Description

HA-2640 and HA-2645 are monolithic operational amplifiers which are designed to deliver unprecedented dynamic specifications for a high voltage internally compensated device. These dielectrically isolated devices offer very low values for offset voltage and offset current coupled with large output voltage swing and common mode input voltage.

For maximum reliability, these amplifiers offer unconditional output overload protection through current limiting and a chip temperature sensing circuit. This sensing device turns the amplifier "off", when the chip reaches a certain temperature level.

These amplifiers deliver $\pm 35V$ common mode input voltage swing, $\pm 35V$ output voltage swing, and up to $\pm 40V$

supply range for use in such designs as regulators, power supplies, and industrial control systems. 4MHz gain bandwidth and $5V/\mu s$ slew rate make these devices excellent components for high performance signal conditioning applications. Outstanding input and output voltage swings coupled with a low 5nA offset current make these amplifiers excellent components for resolver excitation designs.

The HA-2640/2645 are available in Metal Can (TO-99) or Ceramic Mini-DIP and can be used as high performance pin-for-pin replacements for many general performance amplifiers. HA-2640 is specified from $-55^{\circ}C$ to $+125^{\circ}C$ and HA-2645 is specified over the $0^{\circ}C$ to $+75^{\circ}C$ range.
