

**+/- 15kV ESD Protected, +3V to +5.5V, Low Power, 250kbps, RS-232 Transmitters/Receivers**

The Intersil ICL32X7E devices are 3V to 5.5V powered RS-232 transmitters (five)/receivers (three) which meet EIA/TIA-232 and V.28/V.24 specifications, even at  $V_{CC} = 3.0V$ . Additionally, they provide  $\pm 15kV$  ESD protection (IEC 1000-4-2 Air Gap) and  $\pm 15kV$  Human Body Model protection on transmitter outputs and receiver inputs (RS-232 pins). Targeted applications are ISDN Terminal Adaptors, PDAs, Palmtops, peripherals, and notebook and laptop computers where the low operational, and even lower standby, power consumption is critical. The ICL3217E's efficient on-chip charge pumps, coupled with an automatic powerdown function, reduces the standby supply current to a  $1\mu A$  trickle. Small footprint packaging, and the use of small, low value capacitors ensure board space savings as well. Data rates greater than 250kbps are guaranteed at worst case load conditions. This family is fully compatible with 3.3V-only systems, mixed 3.3V and 5V systems, and 5V-only systems, and is a lower power, pin-for-pin replacement for '207E and '237E type devices.

The **ICL3217E** features an **automatic powerdown** function which powers down the on-chip power-supply and driver circuits. This occurs when an attached peripheral device is shut off or the RS-232 cable is removed, conserving system power automatically, without changes to the hardware or operating system. The ICL3217E powers up again when a valid RS-232 voltage is applied to any receiver input.

Table 1 summarizes the features of the devices represented by this data sheet, while application Note AN9863 summarizes the features of each device comprising the ICL32XXE 3V family.

**Features**

- ESD Protection for RS-232 I/O Pins to  $\pm 15kV$  (IEC1000)
- 5V Lower Power Replacement for MAX207E, HIN207E, HIN237E
- Meets EIA/TIA-232 and V.28/V.24 Specifications at 3V
- Latch-Up Free
- On-Chip Voltage Converters Require Only Four External  $0.1\mu F$  Capacitors
- Automatic Powerdown ( $I_{CC} = 1\mu A$ , ICL3217E Only)
- Receiver Hysteresis For Improved Noise Immunity
- Guaranteed Minimum Data Rate . . . . . 250kbps
- Guaranteed Minimum Slew Rate . . . . .  $6V/\mu s$
- Wide Power Supply Range . . . . . Single +3V to +5.5V

**Applications**

- Any System Requiring RS-232 Communication Ports
  - Battery Powered, Hand-Held, and Portable Equipment
  - Laptop Computers, Notebooks, Palmtops
  - Modems, Printers and other Peripherals
  - ISDN Terminal Adaptors and Set Top Boxes

### Detailed Description

The ICL32X7E interface ICs operate from a single +3V to +5.5V power supply, guarantee a 250kbps minimum data rate, require only four small external 0.1 $\mu F$  capacitors, feature low power consumption, and meet all EIA RS-232C and V.28 specifications. The circuit is divided into three sections: charge pump, transmitters and receivers.

#### Charge-Pump

Intersil's new ICL32XXE family utilizes regulated on-chip dual charge pumps as voltage doublers, and voltage inverters to generate  $\pm 5.5V$  transmitter supplies from a  $V_{CC}$  supply as low as 3V. This allows these devices to maintain RS-232 compliant output levels over the  $\pm 10\%$  tolerance range of 3.3V powered systems. The efficient on-chip power supplies require only four small, external 0.1 $\mu F$  capacitors for the voltage doubler and inverter functions at  $V_{CC} = 3.3V$ . See the *Capacitor Selection* section, and Table 3 for capacitor recommendations for other operating conditions. The charge pumps operate discontinuously (i.e., they turn off as soon as the  $V_+$  and  $V_-$  supplies are pumped up to the nominal values), resulting in significant power savings.

### Transmitters

The transmitters are proprietary, low dropout, inverting drivers that translate TTL/CMOS inputs to EIA/TIA-232 output levels. Coupled with the on-chip  $\pm 5.5V$  supplies, these transmitters deliver true RS-232 levels over a wide range of single supply system voltages.

ICL3217E transmitter outputs disable and assume a high impedance state when the device enters the automatic powerdown mode. These outputs may be driven to  $\pm 12V$  when disabled.

Both devices guarantee a 250kbps data rate for full load conditions (3k $\Omega$  and 1000pF),  $V_{CC} \geq 3.0V$ , with one transmitter operating at full speed. Under more typical conditions of  $V_{CC} \geq 3.3V$ ,  $R_L = 3k\Omega$ , and  $C_L = 250pF$ , one transmitter easily operates at 800kbps.

Transmitter inputs float if left unconnected, and may cause  $I_{CC}$  increases. Connect unused inputs to GND for the best performance.

**Receivers**

The ICL32X7E each contain inverting receivers that convert RS-232 signals to CMOS output levels and accept inputs up to  $\pm 25V$  while presenting the required  $3k\Omega$  to  $7k\Omega$  input impedance (see Figure 1) even if the power is off ( $V_{CC} = 0V$ ). The receivers' Schmitt trigger input stage uses hysteresis to increase noise immunity and decrease errors due to slow input signal transitions.

Receivers on the ICL3207E are always active. The ICL3217E receivers disable when in the automatic powerdown state, thereby eliminating the possible current path through a shutdown peripheral's input protection diode (see Figures 2 and 3).

**Low Power Operation**

These 3V devices require a nominal supply current of 0.3mA, even at  $V_{CC} = 5.5V$ , during normal operation (not in powerdown mode). This is considerably less than the 11mA current required by comparable 5V RS-232 devices, allowing users to reduce system power simply by replacing the old style device with the ICL3207E.

**Low Power, Pin Compatible Replacement**

Pin compatibility with existing 5V products (e.g., MAX207E), coupled with the wide operating supply range, make the ICL32X7E potential lower power, higher performance drop-in replacements for existing '2X7E 5V applications. As long as the  $\pm 5V$  RS-232 output swings are acceptable, the ICL32X7E devices should work in most 5V applications.

FIGURE 1. INVERTING RECEIVER CONNECTIONS

FIGURE 2. POWER DRAIN THROUGH POWERED DOWN PERIPHERAL

FIGURE 3. DISABLED RECEIVERS PREVENT POWER DRAIN

When replacing a '207E or '237E device in an existing 5V application, it is acceptable to terminate  $C_3$  to  $V_{CC}$  as shown on the *Typical Operating Circuit*. Nevertheless, terminate  $C_3$  to GND if possible, as slightly better performance results from this configuration.

**Automatic Powerdown (ICL3217E Only)**

Even greater power savings is available by using the ICL3217E which features an automatic powerdown function. When no valid RS-232 voltages (see Figure 4) are sensed on any receiver input for  $30\mu s$ , the ICL3217E *automatically* enters its powerdown state (see Figure 5). In powerdown, supply current drops to  $1\mu A$ , because the on-chip charge pump turns off ( $V+$  collapses to  $V_{CC}$ ,  $V-$  collapses to GND), and the receiver and transmitter outputs three-state (see Table 2). This micro-power mode makes the ICL3217E ideal for battery powered and portable applications. Invalid receiver levels occur whenever the driving peripheral's outputs are shut off (powered down) or when the RS-232 interface cable is disconnected. The ICL3217E powers back up whenever it detects a valid RS-232 voltage level on any receiver input (such as when the RS-232 cable is reconnected). The time to recover from automatic powerdown mode is typically  $100\mu s$ .

TABLE 2. ICL3217E AUTOMATIC POWERDOWN OPERATION

RS-232 SIGNAL PRESENT AT RECEIVER INPUT?	TRANSMITTER OUTPUTS	RECEIVER OUTPUTS	MODE OF OPERATION
YES	Active	Active	Normal Operation
NO	High-Z	High-Z	Powerdown Due to Auto Powerdown Logic

FIGURE 4. DEFINITION OF VALID RS-232 RECEIVER LEVELS

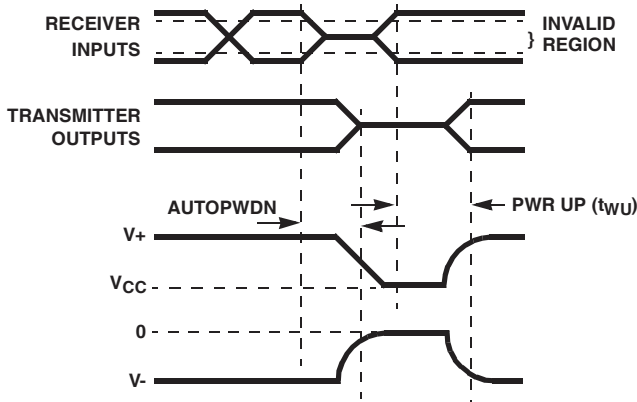

FIGURE 5. AUTOMATIC POWERDOWN TIMING DIAGRAM

This automatic powerdown feature provides additional system power savings without changes to the existing operating system or hardware.

Utilizing power management circuitry, to power down the rest of the communication circuitry (e.g., the UART) when the ICL3217E powers down, produces even greater power savings. Connecting a transition detector to the V- pin (see Figure 3) is an easy way for the power management logic to determine when the ICL3217E enters and exits powerdown.

### Capacitor Selection

The charge pumps require 0.1µF, or greater, capacitors for 3.3V operation. With 0.1µF capacitors, five percent tolerance supplies (e.g., 3.14V minimum) deliver greater than ±5V transmitter swings at full data rate, while ten percent tolerance supplies (e.g., 2.97V minimum) deliver ±4.95V transmitter swings. If greater than ±5V transmitter swings are required with a 10% tolerance 3.3V supply, 0.22µF capacitors are recommended (see Table 3). Existing 5V applications typically utilize either 0.1µF or 1µF capacitors, and the ICL32X7E works well with either value. New 5V designs should use 0.22µF capacitors for the best results. For other supply voltages refer to Table 3 for capacitor values. Do not use values smaller than those listed in Table 3. Increasing the capacitor values (by a factor of two)

reduces ripple on the transmitter outputs and slightly reduces power consumption. C<sub>2</sub>, C<sub>3</sub>, and C<sub>4</sub> can be increased without increasing C<sub>1</sub>'s value, however, do not increase C<sub>1</sub> without also increasing C<sub>2</sub>, C<sub>3</sub>, and C<sub>4</sub> to maintain the proper ratios (C<sub>1</sub> to the other capacitors).

When using minimum required capacitor values, make sure that capacitor values do not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR) usually rises at low temperatures and it influences the amount of ripple on V+ and V-.

TABLE 3. REQUIRED CAPACITOR VALUES

V <sub>CC</sub> (V)	C <sub>1</sub> (µF)	C <sub>2</sub> , C <sub>3</sub> , C <sub>4</sub> (µF)
3.15 to 3.6	0.1	0.1
3.0 to 3.6	0.22	0.22
4.5 to 5.5	0.1 to 1.0	0.1 to 1.0
3.0 to 5.5	0.22	0.22

### Power Supply Decoupling

In most circumstances a 0.1µF bypass capacitor is adequate. In applications that are particularly sensitive to power supply noise, decouple V<sub>CC</sub> to ground with a capacitor of the same value as the charge-pump capacitor C<sub>1</sub>. Connect the bypass capacitor as close as possible to the IC.

### Transmitter Outputs when Exiting Powerdown

Figure 6 shows the response of two ICL3217E transmitter outputs when exiting powerdown mode. As they activate, the two transmitter outputs properly go to opposite RS-232 levels, with no glitching, ringing, nor undesirable transients. Each transmitter is loaded with 3kΩ in parallel with 2500pF. Note that the transmitters enable only when the magnitude of the supplies exceed approximately 3V.

FIGURE 6. TRANSMITTER OUTPUTS WHEN EXITING POWERDOWN (ICL3217E ONLY)

**Operation down to 2.7V**

ICL32X7E transmitter outputs meet RS-562 levels ( $\pm 3.7V$ ) with  $V_{CC}$  as low as 2.7V. RS-562 levels typically ensure interoperability with RS-232 devices.

**High Data Rates**

The ICL32XX maintain the RS-232  $\pm 5V$  minimum transmitter output voltages even at high data rates. Figure 7 details a transmitter loopback test circuit, and Figure 8 illustrates the loopback test result at 120kbps. For this test, all transmitters were simultaneously driving RS-232 loads in parallel with 1000pF, at 120kbps. Figure 9 shows the loopback results for a single transmitter driving 1000pF and an RS-232 load at 250kbps. The static transmitters were also loaded with an RS-232 receiver.

FIGURE 7. TRANSMITTER LOOPBACK TEST CIRCUIT

FIGURE 8. LOOPBACK TEST AT 120kbps

FIGURE 9. LOOPBACK TEST AT 250kbps

**Interconnection with 3V and 5V Logic**

The ICL32X7E directly interface with 5V CMOS and TTL logic families. Nevertheless, with the ICL32X7E at 3.3V, and the logic supply at 5V, AC, HC, and CD4000 outputs can drive ICL32X7E inputs, but ICL32X7E outputs do not reach the minimum  $V_{IH}$  for these logic families. See Table 4 for more information.

TABLE 4. LOGIC FAMILY COMPATIBILITY WITH VARIOUS SUPPLY VOLTAGES

SYSTEM POWER-SUPPLY VOLTAGE (V)	$V_{CC}$ SUPPLY VOLTAGE (V)	COMPATIBILITY
3.3	3.3	Compatible with all CMOS families.
5	5	Compatible with all TTL and CMOS logic families.
5	3.3	Compatible with ACT and HCT CMOS, and with TTL. ICL32X7E outputs are incompatible with AC, HC, and CD4000 CMOS inputs.

**$\pm 15kV$  ESD Protection**

All pins on ICL32XX devices include ESD protection structures, but the ICL32X7E incorporate advanced structures which allow the RS-232 pins (transmitter outputs and receiver inputs) to survive ESD events up to  $\pm 15kV$ . The RS-232 pins are particularly vulnerable to ESD damage because they typically connect to an exposed port on the exterior of the finished product. Simply touching the port pins, or connecting a cable, can cause an ESD event that might destroy unprotected ICs. These new ESD structures protect the device whether or not it is powered up, protect without allowing any latchup mechanism to activate, and don't interfere with RS-232 signals as large as  $\pm 25V$ .

**Human Body Model (HBM) Testing**

As the name implies, this test method emulates the ESD event delivered to an IC during human handling. The tester delivers the charge through a 1.5kΩ current limiting resistor, making the test less severe than the IEC-1000 test which utilizes a 330Ω limiting resistor. The HBM method determines an IC's ability to withstand the ESD transients typically present during handling and manufacturing. Due to the random nature of these events, each pin is tested with respect to all other pins. The RS-232 pins on "E" family devices can withstand HBM ESD events to ±15kV.

**IEC1000-4-2 Testing**

The IEC 1000 test method applies to finished equipment, rather than to an individual IC. Therefore, the pins most likely to suffer an ESD event are those that are exposed to the outside world (the RS-232 pins in this case), and the IC is tested in its typical application configuration (power applied) rather than testing each pin-to-pin combination. The lower current limiting resistor coupled with the larger charge storage capacitor yields a test that is much more severe than

the HBM test. The extra ESD protection built into this device's RS-232 pins allows the design of equipment meeting level 4 criteria without the need for additional board level protection on the RS-232 port.

**AIR-GAP DISCHARGE TEST METHOD**

For this test method, a charged probe tip moves toward the IC pin until the voltage arcs to it. The current waveform delivered to the IC pin depends on approach speed, humidity, temperature, etc., so it is difficult to obtain repeatable results. The "E" device RS-232 pins withstand ±15kV air-gap discharges.

**CONTACT DISCHARGE TEST METHOD**

During the contact discharge test, the probe contacts the tested pin before the probe tip is energized, thereby eliminating the variables associated with the air-gap discharge. The result is a more repeatable and predictable test, but equipment limits prevent testing devices at voltages higher than ±8kV. All "E" family devices survive ±8kV contact discharges on the RS-232 pins.

**Typical Performance Curves**  $V_{CC} = 3.3V, T_A = 25^{\circ}C$

2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.20mm (0.0078 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.20mm (0.0078 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. Dimension "B" does not include dambar protrusion. Allowable dambar protrusion shall be 0.13mm (0.005 inch) total in excess of "B" dimension at maximum material condition.
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.

**NOTES:**

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch)
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
