2.6A, 55V, 0.090 Ohm, N-Channel UltraFET Power MOSFET

This N-Channel power MOSFET is manufactured using the innovative UltraFET™ process. This advanced process technology achieves the lowest possible on-resistance per silicon area, resulting in outstanding performance. This device is capable of withstanding high energy in the avalanche mode and the diode exhibits very low reverse recovery time and stored charge. It was designed for use in applications where power efficiency is important, such as switching regulators, switching converters, motor drivers, relay drivers, low-voltage bus switches, and power management in portable and battery-operated products.

Formerly developmental type TA75307.

Ordering Information

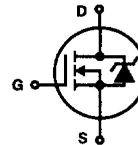
PART NUMBER	PACKAGE	BRAND
HUF75307T3ST	SOT-223	5307

NOTE: HUF75307T3ST is available only in tape and reel.

Features

- 2.6A, 55V
- Ultra Low On-Resistance, $r_{DS(ON)} = 0.090\Omega$
- Diode Exhibits Both High Speed and Soft Recovery
- Temperature Compensating PSPICE® Model
- Thermal Impedance SPICE Model
- Peak Current vs Pulse Width Curve
- UIS Rating Curve
- Related Literature
  - TB334, "Guidelines for Soldering Surface Mount Components to PC Boards"

Symbol



Packaging

SOT-223

Absolute Maximum Ratings $T_A = 25^oC$, Unless Otherwise Specified

			UNITS
Drain to Source Voltage (Note 1)	V_{DSS}	55	V
Drain to Gate Voltage (R_{GS} = 20kΩ) (Note 1)	V_{DGR}	55	V
Gate to Source Voltage	V_{GS}	±20V	V
Drain Current			
Continuous (Figure 2) (Note 2)	I_D	2.6	A
Pulsed Drain Current	I_{DM}	Figure 5	
Pulsed Avalanche Rating	E_{AS}	Figures 6, 14, 15	
Power Dissipation (Note 2)	P_D	1.1	W
Derate Above 25°C		9.09	mW/°C
Operating and Storage Temperature	T_J, T_{STG}	-55 to 150	°C
Maximum Temperature for Soldering			
Leads at 0.063in (1.6mm) from Case for 10s	T_L	300	°C
Package Body for 10s, See Techbrief 334	T_{pkg}	260	°C

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

1. T_J = 25°C to 125°C.

Electrical Specifications $T_A = 25^oC$, Unless Otherwise Specified

PARAMETER	SYMBOL	TEST CONDITIONS		MIN	TYP	MAX	UNITS

Thermal Resistance vs. Mounting Pad Area

The maximum rated junction temperature, $T_{J(MAX)}$, and the thermal resistance of the heat dissipating path determines the maximum allowable device power dissipation, $P_{D(MAX)}$, in an application. Therefore the application's ambient temperature, T_A (°C), and thermal resistance $R_{\theta JA}$ (°C/W) must be reviewed to ensure that $T_{J(MAX)}$ is never exceeded. Equation 1 mathematically represents the relationship and serves as the basis for establishing the rating of the part.

$$P_{D(MAX)} = \frac{(T_{J(MAX)} - T_A)}{R_{\theta JA}} \quad \text{(EQ. 1)}$$

In using surface mount devices such as the SOT-223 package, the environment in which it is applied will have a significant influence on the part's current and maximum power dissipation ratings. Precise determination of the $P_{D(MAX)}$ is complex and influenced by many factors:

1. Mounting pad area onto which the device is attached and whether there is copper on one side or both sides of the board.
2. The number of copper layers and the thickness of the board.
3. The use of external heat sinks.
4. The use of thermal vias.
5. Air flow and board orientation.
6. For non steady state applications, the pulse width, the duty cycle and the transient thermal response of the part, the board and the environment they are in.

Intersil provides thermal information to assist the designer's preliminary application evaluation. Figure 20 defines the $R_{\theta JA}$ for the device as a function of the top copper (component side) area. This is for a horizontally positioned FR-4 board with 1oz copper after 1000 seconds of steady state power with no air flow. This graph provides the necessary information for calculation of the steady state junction temperature or power dissipation. Pulse applications can be evaluated using the Intersil device Spice thermal model or manually utilizing the normalized maximum transient thermal impedance curve.

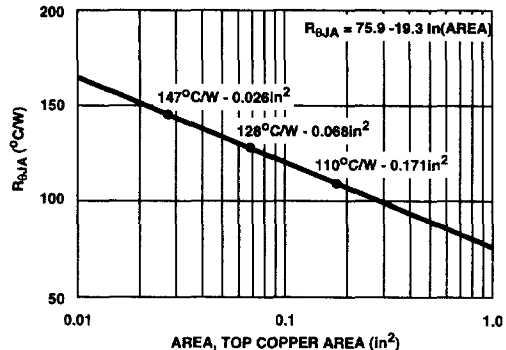

FIGURE 20. THERMAL RESISTANCE vs MOUNTING PAD AREA

Displayed on the curve are the three $R_{\theta JA}$ values listed in the Electrical Specifications table. The three points were chosen to depict the compromise between the copper board area, the thermal resistance and ultimately the power dissipation, $P_{D(MAX)}$. Thermal resistances corresponding to other component side copper areas can be obtained from Figure 20 or by calculation using Equation 2. The area, in square inches is the top copper area including the gate and source pads.

$$R_{\theta JA} = 75.9 - 19.3 \times \ln(\text{Area}) \quad \text{(EQ. 2)}$$
