Functional Description

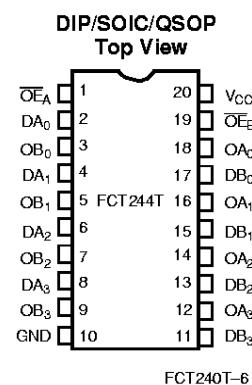

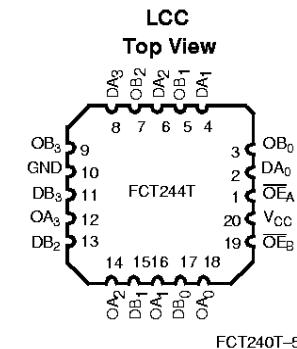

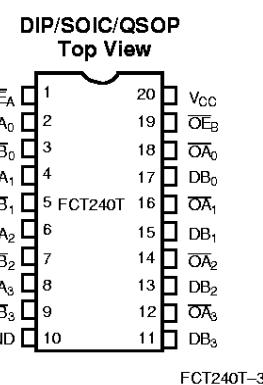

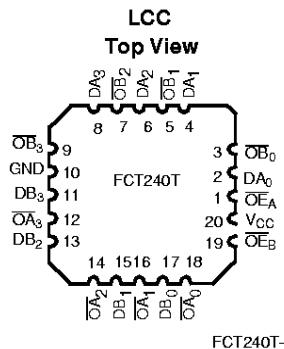

The FCT240T and FCT244T are octal buffers and line drivers designed to be employed as memory address drivers, clock drivers, and bus-oriented transmitters/receivers. The devices provide speed and drive capabilities equivalent to their fastest bipolar logic counterparts while reducing power consumption. The input and output voltage levels allow direct interface with TTL, NMOS, and CMOS devices without external components.

The outputs are designed with a power-off disable feature to allow for live insertion of boards.

Notes:

1. H = HIGH Voltage Level, L = LOW Voltage Level, X = Don't Care.
2. Unless otherwise noted, these limits are over the operating free-air temperature range.
3. Unused inputs must always be connected to an appropriate logic voltage level, preferably either V_{CC} or ground.
4. T_A is the "instant on" case temperature.
5. Typical values are at V_{CC}=5.0V, T_A=+25°C ambient.
6. This parameter is guaranteed but not tested.
7. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

Notes:

8. Per TTL driven input ($V_{IN}=3.4V$); all other inputs at V_{CC} or GND.
 9. This parameter is not directly testable, but is derived for use in Total Power Supply calculations.
 10. $I_C = I_{QUIESCENT} + I_{INPUTS} + I_{DYNAMIC}$
 $I_C = I_{CC} + \Delta I_{CC} D_H N_T + I_{CCD}(f_0/2 + f_1 N_1)$
 $I_{CC} = \text{Quiescent Current with CMOS input levels}$
 $\Delta I_{CC} = \text{Power Supply Current for a TTL HIGH input } (V_{IN}=3.4V)$
 $D_H = \text{Duty Cycle for TTL inputs HIGH}$
 $N_T = \text{Number of TTL inputs at } D_H$
 $I_{CCD} = \text{Dynamic Current caused by an input transition pair (HLH or LHL)}$
 $f_0 = \text{Clock frequency for registered devices, otherwise zero}$
 $f_1 = \text{Input signal frequency}$
 $N_1 = \text{Number of inputs changing at } f_1$
- All currents are in millamps and all frequencies are in megahertz.

11. Values for these conditions are examples of the I_{CC} formula. These limits are guaranteed but not tested.
