

PAL16L8A4CN

PAL16R8 Family

The PAL16RB Series offers the four most popular PAL device architectures. It also provides the fastest PAL devices in the Industry.

The PAL16RB Series consists of four devices, each with sixteen arriy Inputs and eight outputs. The devices have either 0, 4, 6, or 8 registered outputs, with the remaining being combinatorial.

The PAL device transfer function is the familiar Boolean sum of products. The PAL device consists of a programmable AND array driving a fixed OR array. Product terms with all bits programmed (disconnected) assume the logical high state, and product terms with both true and complement of any signal connected assume the logical low state.

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All re-creations are done with the approval of the Original Component Manufacturer (OCM).

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-35835
 - Class Q Military
 - Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)
 - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OCM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

FOR REFERENCE ONLY

PAL16R8 Family

16L8, 16R8 16R6, 16R4

Features/Benefits

- Standard 20-pin architectures
- TTL and CMOS versions
- High speed, as fast as 10 ns tPD for PAL16R8D Series
- Low power, as low as zero standby for PALC16R8Z Series
- Security fuse/cell on all devices

Description

The PAL16R8 Series offers the four most popular PAL device architectures. It also provides the fastest PAL devices in the industry.

The PAL16R8 Series consists of four devices, each with sixteen array inputs and eight outputs. The devices have either 0, 4, 6, or 8 registered outputs, with the remaining being combinatorial.

The PAL device transfer function is the familiar Boolean sum of products. The PAL device consists of a programmable AND array driving a fixed OR array. Product terms with all bits programmed (disconnected) assume the logical high state, and product terms with both true and complement of any signal connected assume the logical low state.

Variable Input/Output Pin Ratio

The registered devices in the series have eight dedicated input lines, and each combinatorial output is an I/O pin. The combinatorial device has ten dedicated input lines, and only six of the eight combinatorial outputs are I/O pins. Buffers for device inputs have complementary outputs to provide user-programmable input signal polarity. Unused input pins should be tied directly to VCC or GND.

Programmable Three-State Outputs

Each output has a three-state output buffer with programmable three-state control. On combinatorial outputs, a product term controls the buffer, allowing enable and disable to be a function of any combination of device inputs or output feedback. The output provides a bidirectional I/O pin in the combinatorial configuration, and may be configured as a dedicated input if the buffer is always disabled.

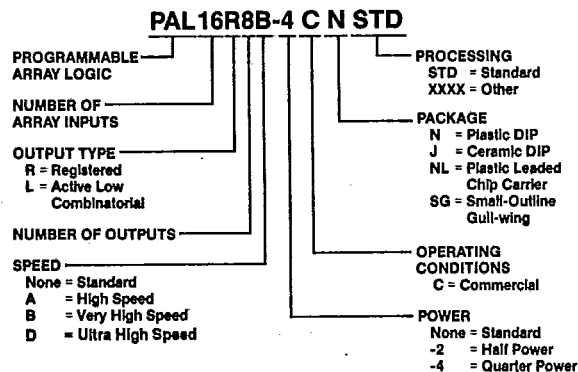

Registers with Feedback

Registered outputs are provided for data storage and synchronization. Registers are composed of D-type flip-flops which are loaded on the low-to-high transition of the clock input.

Ordering Information — Older Products

Packages

The commercial PAL16R8 Series is available in the plastic DIP (N), ceramic DIP (J), plastic leaded chip carrier (NL), and small outline (SG) packages. The CMOS versions are also available in windowed (Q) packages.

Polarity

All outputs are active low.

Performance

Several speed/power versions are available (see table). The D Series offers the fastest TTL programmable logic devices in the industry at 10 ns tPD.

Preload

The CMOS Series offers register preload for device testability. The register can be preloaded from outputs by using super-voltages in order to simplify functional testing.

		No feedback ($1/t_{wh} + t_{wp}$)			33.3	50		

Output Register Preload

The preload function allows the register to be loaded from the output pins. This feature aids functional testing of sequential designs by allowing direct loading of output states. The procedure is:

1. Raise VCC to 5.0 V \pm 0.5 V.
2. Disable output registers by setting pin 11 to VIH.
3. Apply VIL/VIH as desired to all registered output pins. Leave combinatorial outputs floating.
4. Pulse pin 5 from VIL to 13.5 V to VIL.
5. Remove VIL/VIH from all registered output pins.
6. Enable output registers.
7. Verify for VOL/VOH at all registered output pins.

Programming and Erasing

The PALC16R8Q-25 Series can be programmed on standard logic programmers. The PALC16R8Q-25 Series may be erased by ultraviolet light when contained in the windowed package.

For erasure, the recommended ultraviolet light wavelength is 2537 Angstroms. The minimum dose required is 25,000 mW-sec/cm² (UV intensity x exposure time). For an ultraviolet lamp with a 12 mW/cm² power rating, the minimum exposure time would be 25,000/12 seconds = 35 minutes. The device needs to be within one inch of the lamp during erasure.

Permanent damage may result if the device is exposed to high-intensity UV light for an extended period of time. The recommended maximum dosage is 7258 W-sec/cm².

Wavelengths of light less than 4000 Angstroms can partially erase the device in the windowed package. For this reason, an opaque label should be placed over the window, especially if the device will be exposed to sunlight or fluorescent lighting for extended periods of time.

V_{OH}	High-level output voltage	$V_{CC} = \text{MIN}$	$I_{OH} = -3.2 \text{ mA}$	2.4	2.8		V
I_{OZL}^2	Off-state output current	$V_{CC} = \text{MAX}$	$V_O = 0.4 \text{ V}$			-100	μA
I_{OZH}^2			$V_O = 2.4 \text{ V}$			100	μA
I_{OS}^3	Output short-circuit current	$V_{CC} = 5 \text{ V}$	$V_O = 0 \text{ V}$	-30	-70	-130	mA
I_{CC}	Supply current	$V_{CC} = \text{MAX}$			120	180	mA

1. These are absolute voltages with respect to the ground pin on the device and include all overshoots due to system and/or tester noise. Do not attempt to test these values without suitable equipment.
2. I/O pin leakage is the worst case of I_{IL} and I_{OZL} (or I_{IH} and I_{OZH}).
3. No more than one output should be shorted at a time, and duration of the short circuit should not exceed one second.
