

## DRV3202-Q1 3-Phase Brushless Motor Driver

*Not Recommended for New Designs*

### 1 Features

- 3-Phase Pre-drivers for N-channel MOS Field Effect Transistors (MOSFETs)
- Pulse Width Modulation (PWM) Frequency up to 20 kHz
- Fault Diagnostics
- Charge Pump
- Phase Comparators
- Phase Monitoring Sample and Hold Op-Amps
- Central Processing Unit (CPU) Reset Generator
- Serial Port I/F (SPI)
- Motor Current Sense
- 80-pin HTQFP
- Controller Area Network (CAN)
- 5-V Regulator

### 2 Applications

Automotive

### 3 Description

The DRV3202-Q1 device is a field effect transistor (FET) pre-driver designed for 3-phase motor control and its application such as an oil pump or a water pump. It is equipped with three high-side pre-FET drivers and three low-side drivers which are controlled by an external microcontroller (MCU). The power for the high side is supplied by a charge pump and no bootstrap cap is needed. For commutation, this integrated circuit (IC) sends a conditional motor drive signal and output to the MCU. Diagnostics provide undervoltage, overvoltage, overcurrent, overtemperature and power bridge faults. The motor current can be measured using an integrated current sense amplifier and comparator in a battery common-mode range, which allows the motor current to be used in a high-side current sense application. Gain is attained by external resistors. If the MCU does not have enough bandwidth, the phase monitoring sample and hold amplifiers can hold phase information until the MCU is ready to process it. The interfaces include SPI and CAN. The pre-driver and other internal settings can be configured through the SPI. The CAN is used to communicate with other electronic control units (ECUs).

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV3202-Q1	HTQFP (80)	12.00 mm x 12.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision history

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (December 2012) to Revision B	Page
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	1
• Changed device status to NRND .....	1

Changes from Original (October, 2012) to Revision A	Page
• Changed max rating for PHTM, PH1M, PH2M, and PH3M from -2 –40 V to -1–40 V. ....	4
• Changed O to IO for pin 44 and 45. ....	5
• Deleted Table 1 Pin Equivalent Circuits. ....	6
• Changed VCANH and VCANL to VCAN_H and VCAN_L in CAN receiver section .....	7
• Added 3 new parameters to VCC and VDD Electrical Characteristics table. Changed min, typ, and max values VLRVCC, CVCC, TVCC1, TVCC2, VDDOV, TVDD. Added table note. ....	8
• Changed VCANH and VCANL to VCAN_H and VCAN_L in CAN AC characteristic section. ....	8
• Changed CANH_D to VCANH_D, CANL_D to VCANL_D, and VCANH - VCANL to VCAN_H - VCAN_L in CAN timing chart. ....	8
• Changed $V_{chv1\_12}$ to $V_{chv1\_1}$ , $V_{chv1\_20}$ to $V_{chv1\_2}$ , $V_{chv2\_12}$ to $V_{chv2\_1}$ , $V_{chv2\_20}$ to $V_{chv2\_2}$ , $V_{chv3\_12}$ to $V_{chv3\_1}$ , $V_{chv3\_20}$ to $V_{chv3\_2}$ .....	9
• Added min and typ values to $V_{chvmax}$ parameter. ....	9
• Changed min, typ and max values for $V_{chv1\_0}$ through $V_{chv3\_2}$ ; changed typ $R_{on}$ value from 10 to 8. ....	9
• Removed $R_{ONH\_H}$ row, removed cross-references from $R_{ONH\_HP}$ and $R_{ONH\_HN}$ , added conditions to $R_{ONH\_HP}$ and $R_{ONH\_HN}$ ; changed typ and max values for $R_{ONH\_HN}$ .....	9
• Removed "side" from $V_{OH\_L}$ and $V_{OL\_L}$ description, changed high side and low side to pull up and pull down respectively for $R_{ONH\_L}$ and $R_{ONL\_L}$ . Changed values for $R_{ONL\_L}$ from 10 typ to 7 typ and from 20 max to 14 max in pre-driver electrical characteristics table. ....	9
• Changed Turn-off time from $T_{off\_h}$ to $T_{off\_l}$ .....	9
• Changed min value for $V_{inm}$ from -2 to -1. ....	10
• Added $C1 = 4.7$ pF to $T_{set\_TR1}$ , $T_{set\_TR2}$ , $T_{set\_TF1}$ , and $T_{set\_TF2}$ conditions in motor current sense electrical characteristics ...	10
• Changed max current limit from 500 to 550. ....	12
• Added typ and max values to VB monitor electrical characteristics table .....	12
• Changed max $I_{VB}$ from 40 to 35 mA. ....	12
• Changed ICANH to IA_CANH and ICANL to IA_CANL in CAN testing condition image .....	14

- Changed CANTX to CAN\_TX and CANH and CANL to CAN\_H and CAN\_L in CAN reset function image. .... 15
- Changed CANH and CANL to CAN\_H and CAN\_L in description section; changed CANH, CANL, and CANM to CAN\_H, CAN\_L, and CAN\_M in block diagram. .... 22
- Changed charge pump description..... 22
- Changed pre-driver description and updated block diagram..... 23
- Updated phase comparator description. .... 24
- Changed motor current sense description and motor current sense block diagram..... 25
- Updated Sample and Hold Mode Block Diagram..... 25
- Changed V<sub>CC</sub> Block Diagram..... 27
- Changed VB Monitor description..... 28
- Changed thermal shutdown description. .... 29
- Changed location of EN in Figure 34. .... 30
- Changed MCU RESET column to  $\overline{\text{RES}}$  column; changed values..... 31

DRV3202-Q1

## 7 Detailed Description

### 7.1 Functional Block Diagram

## 7.2 Feature Description

### 7.2.1 Watchdog

The watchdog monitors the PRN signal and  $V_{CC}$  supply level and generates a reset to the MCU through the  $\overline{RES}$  pin if the status of the PRN is not normal or the  $V_{CC}$  is lower than the specified threshold level. The watchdog can be disabled if WIDEN is set high.

Feature Description (continued)

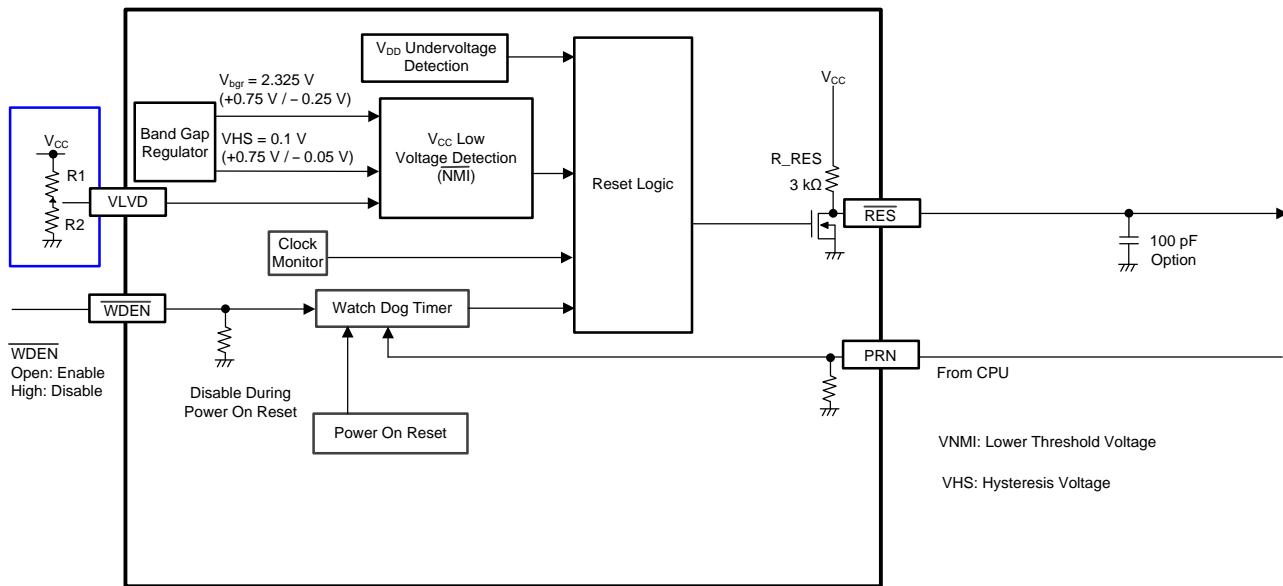

Figure 14. Watchdog Block Diagram

7.2.2 Serial Port I/F

The SPI is used to receive an input byte from CPU and to transmit an output byte to CPU. Four signals are utilized according to the timing chart of Figure 15.

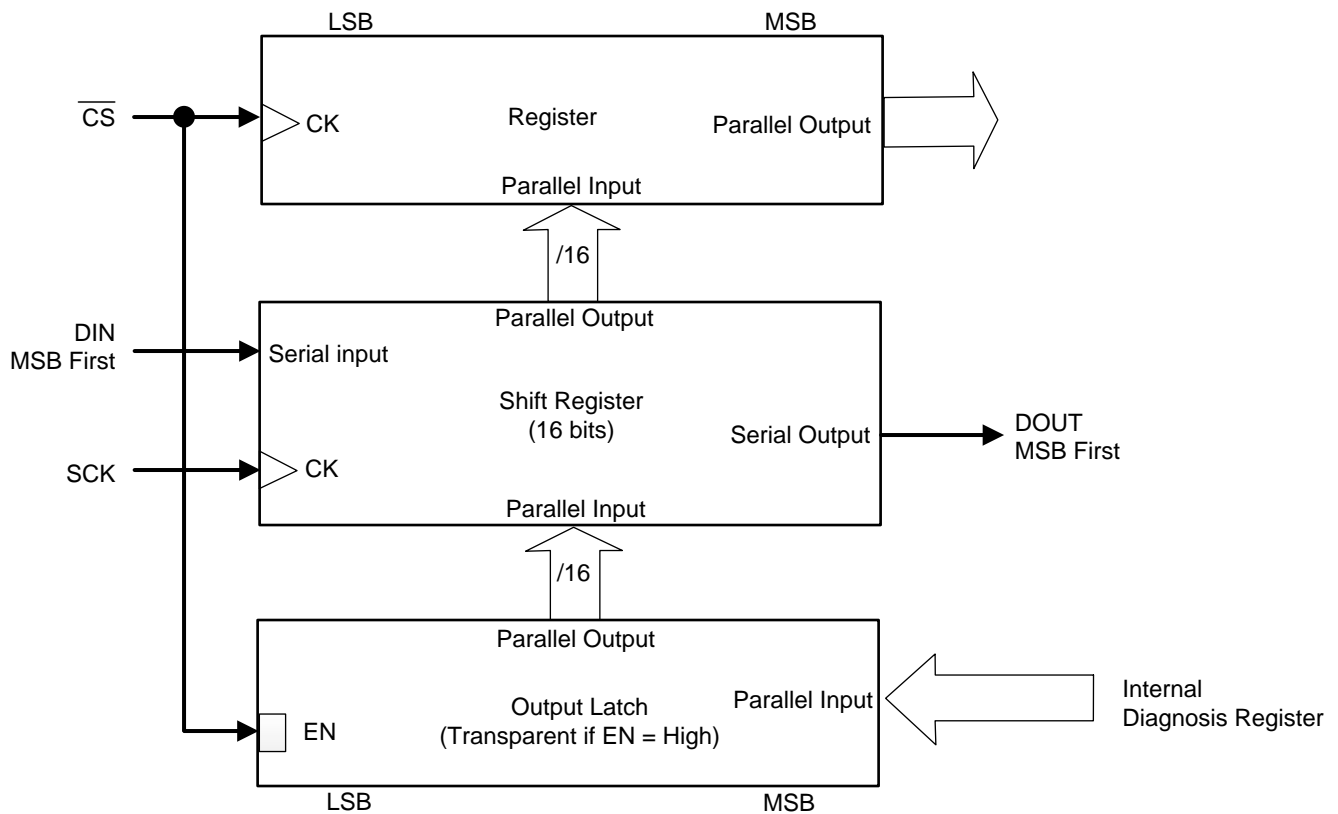

Figure 15. Block Diagram of SPI

**Feature Description (continued)**

- **$\overline{\text{CS}}$  – Chip Select**
  - This input signal is utilized to select this IC by CPU.
  - This input signal is normally high and the communication is possible only when it is forced low.
  - When this input signal falls, the communication between this IC and the CPU starts.
  - Transmitted data is latched and the DOUT pin comes out of high impedance.
  - When this input signal rises, the communication stops.
  - The DOUT pin goes into high impedance. Then, the internal input register updates with the received bits (only if the clock pulse numbers are right and the key bit of the DIN signals is correct).
  - The next falling edge starts another communication.
  - There is a minimum waiting time between two communications ( $T_{\text{wait}}$ ).
  - The pin has an internal pullup.
- **SCK – Synchronization Serial Clock**
  - This input signal is utilized to synchronize the communication by CPU.
  - It is normally high and the correct clock pulse number is 16.
  - At each falling edge, the CPU writes a new bit on the DIN input and this IC writes a new bit on the DOUT pin. At each rising edge, this IC reads the new bit on the DIN pin and the CPU reads the new bit on the DOUT pin.
  - The maximum clock frequency is 4 MHz.
  - The pin has an internal pullup.
- **DIN – Serial Input Data**
  - This input signal is used to receive 16-bit data.
  - The bits are received in order from the MSB (first) to the LSB (last).
  - The pin has an internal pullup.
- **DOUT – Serial Output Data**
  - This output signal is used to transmit 16-bit data.
  - It is a 3-state output and it is in high impedance mode when  $\overline{\text{CS}}$  is high.
  - The serial data bits are transmitted in order from the MSB (first) to the LSB (last).

## Feature Description (continued)

### 7.2.3 CAN

The CAN data from CAN control logic is transmitted to other systems through the CAN bus. The receiver compares the CAN\_H–CAN\_L voltage levels against an internally generated reference and the result is output through CAN\_TX. It has overcurrent protection, shown in [Figure 6](#).

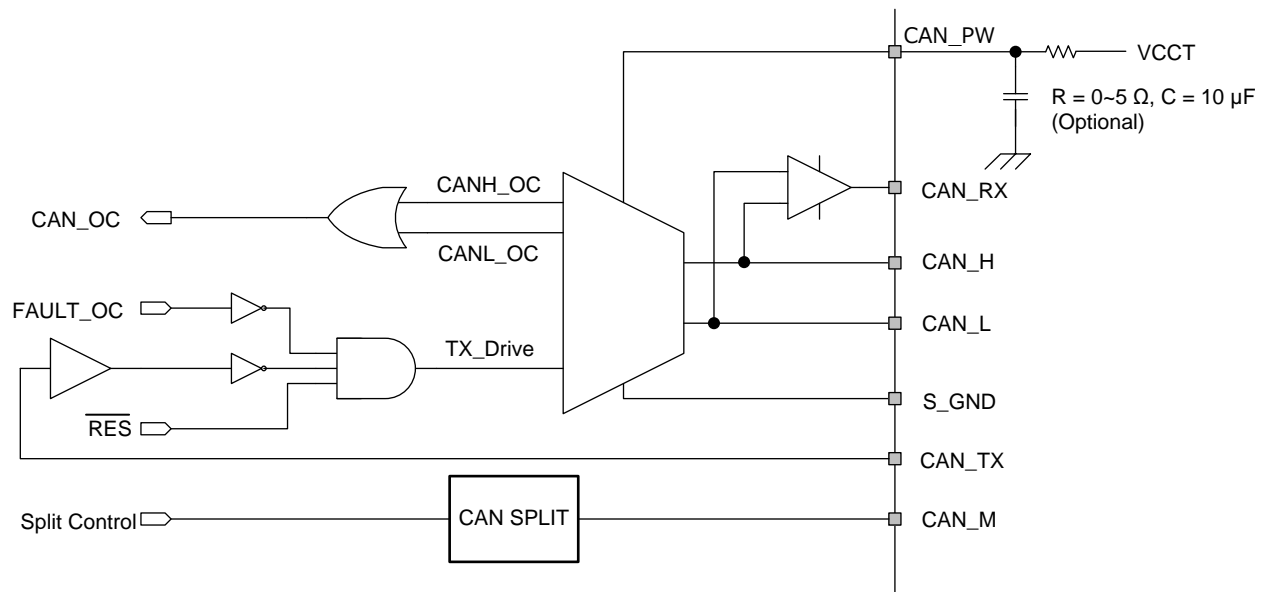

Figure 16. CAN Block Diagram

### 7.2.4 Charge Pump

The charge pump block generates the supply for high-side and low-side pre-drivers to maintain the gate voltage on the external FETs. External storage cap (CCP) and bucket caps (C1, C2) are used to support pre-driver slope and switching frequency requirements. R1 and R2 can reduce switching current if required. The charge pump has a voltage supervisor for over and undervoltage, and a selectable stop condition for pre-drivers.

Feature Description (continued)

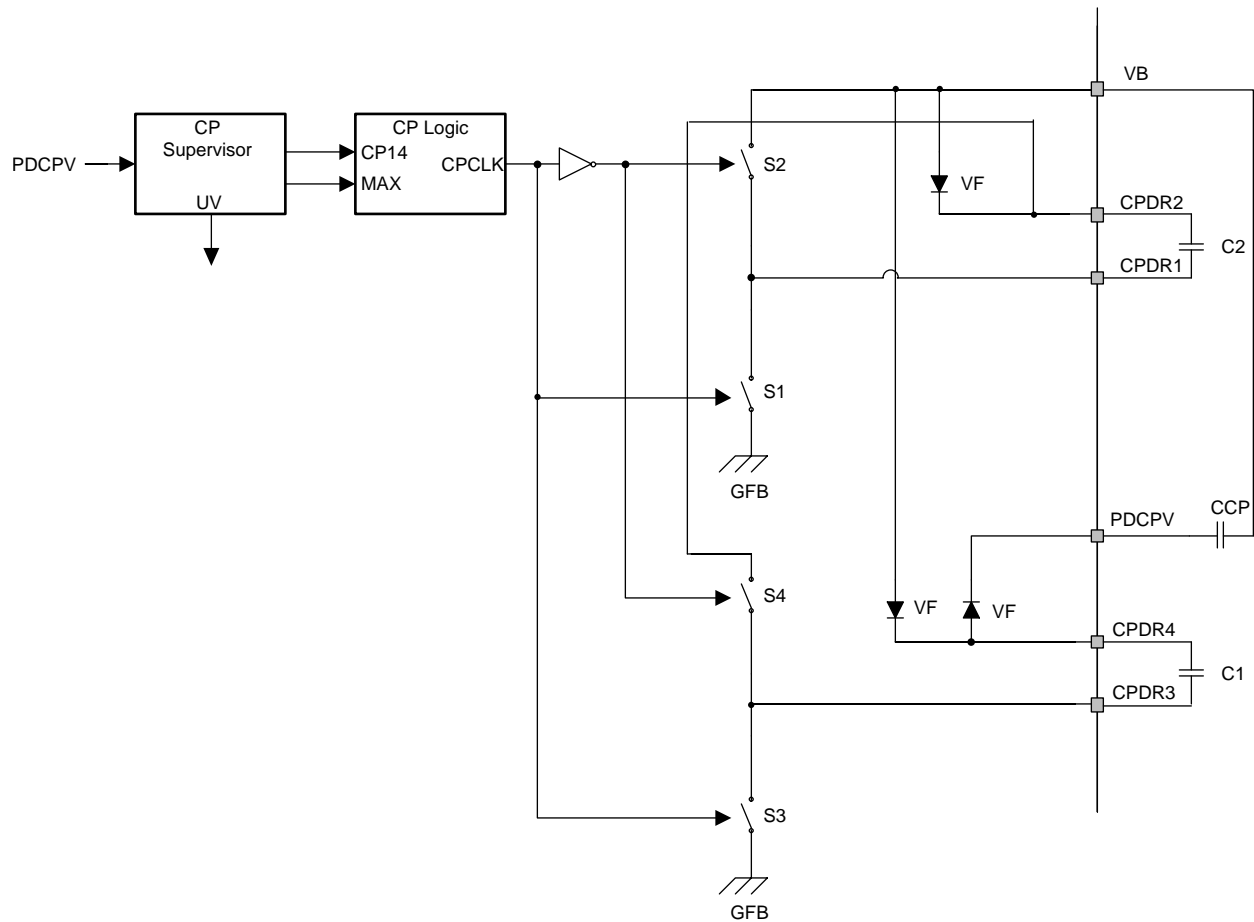

Figure 17. Charge Pump Block Diagram

7.2.5 Pre-Driver

The pre-driver block provides three high-side pre-drivers and three low-side pre-drivers to drive external N-channel MOSFETs. The turn on side of the high-side pre-drivers supply the large N-channel transistor current to quickly charge and PMOS support output voltage up to PDCPV. The turn off side supplies the large N-channel transistor current to quickly discharge, while the low-side pre-drivers supply the large N-channel transistor current for charge and discharge. The output voltage of the low-side pre-driver is controlled by VB and it has VGS protection to make less than 18 V. The pre-driver has a stop condition in some fault conditions (\$16 Error Detection).

DRV3202-Q1

SLVSBJ4B – OCTOBER 2012 – REVISED JULY 2016

www.ti.com

Feature Description (continued)

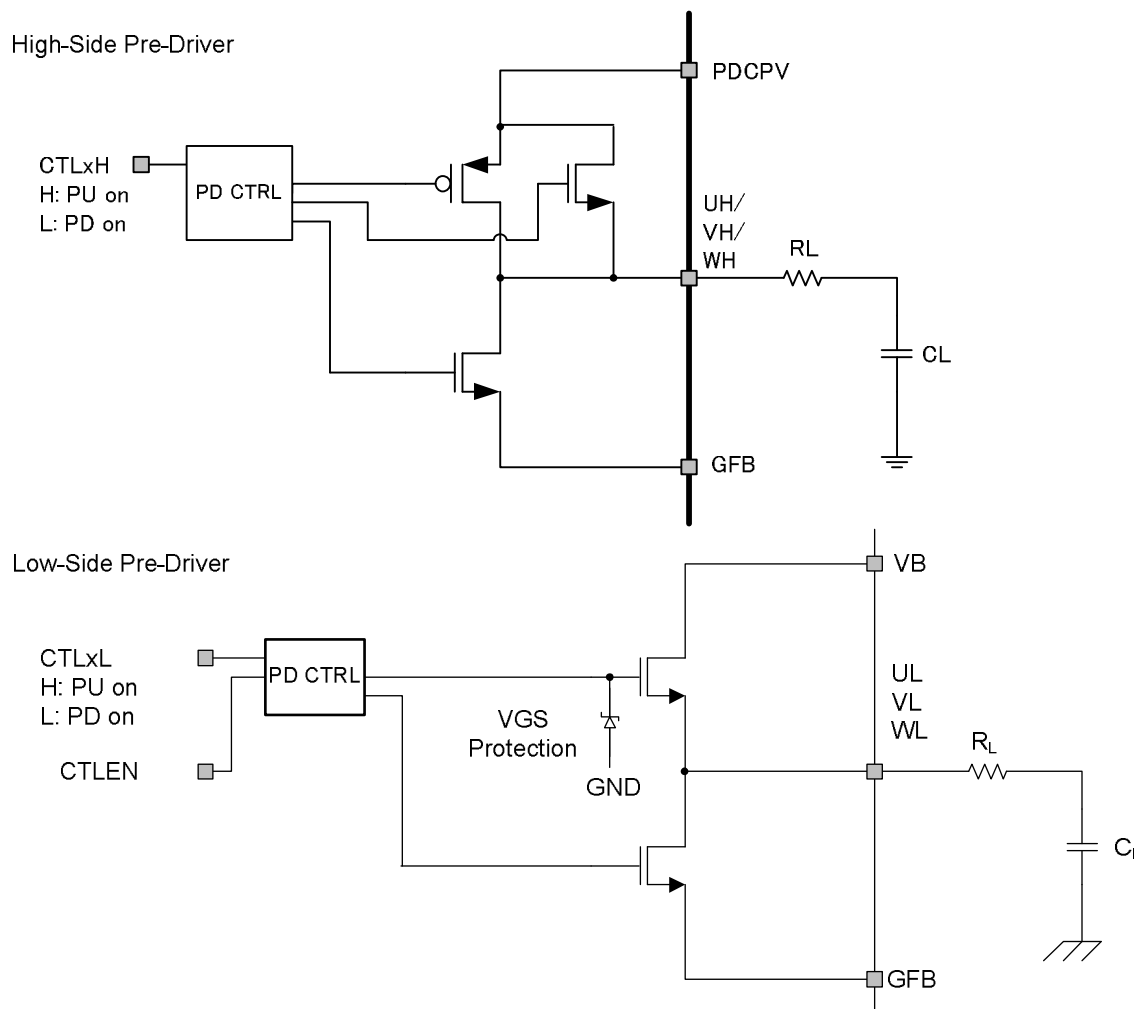

Figure 18. Pre-Driver Block Diagram

7.2.6 Phase Comparator

A 3-channel comparator module monitors the external FET by detecting voltage across the drain-source for high-side and low-side FETs. PHTM is the threshold level of comparators usable for sensorless communication. Figure 19 shows an example of the threshold level. There is no detection when CTLEN = Low.

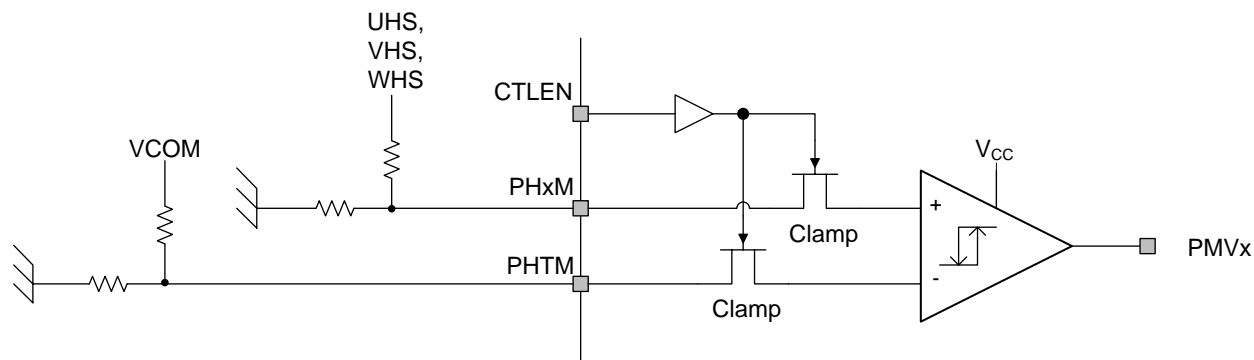

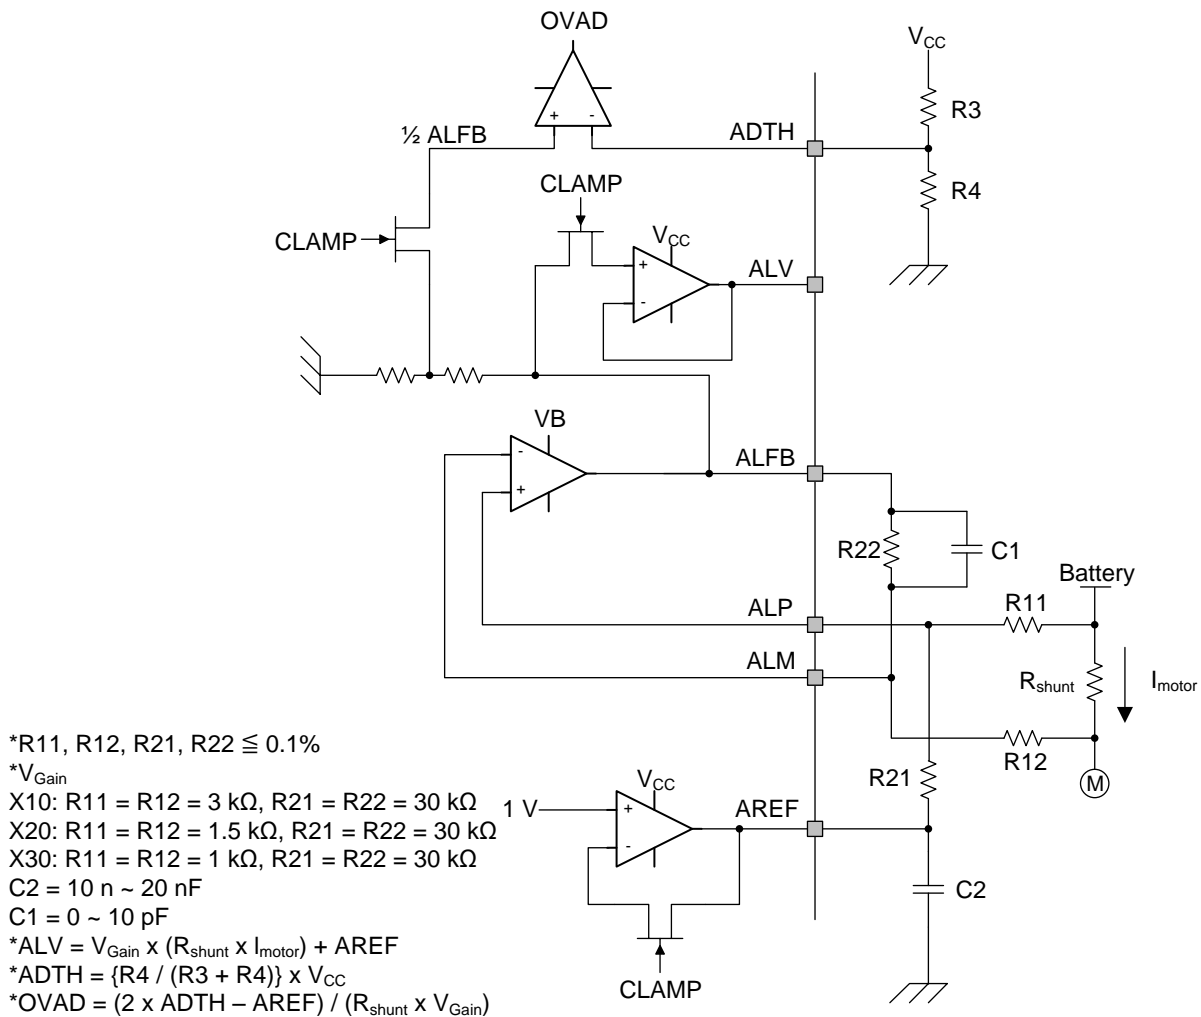

Figure 19. Phase Comparator Block Diagram

## Feature Description (continued)

### 7.2.7 Motor Current Sense

The operational amplifier is operating with an external resistor network for higher flexibility to adjust the current measurement to application requirements. The first stage amplifier is operating with the external resistor and the output voltage up to  $V_B$  at ALFB. The gain of the amplifier is adjustable by external resistors from  $\times 10$  to  $\times 30$ . The second stage amplifier is a buffer to MCU at ALV. Current sense has a comparator for motor overcurrent (OVAD). ADTH is the overcurrent threshold level and sets the value by the external resistor as well. Figure 9 shows the curve of the detection level. ALFB is divided by 2, compare this value with ADTH. In the recommended application, zero-point adjustment is required as a large error offset in the initial condition.

**Figure 20. Motor Current Sense Block Diagram**

### 7.2.8 Phase Amplifier (Sample and Hold Mode and Through Mode)

The 3-channel amplifier module monitors the drain-source for high-side and low-side FETs. Two modes (selected by the SPI) are provided: sample and hold mode, and through mode. Sample and hold is controlled by PSSx at the external pins and PSCx connects the charging capacitor. Through mode is real-time detection and the amplifier has  $\times 1$ – $\times 4$  gain control.

DRV3202-Q1

Feature Description (continued)

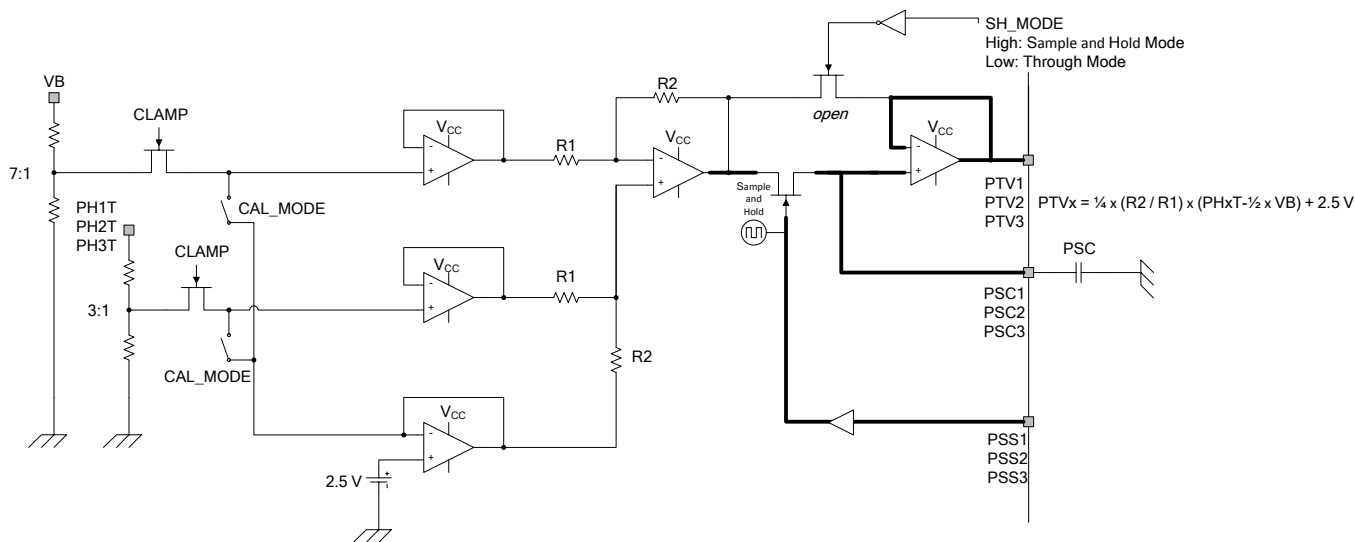

Figure 21. Sample and Hold Mode Block Diagram

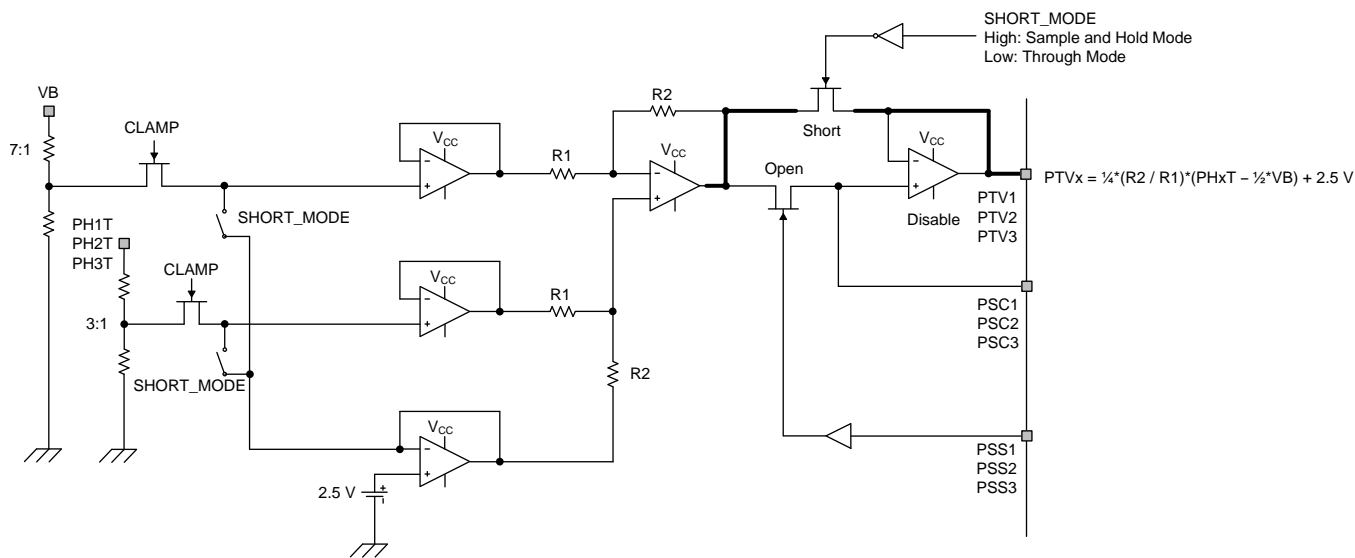

Figure 22. Through Mode Block Diagram

Feature Description (continued)

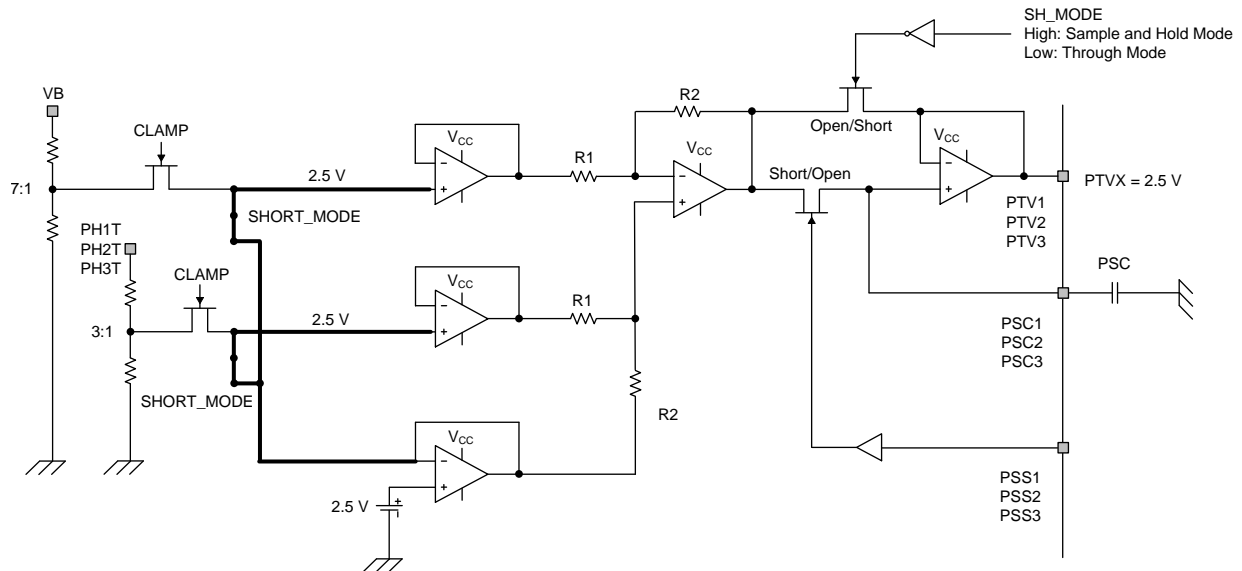

Figure 23. Short Mode (Optional) Block Diagram

7.2.9 Regulators

The regulator block offers a 5-V LDO and a 3.3-V LDO. The  $V_{CC}$  LDO regulates  $V_B$  down to 5 V with an external PNP controlled by the regulator block. The 5-V LDO is supplied to the MCU and other components. The 5-V LDO is protected against a short to GND fault, and the external resistors R1 and R2 set the undervoltage. The  $V_{DD}$  regulator regulates  $V_B$  down to 3.3-V with an internal FET and a controller.

The regulators detect the overvoltage and undervoltage events of both supplies.

Feature Description (continued)

\*  $R_{sns} = 0.2 V / I_{CLVCC}$   
 \*  $V_{CCUV} = 2.325 \times \{(R1+R2) / R2\}$

Figure 24. V<sub>CC</sub> Block Diagram

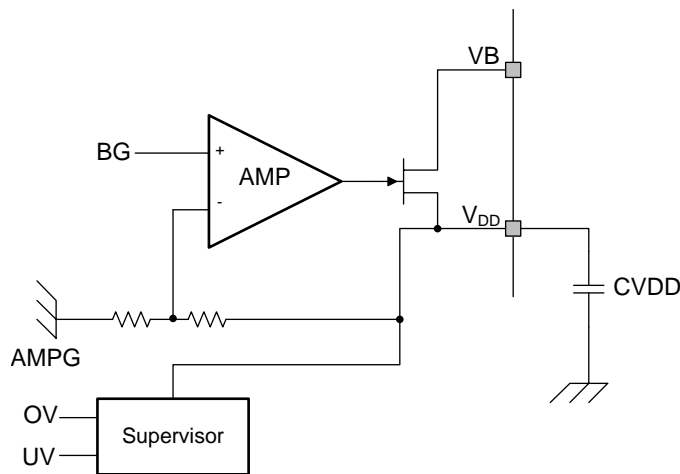

Figure 25. V<sub>DD</sub> Block Diagram

7.2.10 VB Monitor

The block monitors VB overvoltage.

**Feature Description (continued)**

**Figure 26. VB Monitor Block Diagram**

**7.2.11 Thermal Shutdown**

The device has temperature sensors that produce a pre-driver stop condition if the chip temperature exceeds 175°.

**Figure 27. Thermal Shutdown Block Diagram**

**7.2.12 Oscillator**

Oscillator block generates two 10-MHZ clock signals. OSC1 is the main clock used for internal logic synchronization and timing control. OSC2 is the secondary clock which is used to monitor the status of OSC1.

**Figure 28. Oscillator Block Diagram**

7.2.14 Error Detection

Table 1. Error Detection

ITEMS	SPI	PRE-DRIVER	FAULT SIGNAL	RES
VB – Overvoltage	–	STOP	L	H
CP – Overvoltage	–	STOP	L	H
CP – Undervoltage	Error Bit (CPLV)	–	L	H
V <sub>CC</sub> – Overvoltage	Error Bit (VCO)	–	L	H
V <sub>CC</sub> – Undervoltage	–	STOP	L	L

**Table 1. Error Detection (continued)**

ITEMS	SPI	PRE-DRIVER	FAULT SIGNAL	$\overline{RES}$
V <sub>CC</sub> – Overcurrent	Error Bit (V <sub>CC</sub> )	–	H	H
Motor – Overcurrent	Error Bit (OVAD)	STOP	H	H
V <sub>DD</sub> – Overvoltage	Error Bit (VDO)	–	L	H
V <sub>DD</sub> – Undervoltage	–	STOP	L	L
Thermal Shut Down	Error Bit (TD)	STOP	H	H
Watchdog	–	–	L	L
EEPROM Data Check	Error Bit (EEP)	–	L	H
Clock Monitor	–	–	L	L
CAN Overcurrent	Error Bit (CCD)	–	L	H
SPI	Error Bit (SPI)	–	L	H

### 7.3 Device Functional Modes

**Table 2. Motor Overcurrent Truth Table**

$\overline{RES}$	$\overline{OVCR}$	MOTOR OVERCURRENT	OVAD	PRE-DRIVER ENABLE OR DISABLE
0	–	–	0 (Clear)	Disable <sup>(1)</sup>
1	0	–	0 (Clear) <sup>(2)(3)</sup>	Enable
	1	0	Keep	Enable
		1	1 (Set)	Disable

- (1) The CTLEN goes to Hi-Z because the external CPU will not drive it when  $\overline{RES} = 0$ , then all the pre-drivers are turned off because CTLEN is internally pulled down.
- (2) The OVAD is not set, even if a motor overcurrent error is generated during  $\overline{OVCR} = 0$ .
- (3) The OVAD is cleared if  $\overline{OVCR} = 0$  even when the motor overcurrent error is generated.

Register Maps (continued)

Table 3. SPI Bit Map (DIN) (continued)

ITEM	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
DIAG_READ1	0	0	1	0	0	0	–	–	–	–	–	–	–	–	–	–
DIAG_READ2	0	1	0	0	0	0	–	–	–	–	–	–	–	–	–	–
DIAG_READ3	0	1	1	0	0	0	–	–	–	–	–	–	–	–	–	–

In Table 3, the B15–B10 are the control bits, so the each command depends on them (listed below).

1. **B15-B10 = 0 0 0 0 1**

These are the commands:

- 1) Phase AMP Sampling Hold Mode (B7 bit)
  - 0: OFF (through) (INITIAL VALUE)
  - 1: ON (use sample hold mode)
- 2) Phase AMP Short Mode [Short\_Mode] (B6 bit)
  - 0: OFF (no calibration) (INITIAL VALUE)
  - 1: ON (use calibration mode)

2. **B15-B10 = 0 0 0 0 1 0**

These are the commands:

- 1) Phase AMP Gain (B7 bit and B6 bit)
  - B7:0 B6:0; Gain x1 (INITIAL VALUE)
  - B7:0 B6:1; Gain x2
  - B7:1 B6:0; Gain x3
  - B7:1 B6:1; Gain x4

3. **B15-B10 = 0 0 0 0 1 1**

Not used

4. **B15-B10 = 0 0 1 0 0 0**

This command is to read the diagnosis of the current regulator, SPI communication, overvoltage detection, and input diagnosis.

5. **B15-B10 = 0 1 0 0 0 0**

This command is to read the diagnosis of SPI communication.

6. **B15-B10 = 0 1 1 0 0 0**

Not used

7. **B15-B10 = Other command**

This command sets the SPI-NG (DOUT, B7) bit.

Table 4. SPI Bit Map (DOUT)

ITEM	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
ON/OFF COMMAND ECHO BACK	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	1	0	0	–	–	–	–	–	–	–	–
	0	0	0	0	0	1	1	0	–	–	–	–	–	–	–	–
DIAG_READ1	0	0	0	1	0	0	0	0	VCC	OCD	CCD	VCO	VDO	CPLV	TD	EEP
DIAG_READ2	0	0	1	0	0	0	0	0	SPI	–	–	–	–	–	–	–
DIAG_READ3	0	0	1	1	0	0	0	0	–	–	–	–	–	–	–	–

1. **B14-B9 = 0 0 1 0 0 0**

This flag is cleared after the register is read by the CPU.

1) **V<sub>CC</sub> Current Detection (B7)**

- 0: NORMAL
- 1: Fail (Short to GND or open)

2) **Overcurrent Detection (B6)**

- 0: NORMAL
- 1: Fail (Overcurrent)

3) **CAN Current Detection (B5)**

- 0: NORMAL

- 1: Fail (Overcurrent)
- 4) **V<sub>CC</sub> Overvoltage Detection (B4)**  
0: NORMAL  
1: Fail (V<sub>CC</sub> overvoltage)
- 5) **V<sub>DD</sub> Overvoltage Detection (B3)**  
0: NORMAL  
1: Fail (V<sub>DD</sub> overvoltage)
- 6) **CPV Low Voltage Detection (B2)**  
0: NORMAL  
1: Fail (CPV low voltage)
- 7) **Thermal Detection (B1)**  
0: NORMAL  
1: Fail (Overtemperature)
- 8) **EEPROM\* Data Consistency Check (B0)**  
0: NORMAL  
1: Fail (EEPROM DATA CRC error)

\*ASIC calibration EEPROM

**NOTE**

Just after power-on of the IC, some of the bits listed above may be set depending on the apply sequence of VB. It is recommended to issue a DIAG\_READ1 to clear these bits prior to all S/W sequences.

2. **B14-B9 = 0 1 0 0 0 0**

This flag is cleared after the register is read by the CPU.

1) **SPI-NG (B7)**

- 0: NORMAL
- 1: Fail (SPI read and write command is wrong)

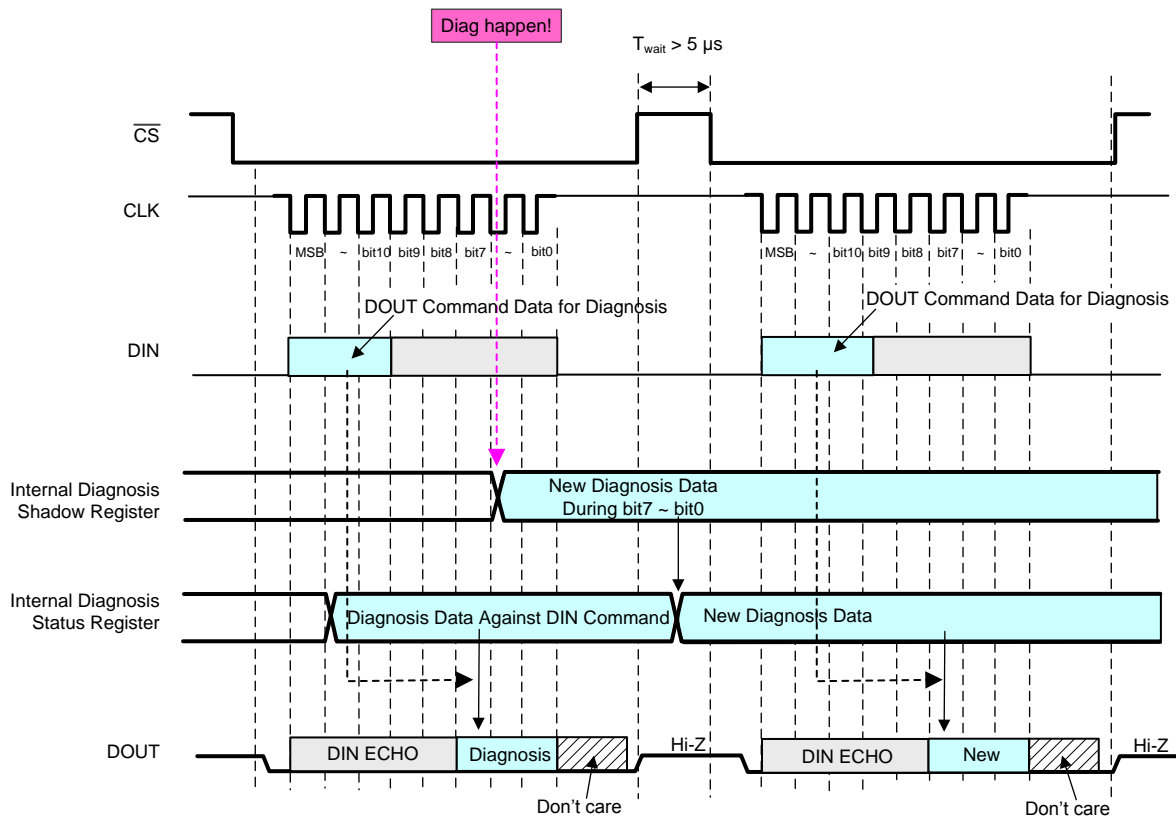

Figure 34. DIAG\_READ

## **DRV3202-Q1**

SLVSBJ4B –OCTOBER 2012–REVISED JULY 2016

[www.ti.com](http://www.ti.com)

### **7.4.1 Internal Diagnosis Register (Status Register and Shadow Register)**

If the diagnosis happens during the SPI communication, the function follows this protocol:

The diagnosis information is stored in the shadow register when the diagnosis happens.

After the output of the previous information a new diagnosis is sent from the shadow to the status register, and both registers are output through the DOUT pin.

In this case, a FAULT signal continues to be output until a new diagnosis is read by the CPU.

All diagnosis bits read by the `DIAG_READ1` command happen before the  $\overline{CS}$  falling edge. So, all the diagnosis events that happen right after the  $\overline{CS}$  falling edge are not read by the current `DIAG_READ1` command, instead they are read by the next `DIAG_READ1` command.

## 8 Device and Documentation Support

### 8.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 8.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 8.3 Trademarks

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 8.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 8.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 9 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV3202QFPQ1	NRND	HTQFP	PFP	80	96	Green (RoHS & no Sb/Br)	NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV3202	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# MECHANICAL DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

4146925/C 07/11

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - F. Falls within JEDEC MS-026

PowerPAD is a trademark of Texas Instruments.

## THERMAL PAD MECHANICAL DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

### THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206327-3/P 05/14

NOTE: A. All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments

# LAND PATTERN DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
- PowerPAD is a trademark of Texas Instruments.

## IMPORTANT NOTICE AND DISCLAIMER
