DESCRIPTION

The QSFCT245AT/CT and QSFCT2245AT/CT are 8-bit non-inverting transceivers that have three-state outputs which are useful for bus-oriented applications. The Transmit/Receive (T/R) input determines the direction of data flow, either from A to B or B to A, and the Output Enable ( $\overline{OE}$ ) input enables the selected port for output. The FCT2245AT/CT and FCT2640AT/CT are 25Ω resistor output versions useful for driving transmission lines and reducing system noise. The 2245 parts can replace the 245 series to reduce noise in an existing design. All inputs have clamp diode for undershoot noise suppression. All outputs have ground bounce suppression (see QSI Application Note AN-001), and outputs will not load an active bus when V<sub>CC</sub> is removed from the device.

Notes:

1. Typical values indicate  $V_{CC}=5.0\text{V}$  and  $T_A=25^{\circ}\text{C}$ .
2. Not more than one output should be shorted and the duration is  $\leq 1$  second.
3. These parameters are guaranteed by design but not tested.

**POWER SUPPLY CHARACTERISTICS**

Symbol	Parameter	Test Conditions (1)	Min	Max	Unit
Icc	Quiescent Power Supply Current	Vcc = MAX, freq = 0 0V ≤ Vin ≤ 0.2V or Vcc - 0.2V ≤ Vin ≤ Vcc	-	1.5	mA
ΔIcc	Supply Current per Input @ TTL HIGH	Vcc = MAX, Vin = 3.4 V, freq = 0 (2)	-	2.0	
Qccd	Supply Current per input per mHz	Vcc = MAX, Outputs open and enabled One bit toggling @ 50% duty cycle Other inputs at GND or Vcc (3,4)	-	0.25	mA/ MHz

1. For conditions shown as MIN or MAX use the appropriate values specified under DC specifications.
2. Per TTL driven input (Vi=3.4V)
3. For flipflops Qccd is measured by switching one of the data input pins so that the output changes every clock cycle. This is a measurement of device power consumption only and does not include power to drive load capacitance or tester capacitance. This parameter is guaranteed by design but not tested.
4. Ic can be computed using the above parameters as explained in the Technical Overview section.
