## Datasheet

## PART NUMBER <br> TS80C186EA-20-ROC

## Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All re-creations are done with the approval of the Original Component Manufacturer. (OCM)

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

## Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-38535
- Class Q Military
- Class V Space Level

Qualified Suppliers List of Distributors (QSLD)

- Rochester is a critical supplier to DLA and meets all industry and DLA standards.
Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OCM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

## 80C186EA/80C188EA AND 80L186EA/80L188EA 16-BIT HIGH-INTEGRATION EMBEDDED PROCESSORS

## ■ 80C186 Upgrade for Power Critical Applications <br> - Fully Static Operation <br> ■ True CMOS Inputs and Outputs

■ Integrated Feature Set

- Static 186 CPU Core
- Power Save, Idle and Powerdown Modes
- Clock Generator
- 2 Independent DMA Channels
- 3 Programmable 16-Bit Timers
- Dynamic RAM Refresh Control Unit
- Programmable Memory and Peripheral Chip Select Logic
- Programmable Wait State Generator
- Local Bus Controller
- System-Level Testing Support (High Impedance Test Mode)
- Speed Versions Available (5V):
- 25 MHz (80C186EA25/80C188EA25)
- 20 MHz (80C186EA20/80C188EA20)
- 13 MHz (80C186EA13/80C188EA13)

■ Speed Versions Available (3V):

- 13 MHz (80L186EA13/80L188EA13)
- 8 MHz (80L186EA8/80L188EA8)
- Direct Addressing Capability to 1 Mbyte Memory and 64 Kbyte I/O
- Supports 80C187 Numeric Coprocessor Interface (80C186EA only)
■ Available in the Following Packages: -68-Pin Plastic Leaded Chip Carrier (PLCC)
- 80-Pin EIAJ Quad Flat Pack (QFP)
- 80-Pin Shrink Quad Flat Pack (SQFP)

■ Available in Extended Temperature Range ( $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ )

The 80 C 186 EA is a CHMOS high integration embedded microprocessor. The 80C186EA includes all of the features of an "Enhanced Mode" 80C186 while adding the additional capabilities of Idle and Powerdown Modes. In Numerics Mode, the 80C186EA interfaces directly with an 80C187 Numerics Coprocessor.

## INTRODUCTION

Unless specifically noted, all references to the 80C186EA apply to the 80C188EA, 80L186EA, and 80L188EA. References to pins that differ between the 80C186EA/80L186EA and the 80C188EA/ 80L188EA are given in parentheses. The " $L$ " in the part number denotes low voltage operation. Physically and functionally, the " $C$ " and " $L$ " devices are identical.

The 80C186EA is the second product in a new generation of low-power, high-integration microprocessors. It enhances the existing 80C186XL family by offering new features and operating modes. The 80C186EA is object code compatible with the 80C186XL embedded processor.

The 80L186EA is the 3 V version of the 80C186EA. The 80L186EA is functionally identical to the 80C186EA embedded processor. Current 80C186EA customers can easily upgrade their designs to use the 80L186EA and benefit from the reduced power consumption inherent in 3 V operation.

The feature set of the 80C186EA/80L186EA meets the needs of low-power, space-critical applications. Low-power applications benefit from the static design of the CPU core and the integrated peripherals as well as low voltage operation. Minimum current consumption is achieved by providing a Powerdown Mode that halts operation of the device, and freezes the clock circuits. Peripheral design enhancements ensure that non-initialized peripherals consume little current.

Space-critical applications benefit from the integration of commonly used system peripherals. Two flexible DMA channels perform CPU-independent data transfers. A flexible chip select unit simplifies memory and peripheral interfacing. The interrupt unit provides sources for up to 128 external interrupts and will prioritize these interrupts with those generated from the on-chip peripherals. Three general purpose timer/counters round out the feature set of the 80C186EA.

Figure 1 shows a block diagram of the 80C186EA/ 80C188EA. The Execution Unit (EU) is an enhanced 8086 CPU core that includes: dedicated hardware to speed up effective address calculations, enhance execution speed for multiple-bit shift and rotate instructions and for multiply and divide instructions, string move instructions that operate at full bus bandwidth, ten new instructions, and static operation. The Bus Interface Unit (BIU) is the same as that found on the original 80C186 family products. An independent internal bus is used to allow communication between the BIU and internal peripherals.

## 80C186EA CORE ARCHITECTURE

## Bus Interface Unit

The 80C186EA core incorporates a bus controller that generates local bus control signals. In addition, it employs a HOLD/HLDA protocol to share the local bus with other bus masters.

The bus controller is responsible for generating 20 bits of address, read and write strobes, bus cycle status information and data (for write operations) information. It is also responsible for reading data off the local bus during a read operation. SRDY and ARDY input pins are provided to extend a bus cycle beyond the minimum four states (clocks).

The local bus controller also generates two control signals ( $\overline{\mathrm{DEN}}$ and $\mathrm{DT} / \overline{\mathrm{R}}$ ) when interfacing to external transceiver chips. This capability allows the addition of transceivers for simple buffering of the mulitplexed address/data bus.

## Clock Generator

The processor provides an on-chip clock generator for both internal and external clock generation. The clock generator features a crystal oscillator, a divide-by-two counter, and two low-power operating modes.

The oscillator circuit is designed to be used with either a parallel resonant fundamental or third-overtone mode crystal network. Alternatively, the oscillator circuit may be driven from an external clock source. Figure 2 shows the various operating modes of the oscillator circuit.

The crystal or clock frequency chosen must be twice the required processor operating frequency due to the internal divide-by-two counter. This counter is used to drive all internal phase clocks and the external CLKOUT signal. CLKOUT is a $50 \%$ duty cycle processor clock and can be used to drive other system components. All AC timings are referenced to CLKOUT.

The following parameters are recommended when choosing a crystal:

Temperature Range: Application Specific
ESR (Equivalent Series Resistance): $\quad 60 \Omega$ max C0 (Shunt Capacitance of Crystal): $\quad 7.0 \mathrm{pF}$ max $C_{L}$ (Load Capacitance): $\quad 20 \mathrm{pF} \pm 2 \mathrm{pF}$ Drive Level: 2 mW max

(A) Crystal Connection

272432-3
(B) Clock Connection

NOTE:
The $L_{1} C_{1}$ network is only required when using a third-overtone crystal.
Figure 2. Clock Configurations

## 80C186EA PERIPHERAL ARCHITECTURE

The 80C186EA has integrated several common system peripherals with a CPU core to create a compact, yet powerful system. The integrated peripherals are designed to be flexible and provide logical interconnections between supporting units (e.g., the interrupt control unit supports interrupt requests from the timer/counters or DMA channels).

The list of integrated peripherals include:

- 4-Input Interrupt Control Unit
- 3-Channel Timer/Counter Unit
- 2-Channel DMA Unit
- 13-Output Chip-Select Unit
- Refresh Control Unit
- Power Management logic

The registers associated with each integrated periheral are contained within a $128 \times 16$ register file called the Peripheral Control Block (PCB). The PCB can be located in either memory or I/O space on any 256 byte address boundary.

Figure 3 provides a list of the registers associated with the PCB when the processor's Interrupt Control Unit is in Master Mode. In Slave Mode, the definitions of some registers change. Figure 4 provides register definitions specific to Slave Mode.

## Interrupt Control Unit

The 80C186EA can receive interrupts from a number of sources, both internal and external. The Interrupt Control Unit (ICU) serves to merge these requests on a priority basis, for individual service by the CPU. Each interrupt source can be independently masked by the Interrupt Control Unit or all interrupts can be globally masked by the CPU.

Internal interrupt sources include the Timers and DMA channels. External interrupt sources come from the four input pins INT3:0. The NMI interrupt pin is not controlled by the ICU and is passed directly to the CPU. Although the timers only have one request input to the ICU, separate vector types are generated to service individual interrupts within the Timer Unit.

## Timer/Counter Unit

The 80C186EA Timer/Counter Unit (TCU) provides three 16-bit programmable timers. Two of these are highly flexible and are connected to external pins for control or clocking. A third timer is not connected to any external pins and can only be clocked internally. However, it can be used to clock the other two timer channels. The TCU can be used to count external events, time external events, generate non-repetitive waveforms, generate timed interrupts, etc.

## DMA Control Unit

The 80C186EA DMA Contol Unit provides two independent high-speed DMA channels. Data transfers can occur between memory and I/O space in any combination: memory to memory, memory to I/O, I/O to I/O or I/O to memory. Data can be transferred either in bytes or words. Transfers may proceed to or from either even or odd addresses, but even-aligned word transfers proceed at a faster rate. Each data transfer consumes two bus cycles (a minimum of eight clocks), one cycle to fetch data and the other to store data. The chip-select/ready logic may be programmed to point to the memory or 1/O space subject to DMA transfers in order to provide hardware chip select lines. DMA cycles run at higher priority than general processor execution cycles.

## Chip-Select Unit

The 80C186EA Chip-Select Unit integrates logic which provides up to 13 programmable chip-selects to access both memories and peripherals. In addition, each chip-select can be programmed to automatically terminate a bus cycle independent of the condition of the SRDY and ARDY input pins. The chip-select lines are available for all memory and I/O bus cycles, whether they are generated by the CPU, the DMA unit, or the Refresh Control Unit.

## Refresh Control Unit

The Refresh Control Unit (RCU) automatically generates a periodic memory read bus cycle to keep dynamic or pseudo-static memory refreshed. A 9-bit counter controls the number of clocks between refresh requests.

A 9-bit address generator is maintained by the RCU with the address presented on the A9:1 address lines during the refresh bus cycle. Address bits A19:13 are programmable to allow the refresh address block to be located on any 8 Kbyte boundary.

## Power Management

The 80C186EA has three operational modes to control the power consumption of the device. They are Power Save Mode, Idle Mode, and Powerdown Mode.

Power Save Mode divides the processor clock by a programmable value to take advantage of the fact that current is linearly proportional to frequency. An unmasked interrupt, NMI, or reset will cause the 80C186EA to exit Power Save Mode.

Idle Mode freezes the clocks of the Execution Unit and the Bus Interface Unit at a logic zero state while all peripherals operate normally.

Powerdown Mode freezes all internal clocks at a logic zero level and disables the crystal oscillator. All internal registers hold their values provided $\mathrm{V}_{\mathrm{CC}}$ is maintained. Current consumption is reduced to transistor leakage only.

## 80C187 Interface (80C186EA Only)

The 80C187 Numerics Coprocessor may be used to extend the 80C186EA instruction set to include floating point and advanced integer instructions. Connecting the 80C186EA RESOUT and TEST/ BUSY pins to the 80C187 enables Numerics Mode operation. In Numerics Mode, three of the four MidRange Chip Select (MCS) pins become handshaking pins for the interface. The exchange of data and control information proceeds through four dedicated I/O ports.

If an 80C187 is not present, the 80C186EA configures itself for regular operation at reset.

## NOTE:

The 80 C 187 is not specified for 3 V operation and therefore does not interface directly to the 80L186EA.

## ONCE Test Mode

To facilitate testing and inspection of devices when fixed into a target system, the 80C186EA has a test mode available which forces all output and input/ output pins to be placed in the high-impedance state. ONCE stands for "ON Circuit Emulation". The ONCE mode is selected by forcing the UCS and $\overline{\mathrm{LCS}}$ pins LOW (0) during a processor reset (these pins are weakly held to a HIGH (1) level) while RESIN is active.

## DIFFERENCES BETWEEN THE 80C186XL AND THE 80C186EA

The 80C186EA is intended as a direct functional upgrade for 80C186XL designs. In many cases, it will be possible to replace an existing 80C186XL with little or no hardware redesign. The following sections describe differences in pinout, operating modes, and AC and DC specifications to keep in mind.

## Pinout Compatibility

The 80C186EA requires a PDTMR pin to time the processor's exit from Powerdown Mode. The original pin arrangement for the 80C186XL in the PLCC package did not have any spare leads to use for PDTMR, so the DT/ $\bar{R}$ pin was sacrificed. The arrangement of all the other leads in the 68-lead PLCC is identical between the 80 C 186 XL and the 80C186EA. DT/R may be synthesized by latching the $\overline{\mathrm{S} 1}$ status output. Therefore, upgrading a PLCC 80C186XL to PLCC 80C186EA is straightforward.

The 80-lead QFP (EIAJ) pinouts are different between the 80C186XL and the 80C186EA. In addition to the PDTMR pin, the 80C186EA has more power and ground pins and the overall arrangement of pins was shifted. A new circuit board layout for the 80C186EA is required.

## Operating Modes

The 80C186XL has two operating modes, Compatible and Enhanced. Compatible Mode is a pin-to-pin replacement for the NMOS 80186, except for numerics coprocessing. In Enhanced Mode, the processor has a Refresh Control Unit, the Power-Save feature and an interface to the 80C187 Numerics Coprocessor. The $\overline{\mathrm{MCSO}}, \overline{\mathrm{MCS} 1}$, and $\overline{\mathrm{MCS3}}$ pins change their functions to constitute handshaking pins for the 80C187.

The 80C186EA allows all non-80C187 users to use all the $\overline{\mathrm{MCS}}$ pins for chip-selects. In regular operation, all 80C186EA features (including those of the Enhanced Mode 80C186) are present except for the interface to the 80C187. Numerics Mode disables the three chip-select pins and reconfigures them for connection to the 80 C 187 .

## TTL vs CMOS Inputs

The inputs of the 80C186EA are rated for CMOS switching levels for improved noise immunity, but the 80C186XL inputs are rated for TTL switching levels. In particular, the 80C186EA requires a minimum $\mathrm{V}_{\mathrm{IH}}$ of 3.5 V to recognize a logic one while the 80 C 186 XL requires a minimum $\mathrm{V}_{\mathrm{IH}}$ of only 1.9 V (assuming 5.0 V operation). The solution is to drive the 80C186EA with true CMOS devices, such as those from the HC and AC logic families, or to use pullup resistors where the added current draw is not a problem.

## Timing Specifications

80C186EA timing relationships are expressed in a simplified format over the 80C186XL. The AC performance of an 80C186EA at a specified frequency will be very close to that of an 80C186XL at the same frequency. Check the timings applicable to your design prior to replacing the 80C186XL.

## PACKAGE INFORMATION

This section describes the pins, pinouts, and thermal characteristics for the 80C186EA in the Plastic Leaded Chip Carrier (PLCC) package, Shrink Quad Flat Pack (SQFP), and Quad Flat Pack (QFP) package. For complete package specifications and information, see the Intel Packaging Outlines and Dimensions Guide (Order Number: 231369).

With the extended temperature range operational characteristics are guaranteed over a temperature range corresponding to $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ ambient. Package types are identified by a two-letter prefix to the part number. The prefixes are listed in Table 1.

Table 1. Prefix Identification

| Prefix | Note | Package <br> Type | Temperature <br> Range |
| :--- | :---: | :--- | :--- |
| TN |  | PLCC | Extended |
| TS |  | QFP (EIAJ) | Extended |
| SB | 1 | SQFP | Extended/Commercial |
| N | 1 | PLCC | Commercial |
| S | 1 | QFP (EIAJ) | Commercial |

NOTE:

1. The 25 MHz version is only available in commercial temperature range corresponding to $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ ambient.

## Pin Descriptions

Each pin or logical set of pins is described in Table 3. There are three columns for each entry in the Pin Description Table.

The Pin Name column contains a mnemonic that describes the pin function. Negation of the signal name (for example, $\overline{\mathrm{RESIN}}$ ) denotes a signal that is active low.

The Pin Type column contains two kinds of information. The first symbol indicates whether a pin is power (P), ground (G), input only (I), output only (O) or
input/output (I/O). Some pins have multiplexed functions (for example, A19/S6). Additional symbols indicate additional characteristics for each pin. Table 3 lists all the possible symbols for this column.

The Input Type column indicates the type of input (asynchronous or synchronous).

Asynchronous pins require that setup and hold times be met only in order to guarantee recognition at a particular clock edge. Synchronous pins require that setup and hold times be met to guarantee proper operation. For example, missing the setup or hold time for the SRDY pin (a synchronous input) will result in a system failure or lockup. Input pins may also be edge- or level-sensitive. The possible characteristics for input pins are $S(E), S(L), A(E)$ and $A(L)$.

The Output States column indicates the output state as a function of the device operating mode. Output states are dependent upon the current activity of the processor. There are four operational states that are different from regular operation: bus hold, reset, Idle Mode and Powerdown Mode. Appropriate characteristics for these states are also indicated in this column, with the legend for all possible characteristics in Table 2.

The Pin Description column contains a text description of each pin.

As an example, consider AD15:0. I/O signifies the pins are bidirectional. $S(\mathrm{~L})$ signifies that the input function is synchronous and level-sensitive. $\mathrm{H}(\mathrm{Z})$ signifies that, as outputs, the pins are high-impedance upon acknowledgement of bus hold. $R(Z)$ signifies that the pins float during reset. $P(X)$ signifies that the pins retain their states during Powerdown Mode.

Table 2. Pin Description Nomenclature

| Symbol | Description |
| :---: | :---: |
| $\begin{aligned} & \hline P \\ & G \\ & \mathrm{I} \\ & \mathrm{O} \\ & \mathrm{I} / \mathrm{O} \end{aligned}$ | Power Pin (Apply $+\mathrm{V}_{\mathrm{CC}}$ Voltage) <br> Ground (Connect to $\mathrm{V}_{\mathrm{SS}}$ ) <br> Input Only Pin <br> Output Only Pin <br> Input/Output Pin |

Table 3. Pin Descriptions

| Pin Name | $\begin{gathered} \hline \text { Pin } \\ \text { Type } \end{gathered}$ | Input Type | Output States | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {cc }}$ | P |  |  | POWER connections consist of six pins which must be shorted externally to a $\mathrm{V}_{\mathrm{CC}}$ board plane. |
| $\mathrm{V}_{\text {SS }}$ | G |  |  | GROUND connections consist of five pins which must be shorted externally to a $\mathrm{V}_{\mathrm{SS}}$ board plane. |
| CLKIN | 1 | A(E) |  | CLocK INput is an input for an external clock. An external oscillator operating at two times the required processor operating frequency can be connected to CLKIN. For crystal operation, CLKIN (along with OSCOUT) are the crystal connections to an internal Pierce oscillator. |
| OSCOUT | 0 |  | $\begin{aligned} & \hline H(Q) \\ & R(Q) \\ & P(Q) \end{aligned}$ | OSCillator OUTput is only used when using a crystal to generate the external clock. OSCOUT (along with CLKIN) are the crystal connections to an internal Pierce oscillator. This pin is not to be used as 2X clock output for non-crystal applications (i.e., this pin is N.C. for non-crystal applications). OSCOUT does not float in ONCE mode. |
| CLKOUT | 0 |  | $\begin{aligned} & \hline H(Q) \\ & R(Q) \\ & P(Q) \end{aligned}$ | CLocK OUTput provides a timing reference for inputs and outputs of the processor, and is one-half the input clock (CLKIN) frequency. CLKOUT has a $50 \%$ duty cycle and transistions every falling edge of CLKIN. |
| RESIN | 1 | A(L) |  | RESet IN causes the processor to immediately terminate any bus cycle in progress and assume an initialized state. All pins will be driven to a known state, and RESOUT will also be driven active. The rising edge (low-to-high) transition synchronizes CLKOUT with CLKIN before the processor begins fetching opcodes at memory location OFFFFOH. |
| RESOUT | 0 |  | $\begin{aligned} & H(0) \\ & R(1) \\ & P(0) \end{aligned}$ | RESet OUTput that indicates the processor is currently in the reset state. RESOUT will remain active as long as RESIN remains active. When tied to the TEST/BUSY pin, RESOUT forces the 80C186EA into Numerics Mode. |
| PDTMR | 1/O | A(L) | $\begin{gathered} \hline \mathrm{H}(\mathrm{WH}) \\ \mathrm{R}(\mathrm{Z}) \\ \mathrm{P}(1) \end{gathered}$ | Power-Down TiMeR pin (normally connected to an external capacitor) that determines the amount of time the processor waits after an exit from power down before resuming normal operation. The duration of time required will depend on the startup characteristics of the crystal oscillator. |
| NMI | 1 | A(E) |  | Non-Maskable Interrupt input causes a Type 2 interrupt to be serviced by the CPU. NMI is latched internally. |
| TEST/BUSY (TEST) | 1 | A(E) |  | TEST/BUSY is sampled upon reset to determine whether the 80C186EA is to enter Numerics Mode. In regular operation, the pin is TEST. TEST is used during the execution of the WAIT instruction to suspend CPU operation until the pin is sampled active (low). In Numerics Mode, the pin is BUSY. BUSY notifies the 80C186EA of 80C187 Numerics Coprocessor activity. |
| $\begin{array}{\|l} \hline \text { AD15:0 } \\ \text { (AD7:0) } \end{array}$ | I/O | S(L) | $\begin{aligned} & \mathrm{H}(\mathrm{Z}) \\ & \mathrm{R}(\mathrm{Z}) \\ & \mathrm{P}(\mathrm{X}) \end{aligned}$ | These pins provide a multiplexed Address and Data bus. During the address phase of the bus cycle, address bits 0 through 15 ( 0 through 7 on the 8 -bit bus versions) are presented on the bus and can be latched using ALE. 8 - or 16 -bit data information is transferred during the data phase of the bus cycle. |

NOTE:
Pin names in parentheses apply to the 80C188EA and 80L188EA.

Table 3. Pin Descriptions (Continued)

| Pin <br> Name | Pin <br> Type | Input <br> Type | Output States | Description |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { A18:16 } \\ & \text { A19/S6-A16 } \\ & \text { (A19-A8) } \end{aligned}$ | O |  | $\begin{aligned} & \hline H(Z) \\ & R(Z) \\ & P(X) \end{aligned}$ | These pins provide multiplexed Address during the address phase of the bus cycle. Address bits 16 through 19 are presented on these pins and can be latched using ALE. A18:16 are driven to a logic 0 during the data phase of the bus cycle. On the 8 -bit bus versions, A15-A8 provide valid address information for the entire bus cycle. Also during the data phase, S 6 is driven to a logic 0 to indicate a CPU-initiated bus cycle or logic 1 to indicate a DMA-initiated bus cycle or a refresh cycle. |  |  |
| $\overline{\text { S2:0 }}$ | 0 |  | $\begin{aligned} & \hline H(Z) \\ & R(Z) \end{aligned}$ | Bus cycle Status are encoded on these pins to provide bus transaction information. $\overline{\text { S2:0 }}$ are encoded as follows: |  |  |
|  |  |  | P (1) | $\overline{\mathrm{S} 2} \mathrm{~S}$ | So | Bus Cycle Initiated |
|  |  |  |  | O S <br> 0 0 <br> 0 0 <br> 0 1 <br> 0 1 <br> 1 0 <br> 1 0 <br> 1 1 <br> 1 1 | 0 1 0 1 0 1 0 1 | Interrupt Acknowledge <br> Read I/O <br> Write I/O <br> Processor HALT <br> Queue Instruction Fetch <br> Read Memory <br> Write Memory <br> Passive (no bus activity) |
| ALE/QSO | 0 |  | $\begin{aligned} & \hline H(0) \\ & R(0) \\ & P(0) \end{aligned}$ | Address Latch Enable output is used to strobe address information into a transparent type latch during the address phase of the bus cycle. In Queue Status Mode, QSO provides queue status information along with QS1. |  |  |
| $\begin{aligned} & \hline \overline{\overline{\mathrm{BHE}}} \\ & (\overline{\mathrm{RFSH}}) \end{aligned}$ | 0 |  | $\begin{aligned} & \hline \mathrm{H}(\mathrm{Z}) \\ & \mathrm{R}(\mathrm{Z}) \\ & \mathrm{P}(\mathrm{X}) \end{aligned}$ | Byte High Enable output to indicate that the bus cycle in progress is transferring data over the upper half of the data bus. $\overline{B H E}$ and AO have the following logical encoding: |  |  |
|  |  |  |  | A0 | $\overline{\text { BHE }}$ | Encoding (For 80C186EA/80L186EA Only) |
|  |  |  |  | 0 0 1 1 | 0 1 0 1 | Word Transfer Even Byte Transfer Odd Byte Transfer Refresh Operation |
|  |  |  |  | On the 80C188EA/80L188EA, RFSH is asserted low to indicate a Refresh bus cycle. |  |  |
| $\overline{\mathrm{RD}} / \overline{\mathrm{QSMD}}$ | 0 |  | R(WH) $P(1)$ | ReaD output signals that the accessed memory or I/O device must drive data information onto the data bus. Upon reset, this pin has an alternate function. As $\overline{\text { QSMD, }}$, it enables Queue Status Mode when grounded. In Queue Status Mode, the ALE/QS0 and WR/QS1 pins provide the following information about processor/instruction queue interaction: |  |  |
|  |  |  |  | QS1 | QSO | Queue Operation |
|  |  |  |  | 0 0 1 1 | 0 1 1 0 | No Queue Operation <br> First Opcode Byte Fetched from the Queue Subsequent Byte Fetched from the Queue Empty the Queue |

## NOTE:

Pin names in parentheses apply to the 80C188EA and 80L188EA.

Table 3. Pin Descriptions (Continued)

| Pin Name | $\begin{gathered} \hline \text { Pin } \\ \text { Tvpe } \end{gathered}$ | Input Type | Output States | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\overline{\mathrm{WR}} / \mathrm{QS} 1$ | $\bigcirc$ |  | $\begin{aligned} & \hline H(Z) \\ & R(Z) \\ & P(1) \end{aligned}$ | WRite output signals that data available on the data bus are to be written into the accessed memory or I/O device. In Queue Status Mode, QS1 provides queue status information along with QSO. |
| ARDY | 1 | $\begin{aligned} & \hline A(L) \\ & S(L) \end{aligned}$ |  | Asychronous ReaDY is an input to signal for the end of a bus cycle. ARDY is asynchronous on rising CLKOUT and synchronous on falling CLKOUT. ARDY or SRDY must be active to terminate any processor bus cycle, unless they are ignored due to correct programming of the Chip Select Unit. |
| SRDY | 1 | S(L) |  | Synchronous ReaDY is an input to signal for the end of a bus cycle. ARDY or SRDY must be active to terminate any processor bus cycle, unless they are ignored due to correct programming of the Chip Select Unit. |
| $\overline{\mathrm{DEN}}$ | 0 | $\begin{aligned} & \mathrm{H}(\mathrm{Z}) \\ & \mathrm{R}(\mathrm{Z}) \\ & \mathrm{P}(1) \\ & \hline \end{aligned}$ |  | Data ENable output to control the enable of bidirectional transceivers when buffering a system. $\overline{D E N}$ is active only when data is to be transferred on the bus. |
| DT/ $\bar{R}$ | 0 |  | $\begin{aligned} & \hline H(Z) \\ & R(Z) \\ & P(X) \end{aligned}$ | Data Transmit/Receive output controls the direction of a bidirectional buffer in a buffered system. DT/ $\bar{R}$ is only available on the QFP (EIAJ) package and the SQFP package. |
| $\overline{\text { LOCK }}$ | 0 |  | $\begin{gathered} \mathrm{H}(\mathrm{Z}) \\ \mathrm{R}(\mathrm{WH}) \\ \mathrm{P}(1) \end{gathered}$ | LOCK output indicates that the bus cycle in progress is not to be interrupted. The processor will not service other bus requests (such as HOLD) while LOCK is active. This pin is configured as a weakly held high input while RESIN is active and must not be driven low. |
| HOLD | 1 | A(L) |  | HOLD request input to signal that an external bus master wishes to gain control of the local bus. The processor will relinquish control of the local bus between instruction boundaries not conditioned by a LOCK prefix. |
| HLDA | 0 |  | $\begin{aligned} & H(1) \\ & R(0) \\ & P(0) \end{aligned}$ | HoLD Acknowledge output to indicate that the processor has relinquished control of the local bus. When HLDA is asserted, the processor will (or has) floated its data bus and control signals allowing another bus master to drive the signals directly. |
| $\overline{\text { UCS }}$ | 0 |  | $\begin{aligned} & \hline H(1) \\ & R(1) \\ & P(1) \end{aligned}$ | Upper Chip Select will go active whenever the address of a memory or I/O bus cycle is within the address limitations programmed by the user. After reset, UCS is configured to be active for memory accesses between OFFCOOH and OFFFFFH. During a processor reset, UCS and $\overline{\text { LCS }}$ are used to enable ONCE Mode. |
| $\overline{\text { LCS }}$ | 0 |  | $\begin{aligned} & \hline H(1) \\ & R(1) \\ & P(1) \end{aligned}$ | Lower Chip Select will go active whenever the address of a memory bus cycle is within the address limitations programmed by the user. $\overline{\text { LCS }}$ is inactive after a reset. During a processor reset, $\overline{U C S}$ and $\overline{\text { LCS }}$ are used to enable ONCE Mode. |

NOTE:
Pin names in parentheses apply to the 80C188EA and 80L188EA.

Table 3. Pin Descriptions (Continued)

| Pin Name | $\begin{gathered} \text { Pin } \\ \text { Type } \end{gathered}$ | Input Type | Output States | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\overline{M C S O} / P E R E Q$ <br> $\overline{\text { MCS1 }} / \overline{\text { ERROR }}$ <br> MCS2 <br> $\overline{\mathrm{MCS}} / \overline{\mathrm{NCS}}$ | I/O | A(L) | $\begin{aligned} & H(1) \\ & R(1) \\ & P(1) \end{aligned}$ | These pins provide a multiplexed function. If enabled, these pins normally comprise a block of Mid-Range Chip Select outputs which will go active whenever the address of a memory bus cycle is within the address limitations programmed by the user. In Numerics Mode (80C186EA only), three of the pins become handshaking pins for the 80C187. The CoProcessor REQuest input signals that a data transfer is pending. ERROR is an input which indicates that the previous numerics coprocessor operation resulted in an exception condition. An interrupt Type 16 is generated when ERROR is sampled active at the beginning of a numerics operation. Numerics Coprocessor Select is an output signal generated when the processor accesses the 80C187. |
| $\overline{\text { PCS4:0 }}$ | 0 |  | $\begin{aligned} & \hline H(1) \\ & R(1) \\ & P(1) \\ & \hline \end{aligned}$ | Peripheral Chip Selects go active whenever the address of a memory or I/O bus cycle is within the address limitations programmed by the user. |
| $\begin{aligned} & \overline{\mathrm{PCS5} / \mathrm{A} 1} \\ & \overline{\mathrm{PCS6} / \mathrm{A} 2} \end{aligned}$ | 0 |  | $\begin{gathered} \mathrm{H}(1) / \mathrm{H}(\mathrm{X}) \\ \mathrm{R}(1) \\ \mathrm{P}(1) \end{gathered}$ | These pins provide a multiplexed function. As additional Peripheral Chip Selects, they go active whenever the address of a memory or I/O bus cycle is within the address limitations by the user. They may also be programmed to provide latched Address A2:1 signals. |
| $\begin{aligned} & \text { TOOUT } \\ & \text { T1OUT } \end{aligned}$ | 0 |  | $\begin{aligned} & \hline H(Q) \\ & R(1) \\ & P(Q) \\ & \hline \end{aligned}$ | Timer OUTput pins can be programmed to provide a single clock or continuous waveform generation, depending on the timer mode selected. |
| TOIN <br> T1IN | 1 | $\begin{aligned} & A(L) \\ & A(E) \end{aligned}$ |  | Timer INput is used either as clock or control signals, depending on the timer mode selected. |
| $\begin{aligned} & \text { DRQ0 } \\ & \text { DRQ1 } \end{aligned}$ | 1 | A(L) |  | DMA ReQuest is asserted by an external request when it is prepared for a DMA transfer. |
| $\begin{aligned} & \text { INTO } \\ & \text { INT1/SELECT } \end{aligned}$ | 1 | A(E,L) |  | Maskable INTerrupt input will cause a vector to a specific Type interrupt routine. To allow interrupt expansion, INTO and/or INT1 can be used with INTA0 and INTA1 to interface with an external slave controller. INT1 becomes SELECT when the ICU is configured for Slave Mode. |
| INT2/INTAO <br> INT3//NTA1/IRQ | I/O | A(E,L) | $\begin{aligned} & H(1) \\ & R(Z) \\ & P(1) \end{aligned}$ | These pins provide multiplexed functions. As inputs, they provide a maskable INTerrupt that will cause the CPU to vector to a specific Type interrupt routine. As outputs, each is programmatically controlled to provide an INTerrupt Acknowledge handshake signal to allow interrupt expansion. INT3/INTA1 becomes IRQ when the ICU is configured for Slave Mode. |
| N.C. |  |  |  | No Connect. For compatibility with future products, do not connect to these pins. |

## NOTE:

Pin names in parentheses apply to the 80C188EA and 80L188EA.

## 80C186EA PINOUT

Tables 4 and 5 list the 80C186EA pin names with package location for the 68-pin Plastic Leaded Chip Carrier (PLCC) component. Figure 9 depicts the complete 80C186EA/80L186EA pinout (PLCC package) as viewed from the top side of the component (i.e., contacts facing down).

Tables 6 and 7 list the 80C186EA pin names with package location for the 80-pin Quad Flat Pack (EIAJ) component. Figure 6 depicts the complete

80C186EA/80C188EA (EIAJ QFP package) as viewed from the top side of the component (i.e., contacts facing down).

Tables 8 and 9 list the 80C186EA/80C188EA pin names with package location for the 80-pin Shrink Quad Flat Pack (SQFP) component. Figure 7 depicts the complete 80C186EA/80C188EA (SQFP) as viewed from the top side of the component (i.e., contacts facing down).

## PACKAGE THERMAL SPECIFICATIONS

The 80C186EA/80L186EA is specified for operation when $\mathrm{T}_{\mathrm{C}}$ (the case temperature) is within the range of $0^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ (PLCC package) or $0^{\circ} \mathrm{C}$ to $106^{\circ} \mathrm{C}$ (QFP-EIAJ) package. $T_{C}$ may be measured in any environment to determine whether the processor is within the specified operating range. The case temperature must be measured at the center of the top surface.
$\mathrm{T}_{\mathrm{A}}$ (the ambient temperature) can be calculated from $\theta_{\mathrm{CA}}$ (thermal resistance from the case to ambient) with the following equation:

$$
\mathrm{T}_{\mathrm{A}}=\mathrm{T}_{\mathrm{C}}-\mathrm{P} \times \theta_{\mathrm{CA}}
$$

Typical values for $\theta_{\mathrm{CA}}$ at various airflows are given in Table 10.
$P$ (the maximum power consumption, specified in watts) is calculated by using the maximum ICC as tabulated in the DC specifications and $\mathrm{V}_{\mathrm{CC}}$ of 5.5 V .

## Recommended Connections

Power and ground connections must be made to multiple $V_{\text {CC }}$ and $V_{\text {SS }}$ pins. Every 80C186EA based circuit board should contain separate power ( $\mathrm{V}_{\mathrm{CC}}$ ) and ground ( $\mathrm{V}_{\mathrm{SS}}$ ) planes. All $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\mathrm{SS}}$ pins must be connected to the appropriate plane. Pins identified as "N.C." must not be connected in the system. Decoupling capacitors should be placed near the processor. The value and type of decoupling capac-

NOTICE: This data sheet contains preliminary information on new products in production. It is valid for the devices indicated in the revision history. The specifications are subject to change without notice.
*WARNING: Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.
itors is application and board layout dependent. The processor can cause transient power surges when its output buffers transition, particularly when connected to large capacitive loads.

Always connect any unused input pins to an appropriate signal level. In particular, unused interrupt pins (NMI, INT3:0) should be connected to $\mathrm{V}_{\text {SS }}$ to avoid unwanted interrupts. Leave any unused output pin or any "N.C." pin unconnected.

NOTES:

1. $\overline{\mathrm{RD}} / \overline{\mathrm{QSMD}}, \overline{\mathrm{UCS}}, \overline{\mathrm{LCS}}, \overline{\mathrm{MCSO}}, \overline{\mathrm{MCS}}, \overline{\mathrm{LOCK}}$ and $\overline{\mathrm{TEST}}$ have internal pullups that are only activated during RESET. Loading these pins above $\mathrm{l}_{\mathrm{OL}}=-275 \mu \mathrm{~A}$ will cause the processor to enter alternate modes of operation.
2. Output pins are floated using HOLD or ONCE Mode.
3. Measured at worst case temperature and $V_{C C}$ with all outputs loaded as specified in the $A C$ Test Conditions, and with the device in RESET ( $\overline{R E S I N}$ held low).
4. Output capacitance is the capacitive load of a floating output pin.

## Icc VERSUS FREQUENCY AND VOLTAGE

The current ( $I_{\mathrm{CC}}$ ) consumption of the processor is essentially composed of two components; IPD and Iccs.
$I_{P D}$ is the quiescent current that represents internal device leakage, and is measured with all inputs or floating outputs at GND or $\mathrm{V}_{\mathrm{CC}}$ (no clock applied to the device). IPD is equal to the Powerdown current and is typically less than $50 \mu \mathrm{~A}$.

ICCS is the switching current used to charge and discharge parasitic device capacitance when changing logic levels. Since ICCS is typically much greater than $I_{P D}$, $I_{P D}$ can often be ignored when calculating ICC.

ICCS is related to the voltage and frequency at which the device is operating. It is given by the formula:

$$
\begin{aligned}
& \text { Power }=\mathrm{V} \times \mathrm{I}=\mathrm{V}^{2} \times \mathrm{C}_{\mathrm{DEV}} \times \mathrm{f} \\
& \therefore \mathrm{I}=\mathrm{I}_{\mathrm{CC}}=\mathrm{I}_{\mathrm{CCS}}=\mathrm{V} \times \mathrm{C}_{\mathrm{DEV}} \times \mathrm{f}
\end{aligned}
$$

Where: $\mathrm{V}=$ Device operating voltage $\left(\mathrm{V}_{\mathrm{CC}}\right)$ $C_{\text {DEV }}=$ Device capacitance $\mathrm{f}=$ Device operating frequency $I_{C C S}=I_{C C}=$ Device current

Measuring $C_{D E V}$ on a device like the 80C186EA would be difficult. Instead, $\mathrm{C}_{\text {DEV }}$ is calculated using the above formula by measuring $\mathrm{I}_{\mathrm{CC}}$ at a known $\mathrm{V}_{\mathrm{CC}}$ and frequency (see Table 11). Using this $\mathrm{C}_{\text {DEV }}$ value, $l_{\text {CC }}$ can be calculated at any voltage and frequency within the specified operating range.

EXAMPLE: Calculate the typical ICC when operating at $20 \mathrm{MHz}, 4.8 \mathrm{~V}$.

## PDTMR PIN DELAY CALCULATION

The PDTMR pin provides a delay between the assertion of NMI and the enabling of the internal clocks when exiting Powerdown. A delay is required only when using the on-chip oscillator to allow the crystal or resonator circuit time to stabilize.

## NOTE:

The PDTMR pin function does not apply when $\overline{\text { RESIN }}$ is asserted (i.e., a device reset during Powerdown is similar to a cold reset and RESIN must remain active until after the oscillator has stabilized).

To calculate the value of capacitor required to provide a desired delay, use the equation:

$$
440 \times \mathrm{t}=\mathrm{C}_{\mathrm{PD}} \quad\left(5 \mathrm{~V}, 25^{\circ} \mathrm{C}\right)
$$

Where: $t=$ desired delay in seconds

$$
\begin{aligned}
\mathrm{C}_{\mathrm{PD}}= & \text { capacitive load on PDTMR in mi- } \\
& \text { crofarads }
\end{aligned}
$$

EXAMPLE: To get a delay of $300 \mu \mathrm{~s}$, a capacitor value of $\mathrm{C}_{\mathrm{PD}}=440 \times\left(300 \times 10^{-6}\right)=0.132 \mu \mathrm{~F}$ is required. Round up to standard (available) capacitive values.

NOTE:
The above equation applies to delay times greater than $10 \mu \mathrm{~s}$ and will compute the TYPICAL capacitance needed to achieve the desired delay. A delay variance of $+50 \%$ or $-25 \%$ can occur due to temperature, voltage, and device process extremes. In general, higher $\mathrm{V}_{\mathrm{CC}}$ and/or lower temperature will decrease delay time, while lower $\mathrm{V}_{\mathrm{CC}}$ and/or higher temperature will increase delay time.

$$
\mathrm{I}_{\mathrm{CC}}=\mathrm{I}_{\mathrm{CCS}}=4.8 \times 0.515 \times 20 \approx 49 \mathrm{~mA}
$$

Table 11. C ${ }_{\text {DEV }}$ Values

| Parameter | Typ | Max | Units | Notes |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{C}_{\text {DEV }}$ (Device in Reset) | 0.515 | 0.905 | $\mathrm{~mA} / \mathrm{V} * \mathrm{MHz}$ | 1,2 |
| $\mathrm{C}_{\text {DEV }}$ (Device in Idle) | 0.391 | 0.635 | $\mathrm{~mA} / \mathrm{V} * \mathrm{MHz}$ | 1,2 |

1. Max $C_{D E V}$ is calculated at $-40^{\circ} \mathrm{C}$, all floating outputs driven to $\mathrm{V}_{\mathrm{CC}}$ or GND, and all outputs loaded to 50 pF (including CLKOUT and OSCOUT).
2. Typical $\mathrm{C}_{\text {DEV }}$ is calculated at $25^{\circ} \mathrm{C}$ with all outputs loaded to 50 pF except CLKOUT and OSCOUT, which are not loaded.

## NOTES:

1. See AC Timing Waveforms, for waveforms and definition.
2. Measured at $\mathrm{V}_{\mathrm{IH}}$ for high time, $\mathrm{V}_{\mathrm{IL}}$ for low time.
3. Only required to guarantee $\mathrm{I}_{\mathrm{CC}}$. Maximum limits are bounded by $\mathrm{T}_{\mathrm{C}}, \mathrm{T}_{\mathrm{CH}}$ and $\mathrm{T}_{\mathrm{CL}}$. 4. Specified for a 50 pF load, see Figure 13 for capacitive derating information.
4. Specified for a 50 pF load, see Figure 14 for rise and fall times outside 50 pF .
5. See Figure 14 for rise and fall times.
6. $\mathrm{T}_{\mathrm{CHOV}}^{1}$ applies to $\overline{\mathrm{BHE}}$ ( $\overline{\mathrm{RFSH}}$ ), $\overline{\mathrm{LOCK}}$ and A19:16 only after a HOLD release.
7. TCHOV2 applies to $\overline{\mathrm{RD}}$ and $\overline{\mathrm{WR}}$ only after a HOLD release.

9 . Setup and Hold are required to guarantee recognition.
10. Setup and Hold are required for proper operation.
11. TCHOVs applies to $\overline{\mathrm{BHE}}$ ( $\overline{\mathrm{RFSH}}$ ) and A19:16 only after a HOLD release.
12. Operating conditions for 25 MHz are $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V} \pm 10 \%$,

Pin names in parentheses apply to the 80C188EA/80L188EA.

## NOTES:

1. Assumes equal loading on both pins.
2. Can be extended using wait states.
3. Not tested.
4. Not applicable to latched A2:1. These signals change only on falling $T_{1}$.
5. For write cycle followed by read cycle.
6. Operating conditions for 25 MHz are $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V} \pm 10 \%$.

## AC TEST CONDITIONS

The AC specifications are tested with the 50 pF load shown in Figure 8. See the Derating Curves section to see how timings vary with load capacitance.

Specifications are measured at the $\mathrm{V}_{\mathrm{CC}} / 2$ crossing point, unless otherwise specified. See AC Timing Waveforms, for AC specification definitions, test pins, and illustrations.

## AC TIMING WAVEFORMS

## DERATING CURVES

Figure 13. Typical Output Delay Variations Versus Load Capacitance

## RESET

The processor performs a reset operation any time the RESIN pin is active. The RESIN pin is actually synchronized before it is presented internally, which means that the clock must be operating before a reset can take effect. From a power-on state, RESIN must be held active (low) in order to guarantee correct initialization of the processor. Failure to provide RESIN while the device is powering up will result in unspecified operation of the device.

Figure 15 shows the correct reset sequence when first applying power to the processor. An external clock connected to CLKIN must not exceed the $\mathrm{V}_{\mathrm{CC}}$ threshold being applied to the processor. This is normally not a problem if the clock driver is supplied with the same $\mathrm{V}_{\mathrm{CC}}$ that supplies the processor. When attaching a crystal to the device, RESIN must remain active until both $\mathrm{V}_{\mathrm{CC}}$ and CLKOUT are stable (the length of time is application specific and depends on the startup characteristics of the crystal circuit). The RESIN pin is designed to operate correctly using an RC reset circuit, but the designer

Figure 14. Typical Rise and Fall Variations Versus Load Capacitance
must ensure that the ramp time for $\mathrm{V}_{\mathrm{CC}}$ is not so long that $\overline{\text { RESIN }}$ is never really sampled at a logic low level when $V_{C C}$ reaches minimum operating conditions.

Figure 16 shows the timing sequence when RESIN is applied after $\mathrm{V}_{\mathrm{CC}}$ is stable and the device has been operating. Note that a reset will terminate all activity and return the processor to a known operating state. Any bus operation that is in progress at the time RESIN is asserted will terminate immediately (note that most control signals will be driven to their inactive state first before floating).

While $\overline{\mathrm{RESIN}}$ is active, signals $\overline{\mathrm{RD}} / \overline{\mathrm{QSMD}}, \overline{\mathrm{UCS}}$, LCS, MCSO/PEREQ, MCS1/ERROR, LOCK, and TEST/BUSY are configured as inputs and weakly held high by internal pullup transistors. Forcing UCS and $\overline{\text { LCS }}$ low selects ONCE Mode. Forcing QSMD low selects Queue Status Mode. Forcing TEST/ BUSY high at reset and low four clocks later enables Numerics Mode. Forcing LOCK low is prohibited and results in unspecified operation.

Figure 15. Powerup Reset Waveforms
inted.

Figure 16. Warm Reset Waveforms

## BUS CYCLE WAVEFORMS

Figures 17 through 23 present the various bus cycles that are generated by the processor. What is shown in the figure is the relationship of the various bus signals to CLKOUT. These figures along with the information present in AC Specifications allow the user to determine all the critical timing analysis needed for a given application.

## 80C186EA/80C188EA EXECUTION TIMINGS

A determination of program exeuction timing must consider the bus cycles necessary to prefetch instructions as well as the number of execution unit cycles necessary to execute instructions. The following instruction timings represent the minimum execution time in clock cycle for each instruction. The timings given are based on the following assumptions:

- The opcode, along with any data or displacement required for execution of a particular instruction, has been prefetched and resides in the queue at the time it is needed.
- No wait states or bus HOLDs occur.
- All word-data is located on even-address boundaries. (80C186EA only)

All jumps and calls include the time required to fetch the opcode of the next instruction at the destination address.

All instructions which involve memory accesses can require one or two additional clocks above the minimum timings shown due to the asynchronous handshake between the bus interface unit (BIU) and execution unit.

With a 16-bit BIU, the 80C186EA has sufficient bus performance to endure that an adequate number of prefetched bytes will reside in the queue ( 6 bytes) most of the time. Therefore, actual program exeuction time will not be substanially greater than that derived from adding the instruction timings shown.

The 80C188EA 8-bit BIU is limited in its performance relative to the execution unit. A sufficient number of prefetched bytes may not reside in the prefetch queue ( 4 bytes) much of the time. Therefore, actual program execution time will be substantially greater than that derived from adding the instruction timings shown.

| LOCK $=$ Bus lock prefix | 11110000 |  | 2 | 2 |  |
| NOP $=$ No Operation | 10010000 |  | 3 | 3 |  |
|  | (TTT LLL are op | r extension) |  |  |  |

Shaded areas indicate instructions not available in 8086/8088 microsystems.

## NOTE:

*Clock cycles shown for byte transfers. For word operations, add 4 clock cycles for all memory transfers.

The Effective Address (EA) of the memory operand is computed according to the mod and r/m fields:

| od |  | 1 |
| :---: | :---: | :---: |
| if mod |  | 00 then DISP $=0$ *, disp-low and disp high are absent |
| if mod |  | 01 then DISP = disp-low sign-extended to 16 -bits, disp-high is absent |
| if mod |  | 10 then DISP = disp-high: disp-low |
| if $\mathrm{r} / \mathrm{m}$ | $=$ | 000 then EA $=(\mathrm{BX})+(\mathrm{SI})+$ DISP |
| if $\mathrm{r} / \mathrm{m}$ | = | 001 then EA $=(B X)+(D I)+$ DISP |
| if $\mathrm{r} / \mathrm{m}$ | = | 010 then EA $=(\mathrm{BP})+(\mathrm{SI})+$ DISP |
| if $\mathrm{r} / \mathrm{m}$ |  | 011 then EA $=(\mathrm{BP})+(\mathrm{DI})+$ DISP |
| if $\mathrm{r} / \mathrm{m}$ | = | 100 then EA $=(\mathrm{SI})+$ DISP |
| if $\mathrm{r} / \mathrm{m}$ |  | 101 then EA $=(\mathrm{DI})+$ DISP |
| if $\mathrm{r} / \mathrm{m}$ |  | 110 then EA $=(B P)+$ DISP* |
| if $\mathrm{r} / \mathrm{m}$ | = | 111 then EA $=(B X)+$ DISP |

DISP follows 2nd byte of instruction (before data if required)
*except if $\bmod =00$ and $\mathrm{r} / \mathrm{m}=110$ then $\mathrm{EA}=$ disp-high: disp-low.

EA calculation time is 4 clock cycles for all modes, and is included in the execution times given whenever appropriate.

Segment Override Prefix

| 0 | 0 | 1 | reg | 1 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

reg is assigned according to the following:
Segment
Register
reg Register
00 ES

CS
SS
DS

REG is assigned according to the following table:

| 16-Bit $(\mathbf{w}=\mathbf{1})$ | $\mathbf{8 - B i t}(\mathbf{w}=\mathbf{0})$ |
| :---: | :---: |
| 000 AX | 000 AL |
| 001 CX | 001 CL |
| 010 DX | 010 DL |
| 011 BX | 011 BL |
| 100 SP | 100 AH |
| 101 BP | 101 CH |
| 110 SI | 110 DH |
| 111 DI | 111 BH |

The physical addresses of all operands addressed by the BP register are computed using the SS segment register. The physical addresses of the destination operands of the string primitive operations (those addressed by the DI register) are computed using the ES segment, which may not be overridden.

## REVISION HISTORY

Intel 80C186EA/80L186EA devices are marked with a 9-character alphanumeric Intel FPO number underneath the product number. This data sheet update is valid for devices with an "A", "B", " $C$ ", " $D$ ", or "E" as the ninth character in the FPO number, as illustrated in Figure 5 for the 68-lead PLCC package, Figure 6 for the 84-lead QFP (EIAJ) package, and Figure 7 for the 80 -lead SQFP device. Such devices may also be identified by reading a value of 01 H , $02 \mathrm{H}, 03 \mathrm{H}$ from the STEPID register.

This data sheet replaces the following data sheets:

```
272019-002-80C186EA
272020-002-80C188EA
272021-002-80L186EA
272022-002-80L188EA
272307-001—SB80C186EA/SB80L186EA
272308-001—SB80C188EA/SB80L188EA
```

## ERRATA

An 80C186EA/80L186EA with a STEPID value of 01 H or 02 H has the following known errata. A device with a STEPID of 01 H or 02 H can be visually identified by noting the presence of an "A", "B", or "C" alpha character, next to the FPO number. The FPO number location is shown in Figures 5, 6, and 7.

1. An internal condition with the interrupt controller can cause no acknowledge cycle on the INTA1 line in response to INT1. This errata only occurs when Interrupt 1 is configured in cascade mode and a higher priority interrupt exists. This errata will not occur consistantly, it is dependent on interrupt timing.

An 80C186EA/80L186EA with a STEPID value of 03 H has no known errata. A device with a STEPID of 03 H can be visually identified by noting the presence of a "D" or "E" alpha character next to the FPO number. The FPO number location is shown in Figures 5,6 , and 7 .
