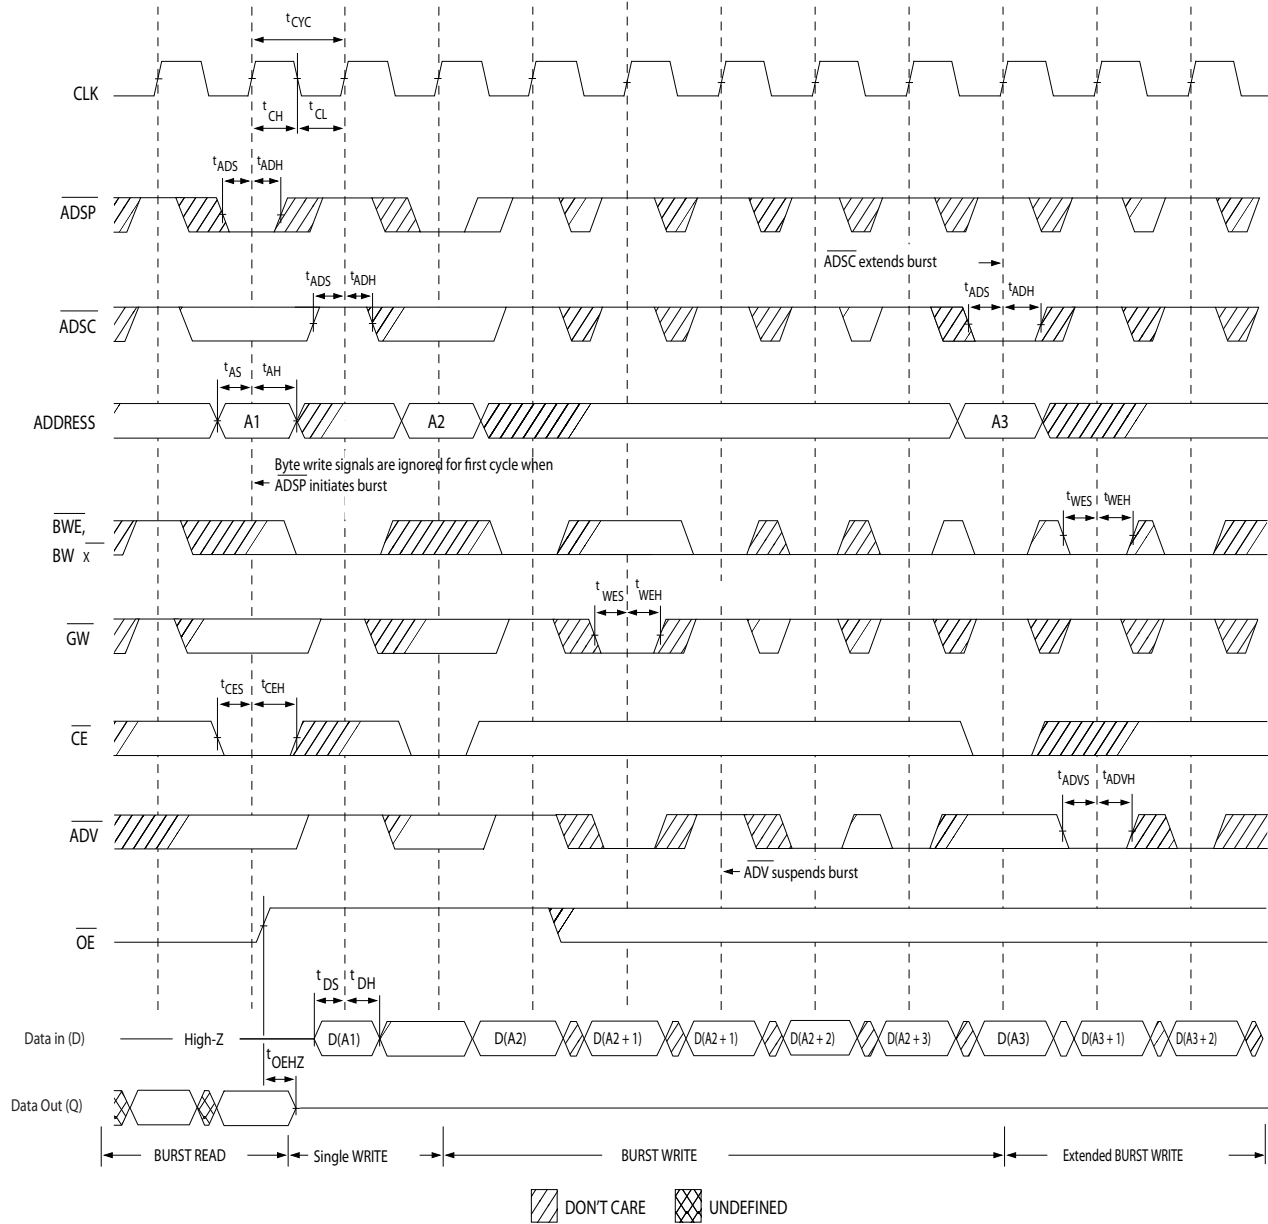

### Note

31. On this diagram, when CE is LOW: CE1 is LOW, CE2 is HIGH and CE3 is LOW. When CE is HIGH: CE1 is HIGH or CE2 is LOW or CE3 is HIGH.

## Timing Diagrams (continued)

**Figure 6. Write Cycle Timing** [32, 33]

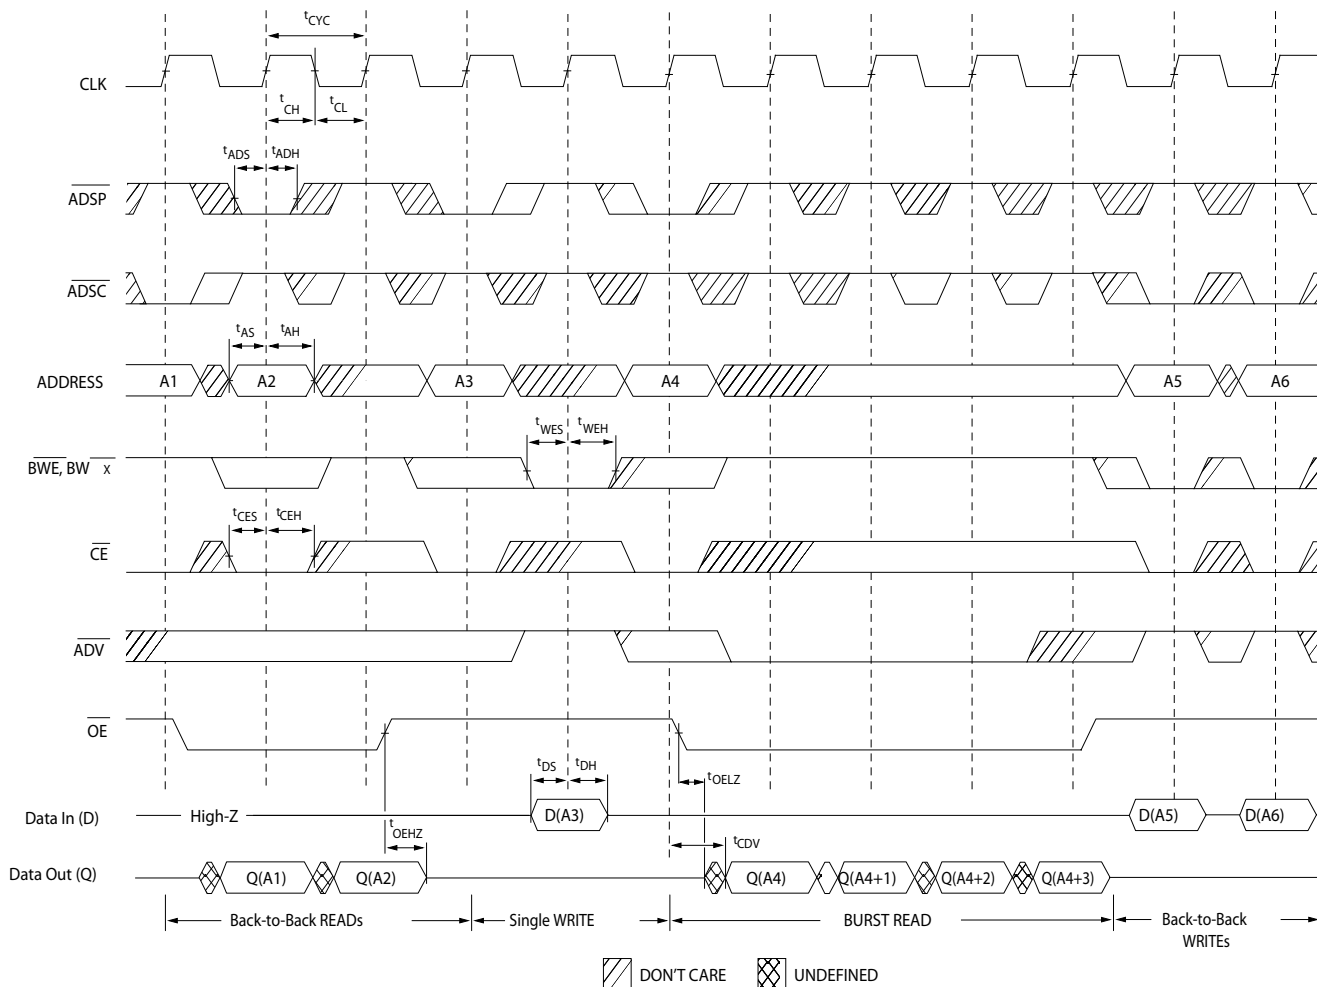

### Notes

32. On this diagram, when CE is LOW: CE1 is LOW, CE2 is HIGH and CE3 is LOW. When CE is HIGH: CE1 is HIGH or CE2 is LOW or CE3 is HIGH.  
33. Full width write can be initiated by either GW LOW; or by GW HIGH, BWE LOW and BW<sub>x</sub> LOW.

## Timing Diagrams (continued)

**Figure 7. Read/Write Cycle Timing** [34, 35, 36]

### Notes

34. On this diagram, when CE is LOW: CE1 is LOW, CE2 is HIGH and CE3 is LOW. When CE is HIGH: CE1 is HIGH or CE2 is LOW or CE3 is HIGH.

35. The data bus (Q) remains in high Z following a WRITE cycle, unless a new read access is initiated by ADSP or ADSC.

36. GW is HIGH.

## Timing Diagrams *(continued)*

**Figure 8. ZZ Mode Timing** [37, 38]

### Notes

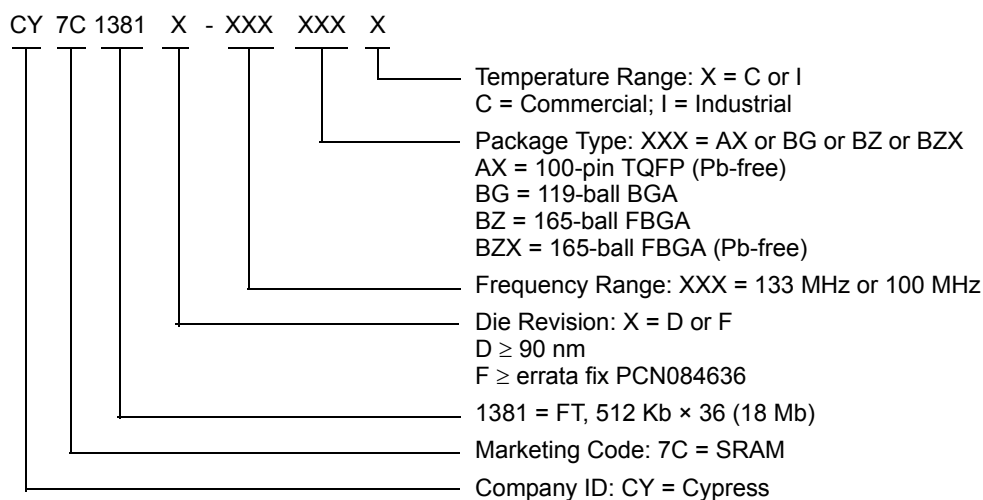

37. Device must be deselected when entering ZZ mode. See "Truth Table" on page 12 for all possible signal conditions to deselect the device.  
38. DQs are in high Z when exiting ZZ sleep mode.

## Ordering Information

Cypress offers other versions of this type of product in many different configurations and features. The below table contains only the list of parts that are currently available. For a complete listing of all options, visit the Cypress website at [www.cypress.com](http://www.cypress.com) and refer to the product summary page at <http://www.cypress.com/products> or contact your local sales representative. Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at <http://www.cypress.com/go/datasheet/offices>.

Speed (MHz)	Ordering Code	Package Diagram	Part and Package Type	Operating Range
133	CY7C1381D-133AXC	51-85050	100-pin Thin Quad Flat Pack (14 × 20 × 1.4 mm) Pb-free	Commercial
	CY7C1381F-133BGC	51-85115	119-ball Ball Grid Array (14 × 22 × 2.4 mm)	
	CY7C1381D-133AXI	51-85050	100-pin Thin Quad Flat Pack (14 × 20 × 1.4 mm) Pb-free	Industrial
100	CY7C1381D-100AXC	51-85050	100-pin Thin Quad Flat Pack (14 × 20 × 1.4 mm) Pb-free	Commercial
	CY7C1381D-100BZI	51-85180	165-ball Fine-Pitch Ball Grid Array (13 × 15 × 1.4 mm)	Industrial
	CY7C1381D-100BZXI		165-ball Fine-Pitch Ball Grid Array (13 × 15 × 1.4 mm) Pb-free
