Functional Description

These bus interface registers are designed to eliminate the extra packages required to buffer existing registers and provide extra data width for wider address/data paths or buses carrying parity. The FCT821T is a buffered, 10-bit wide version of the popular FCT374 function. The FCT823T is a 9-bit wide buffered register with clock enable (EN) and clear (CLR) ideal for parity bus interfacing in high-performance microprogrammed systems. The FCT825T is an 8-bit buffered register with all the FCT823T controls plus multiple enables ($\overline{OE}_1, \overline{OE}_2, \overline{OE}_3$) to allow multiuser control of the interface, e.g., CS, DMA, and RD/WR. They are ideal for use as an output port requiring high I_{OL}/I_{OH} .

These devices are designed for high-capacitance load drive capability, while providing low-capacitance bus loading at both inputs and outputs. Outputs are designed for low-capacitance bus loading in the high-impedance state and are designed with a power-off disable feature to allow for live insertion of boards.

Pin Description

Name	I/O	Description
D	I	The D flip-flop data inputs.
$\overline{\text{CLR}}$	I	When $\overline{\text{CLR}}$ is LOW and $\overline{\text{OE}}$ is LOW, the Q outputs are LOW. When $\overline{\text{CLR}}$ is HIGH, data can be entered into the register.
CP	O	Clock Pulse for the register; enters data into the register on the LOW-to-HIGH transition.
Y	O	The register three-state outputs.
EN	I	Clock Enable. When $\overline{\text{EN}}$ is LOW, data on the D input is transferred to the Q output on the LOW-to-HIGH clock transition. When $\overline{\text{EN}}$ is HIGH, the Q outputs do not change state, regardless of the data or clock input transitions.
$\overline{\text{OE}}$	I	Output Control. When $\overline{\text{OE}}$ is HIGH, the Y outputs are in the high-impedance state. When $\overline{\text{OE}}$ is LOW, the TRUE register data is present at the Y outputs.

Capacitance^[6]

Parameter	Description	Typ. ^[5]	Max.	Unit
C _{IN}	Input Capacitance	5	10	pF
C _{OUT}	Output Capacitance	9	12	pF

Notes:

- Typical values are at V_{CC}=5.0V, T_A=+25°C ambient.
- This parameter is guaranteed but not tested.
- Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

 D_H = Duty Cycle for TTL inputs HIGH
 N_T = Number of TTL inputs at D_H
 I_{CCD} = Dynamic Current caused by an input transition pair (HLH or LHL)
 f_0 = Clock frequency for registered devices, otherwise zero
 f_1 = Input signal frequency
