New Feature<br>Zero Amplitude Wiper Switching

## Low Noise, Low Cost, High End Features, Dual Audio Log Potentiometer

## X9460

## Dual Audio Control Digitally Controlled Potentiometer (XDCP ${ }^{\text {TM }}$ )

## FEATURES

- Dual audio control - Two 32 taps Log pots
- Zero Amplitude Wiper Switching
- 2-wire serial interface

4 cascadable slave byte addresses [A1,A0]

- Total resistance: $33 \mathrm{~K} \Omega$ each XDCP (Typical)
- Dual Voltage Operation
$\mathrm{V}+/ \mathrm{V}-= \pm 2.7$ to $\pm 5.5 \mathrm{~V}$
- Temp Range $=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- Package Options

14-Lead TSSOP

## AUDIO PERFORMANCE

- 0 to - 62dB volume control
- -92dB Mute
-Power up to mute position
- SNR -96dB
- THD+N: -95dB @1k HZ
- Crosstalk rejection: -102dB @ 1k HZ
- Channel-to-channel variation: $\pm 0.1 \mathrm{~dB}$
- 3dB-cutoff: 100kHz

## DESCRIPTION

The X9460 integrates two digitally controlled potentiometer (XDCP) on a monolithic CMOS integrated circuit. The two XDCPs can be used as stereo gain controls in audio applications. Read/Write operations can directly access each channel independently or both channels simultaneously. Increment/ Decrement can adjust each channel independently or both channels simultaneously.

The X9460 contains a zero amplitude wiper switching circuit that delays wiper changes until the next zero crossing of the audio signal.

The digitally controlled potentiometer is implemented using 31 polysilicon resistors in a log array. Between each of the resistors are tap points connected to the wiper terminal through switches. The XDCPs are designed to minimize wiper noise to avoid pops and clicks during audio volume transitions. The position of the wiper on the array is controlled by the user through the 2 -wire serial bus interface.

Power up reset the wiper to the mute position.

## DETAILED PIN DESCRIPTION:

## Host Interface Pins

## Serial Clock (SCL)

The SCL input clocks data into and out of the X9460.

## Serial Data (SDA)

SDA is a bidirectional pin used to transfer data into and out of the device. It is an open drain output and may be wire-ORed with any number of open drain or open collector outputs. An open drain output requires the use of a pull-up resistor. For selecting typical values, refer to the guidelines for calculating typical values on the bus pull-up resistors graph.

## Device Address ( $\mathrm{A}_{1}-\mathrm{A}_{\mathbf{0}}$ )

The Address inputs are used to set the least significant 2 bits of the 8 -bit Slave Byte Address. A match in the slave address serial data stream must be made with the Address input in order to initiate communication with the X9460. Up to 4 X9460s may be directly connected to a single I2C serial bus. If left floating, these pins are internally pulled to ground.
Slave Byte (bits, MSB-LSB) $=01010 \mathrm{~A}_{1} \mathrm{~A}_{0} \mathrm{R} / \mathrm{W}$

## Potentiometer Pins

$\mathbf{R}_{\mathrm{H}-\mathrm{LEFT}}, \mathbf{R}_{\mathrm{L}-\mathrm{LEFT}}, \mathbf{R}_{\mathrm{H} \text {-RIGHT }}, \mathbf{R}_{\mathrm{L} \text {-RIGHT }}$
The $R_{H}$ and $R_{L}$ inputs are equivalent to the terminal connections on either end of a mechanical potentiometer.

## $\mathbf{R}_{\text {W-Left }}, \mathbf{R}_{\text {W-right }}$

The wiper outputs are equivalent to the wiper output of a mechanical potentiometer.

## Supply Pins

## Analog Supply V-and $\mathbf{V}_{+}$

The positive power supply for the DCP analog control section is connected to $\mathrm{V}+$. The negative power supply for the DCP analog control section is connected to V -.

## Digital Supplies $\mathbf{V}_{\mathbf{C C}}, \mathbf{V}_{\mathbf{S S}}$

The power supplies for the digital control sections.

## Power Up and Down Recommendations

There are no restrictions on the power-up condition of $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}+$ and V - and the voltages applied to the potentiometer pins provided that the Vcc and V+ are more positive or equal to the voltage at RH, RL, and Rw, ie. Vcc, $\mathrm{V}_{+}>\mathrm{RH}, \mathrm{RL}$, Rw. At all times, the voltages on the potentiometer pins must be less than $\mathrm{V}+$ and more than V -.

The following $\mathrm{V}_{\mathrm{CC}}$ ramp rate spec is always in effect.

$$
0.2 \mathrm{~V} / \mathrm{ms}<\mathrm{V}_{\mathrm{CC}} \mathrm{ramp}<50 \mathrm{~V} / \mathrm{ms}
$$

The $V_{S S}$ pin is always connected to the system common or ground. $\mathrm{V}_{\mathrm{H}}, \mathrm{V}_{\mathrm{L}}, \mathrm{V}_{\mathrm{W}}$ are the voltages on the $\mathrm{R}_{\mathrm{H}}$, $R_{L}$, and $R_{W}$ potentiometer pins.

## X9460 PRINCIPLES OF OPERATION

The X9460 is a highly integrated microcircuit incorporating two resistor arrays with their associated registers, counters and the serial interface logic providing direct communication between the host and the DCP potentiometers. This section provides detailed description as following:

- Resistor Array Description
- Serial Interface Description
- Command Set and Register Information Description

## RESISTOR ARRAY DESCRIPTION

The X9460 is comprised of two resistor arrays. Each array contains 31 discrete resistive segments that are connected in series. The physical ends of each array are equivalent to the fixed terminals of a mechanical potentiometer ( $\mathrm{R}_{\mathrm{H}}$ and $\mathrm{R}_{\mathrm{L}}$ inputs). Tables 1 and 2 provide a description of the step size and tap positions.

At both ends of each array and between each resistor segment is a CMOS switch connected to the wiper ( $\mathrm{K}_{\mathrm{W}}$ ) output. Within each individual array only one switch may be turned on at a time. These switches are controlled by the Wiper Counter Register (WCR). The five bits of the WCR are decoded to select, and enable, one of thirty-two switches.
Table 1. Total -62dB range Plus Mute Position

| Step Size | \# of Steps |
| :---: | :---: |
| -1 dB | 11 steps |
| -2 dB | 10 steps |
| -3 dB | 5 steps |
| -4 dB | 4 steps |
| Mute | 1 step |

Table 2. Wiper Tap Position vs dB.

| Tap Position, $\mathbf{n}$ | $\mathbf{d B}$ | Min/Max dB |
| :---: | :---: | :---: |
| for $\mathrm{n}=20$ to 31 | $\mathrm{n}-31$ | $-11 / 0$ |
| for $\mathrm{n}=10$ to 19 | $2 \mathrm{n}-51$ | $-31 /-13$ |
| for $\mathrm{n}=5$ to 9 | $3 \mathrm{n}-61$ | $-46 /-34$ |
| for $\mathrm{n}=1$ to 4 | $4 \mathrm{n}-66$ | $-62 /-50$ |
| $\mathrm{n}=0$ | -92 | -92 |

## SERIAL INTERFACE DESCRIPTION

## Serial Interface

The X9460 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master will always initiate data transfers and provide the clock for both transmit and receive operations. The X9460 is a slave device in all applications.

## Clock and Data Conventions

Data states on the SDA line can change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions.

## Start Condition

All commands to the X9460 are preceded by the start condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The X9460 continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition is met.

## Stop Condition

All communications must be terminated by a stop condition, which is a LOW to HIGH transition of SDA while SCL is HIGH.

## Acknowledge

Acknowledge is a software convention used to provide a positive handshake between the master and slave devices on the bus to indicate the successful receipt of data. The transmitting device, either the master or the slave, will release the SDA bus after transmitting eight bits. The master generates a ninth clock cycle and during this period the receiver pulls the SDA line LOW to acknowledge that it successfully received the eight bits of data.

The X9460 will respond with an acknowledge: 1) after recognition of a start condition and after an identification and slave address byte, and 2) again after each successful receipt of the instruction or databyte. See Figure 1.

## Invalid Commands

For any invalid commands or unrecognizable addresses, the X9460 will NOT acknowledge and return the X9460 to the idle state.

Figure 1. Acknowledge Response from Receiver

## COMMAND SET AND REGISTER DESCRIPTION

## DEVICE ADDRESSING

Following a start condition the master must output the Slave Byte Address of the slave it is accessing. The most significant four bits of the slave address are the device type identifier (refer to Figure 2 below). For the X9460 this is fixed as 0101.

Figure 2. Slave Byte Address

The next three bits of the Slave Byte Address are the device address. The device address is defined by the $A_{1}-A_{0}$ inputs. The X9460 compares the serial data stream with the Slave Byte Address; a successful compare is required for the X 9460 to respond with an acknowledge. The $A_{1}-A_{0}$ inputs can be actively driven by CMOS input signals or tied to $\mathrm{V}_{\mathrm{CC}}$ or $\mathrm{V}_{\mathrm{SS}}$. The $\mathrm{R} / \overline{\mathrm{W}}$ bit sets the device for read or write operations.

## Command Set

After a Slave Byte Address match, the next byte sent contains the Command and register pointer information. The four most significant bits are the Command. The next bit is a " $X$ " (don't care) set to zero.

Figure 3. Command Byte Format

The $Z_{D}$ bit enables and disables the Zero Amplitude Wiper Switching circuit. When $Z_{D}=1$, the wiper switches will turn on when close-to-zero amplitude is detected across the potentiometer pins. When $Z_{D}=0$,
this circuit is disabled. The last two bits, LT (left POT enable) and RT (right POT enable), select which of the two potentiometers is affected by the instruction.

Several instructions require a three-byte sequence to complete. These instructions transfer data between the host and the X9460. These instructions are: Read Wiper Counter Register, Write Wiper Counter Register. The sequence of operations is shown in Figure 4 and 5. The four-byte command is used for write command for both right and left pots (Figure 6).

## Special Commands

Increment / Decrement Instruction. The Increment/ Decrement command is different from the other commands. Once the command is issued and the X9460 has responded with an acknowledge, the master can clock the selected wiper up and/or down. For each SCL clock pulse ( $t_{H I G H}$ ) while SDA is HIGH, the selected wiper will move one resistor segment towards the $R_{H}$ terminal. Similarly, for each SCL clock pulse while SDA is LOW, the selected wiper will move one resistor segment towards the $R_{L}$ terminal. A detailed illustration of the sequence and timing for this operation are shown in Figures 7 and 8 respectively.

## Wiper Counter Register

The X9460 contains two Wiper Counter Registers. The Wiper Counter Register output is decoded to select one of thirty-two switches along its resistor array. The Write Wiper Counter Register command directly sets the WCR to a value. The Increment/Decrement instruction steps the register value up or down one to multiple times.

The WCR is a volatile register (Table 3) and is reset to the mute position (tap 0, "zero") at power-up.

Table 3. Wiper Counter Registers, 5-bit - volatile:

| WCR4 | WCR3 | WCR2 | WCR1 | WCR0 |
| :---: | :---: | :---: | :---: | :---: |
| (MSB) |  |  |  |  |

The X9460 contains one 5-bit Wiper Counter Register for each DCP. (Two 5-bit registers in total.)

Table 2a. Command Set

| Instruction | Instruction Set |  |  |  |  |  |  |  | Operation |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{I}_{3}$ | $\mathrm{I}_{2}$ | $\mathrm{I}_{1}$ | $\mathrm{I}_{0}$ | X | $\mathrm{Z}_{\mathrm{D}}$ | RT | LT |  |
| Read Wiper |  |  |  |  |  |  |  |  | LSB of Slave Byte=1, no command required Slave will return Left then Right Data |
| Write Left Wiper Counter | 1 | 0 | 1 | 0 | 0 | 1/0 | 0 | 1 | Write new value to the Wiper Counter Register |
| Write Right Wiper Counter | 1 | 0 | 1 | 0 | 0 | 1/0 | 1 | 0 | Write new value to the Wiper Counter Register |
| Write Both Wiper Counters | 1 | 0 | 1 | 0 | 0 | 1/0 | 1 | 1 | Write new value to the Wiper Counter Register |
|  |  |  |  |  |  |  |  |  |  |
| Inc/Dec Left Wiper Counter | 0 | 0 | 1 | 0 | 0 | 1/0 | 0 | 1 | Enable Increment/decrement of the Control Latch |
| Inc/Dec Right Wiper Counter | 0 | 0 | 1 | 0 | 0 | 1/0 | 1 | 0 | Enable Increment/decrement of the Control Latch |
| Inc/Dec Both Wiper Counters | 0 | 0 | 1 | 0 | 0 | 1/0 | 1 | 1 | Enable Increment/decrement of the Control Latch |

Notes: " $1 / 0$ " = data is one or zero

## LIMITED WARRANTY

Devices sold by Xicor, Inc. are covered by the warranty and patent indemnification provisions appearing in its Terms of Sale only. Xicor, Inc. makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. Xicor, Inc. makes no warranty of merchantability or fitness for any purpose. Xicor, Inc. reserves the right to discontinue production and change specifications and prices at any time and without notice.

Xicor, Inc. assumes no responsibility for the use of any circuitry other than circuitry embodied in a Xicor, Inc. product. No other circuits, patents, or licenses are implied.

## TRADEMARK DISCLAIMER:

Xicor and the Xicor logo are registered trademarks of Xicor, Inc. AutoStore, Direct Write, Block Lock, SerialFlash, MPS, and XDCP are also trademarks of Xicor, Inc. All others belong to their respective owners.

## U.S. PATENTS

Xicor products are covered by one or more of the following U.S. Patents: 4,326,134; 4,393,481; 4,404,475; 4,450,402; 4,486,769; 4,488,060; 4,520,461; 4,533,846; 4,599,706; 4,617,652; 4,668,932; 4,752,912; 4,829,482; 4,874,967; 4,883,976; 4,980,859; 5,012,132; 5,003,197; 5,023,694; 5,084,667; 5,153,880; 5,153,691; $5,161,137 ; 5,219,774 ; 5,270,927 ; 5,324,676 ; 5,434,396 ; 5,544,103 ; 5,587,573 ; 5,835,409 ; 5,977,585$. Foreign patents and additional patents pending.

## LIFE RELATED POLICY

In situations where semiconductor component failure may endanger life, system designers using this product should design the system with appropriate error detection and correction, redundancy and back-up features to prevent such an occurrence.
Xicor's products are not authorized for use in critical components in life support devices or systems.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
