## [MEMO]

#### NOTES FOR CMOS DEVICES -

## (1) PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

## ② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

## (3) STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

FIP and IEBus are trademarks of NEC Corporation.

Windows and Windows NT are either registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.

PC/AT is a trademark of International Business Machines Corporation.

HP9000 Series 700 and HP-UX are trademarks of Hewlett-Packard Company.

SPARCstation is a trademark of SPARC International, Inc.

Solaris and SunOS are trademarks of Sun Microsystems, Inc.

Ethernet is a trademark of Xerox Corporation.

TRON is an acronym of The Realtime Operating system Nucleus.

ITRON is an abbreviation of Industrial TRON.

The export of these products from Japan is regulated by the Japanese government. The export of some or all of these products may be prohibited without governmental license. To export or re-export some or all of these products from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

- The information in this document is current as of July, 2002. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.
- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of
  third parties by or arising from the use of NEC semiconductor products listed in this document or any other
  liability arising from the use of such products. No license, express, implied or otherwise, is granted under any
  patents, copyrights or other intellectual property rights of NEC or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative
  purposes in semiconductor product operation and application examples. The incorporation of these
  circuits, software and information in the design of customer's equipment shall be done under the full
  responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third
  parties arising from the use of these circuits, software and information.
- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers
  agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize
  risks of damage to property or injury (including death) to persons arising from defects in NEC
  semiconductor products, customers must incorporate sufficient safety measures in their design, such as
  redundancy, fire-containment, and anti-failure features.
- NEC semiconductor products are classified into the following three quality grades:
  - "Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.
  - "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
  - "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
  - "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.

(Note)

- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).

M8E 00.4

## **Regional Information**

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- · Device availability
- Ordering information
- · Product release schedule
- · Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

#### INTRODUCTION

**Target Readers** 

This manual is intended for users who wish to understand the functions of the  $\mu$ PD780988 Subseries and to design and develop application systems and programs using these microcontrollers.

**Purpose** 

This manual is intended to give users an understanding of the functions described in the organization below.

Organization

The  $\mu$ PD780988 Subseries User's Manual is divided into two parts: this manual and instructions (common to the 78K/0 Series).

μPD780988 Subseries User's Manual (This manual)

- · Pin functions
- · Internal block functions
- · Interrupt functions
- · Other on-chip peripheral functions
- Electrical specifications

78K/0 Series User's Manual Instructions

- · CPU functions
- · Instruction set
- · Explanation of instruction

**How to Read This Manual** 

It is assumed that the reader of this manual has general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

- □ To those who use this manual as the manual of the  $\mu$ PD780982(A), 780983(A), 780984(A), 780986(A), 780988(A), and 78F0988A(A):
  - → Unless there are functional differences, the  $\mu$ PD780982, 780983, 780984, 780986, 780988, and 78F0988A are treated as representative devices, therefore, when this is used as a manual for the  $\mu$ PD780982(A), 780983(A), 780984(A), 780986(A), 780988(A), and 78F0988A(A) read the product names as  $\mu$ PD780982(A), 780983(A), 780984(A), 780986(A), 780988(A), and 78F0988A(A).

☐ To understand the functions in general:

- $\rightarrow$  Read this manual in the order of the contents.
- ☐ How to interpret register format:
  - → The bit name of a bit whose number is encircled is defined as a reserved word in the RA78K0, and in the header file sfrbit.in the CC78K0.

☐ When you know a register name and want to confirm its details:

- → Read APPENDIX C REGISTER INDEX.
- $\square$  To know the  $\mu$ PD789830 Subseries instruction functions in detail:
  - → Refer to 78K/0 Series Instructions User's Manual (U12326E).

Caution Examples in this manual employ the "standard" quality grade for general electronics. When using examples in this manual for applications that require the "special" quality grade, review the quality grade of each part and/or circuit actually used.

**Conventions** Data significance: Higher digits on the left and lower digits on the right

**Note**: Footnote for item marked with **Note** in the text

**Caution**: Information requiring particular attention

**Remark**: Supplementary information Numerical representation: Binary ... xxxx or xxxxB

Decimal ... xxxx

Hexadecimal ... xxxxH

## **★** Related Documents

| 6-5      | Format of Capture/Compare Control Register 00   | 113  |  |  |  |  |

## LIST OF FIGURES (2/6)

| Figure No. Title |   | Page |
|------------------|---|------|
| 6-6              | Format of Capture/Compare Control Register 01   | 114  |
| 6-7              | Format of Timer Output Control Register 00  | 115  |
| 6-8              | Format of Timer Output Control Register 01  | 116  |
| 6-9              | Format of Prescaler Mode Register 00  | 117  |
| 6-10             | Format of Prescaler Mode Register 01  | 118  |
| 6-11             | Format of Port Mode Register 5  | 119  |
| 6-12             | Control Register Settings for Interval Timer Operation                                  | 120  |
| 6-13             | Interval Timer Configuration Diagram  | 121  |
| 6-14             | Timing of Interval Timer Operation  | 121  |
| 6-15             | Control Register Settings for PPG Output Operation                                      | 122  |
| 6-16             | Configuration Diagram of PPG Output   | 123  |
| 6-17             | PPG Output Operation Timing   | 123  |
| 6-18             | Control Register Settings for Pulse Width Measurement with Free-Running Counter         |      |
|                  | and One Capture Register  | 124  |
| 6-19             | Configuration Diagram for Pulse Width Measurement with Free-Running Counter             | 125  |
| 6-20             | Timing of Pulse Width Measurement Operation with Free-Running Counter                   |      |
|                  | and One Capture Register (with Both Edges Specified)                                    | 125  |
| 6-21             | Control Register Settings for Measurement of Two Pulse Widths with Free-Running Counter | 126  |
| 6-22             | CR01n Capture Operation with Rising Edge Specified                                      | 127  |
| 6-23             | Timing of Pulse Width Measurement Operation with Free-Running Counter                   |      |
|                  | (with Both Edges Specified)   | 127  |
| 6-24             | Control Register Settings for Pulse Width Measurement with Free-Running Counter         |      |
|                  | and Two Capture Registers   | 128  |
| 6-25             | Timing of Pulse Width Measurement Operation by Free-Running Counter                     |      |
|                  | and Two Capture Registers (with Rising Edge Specified)                                  |      |
| 6-26             | Control Register Settings for Pulse Width Measurement by Means of Restart               | 130  |
| 6-27             | Timing of Pulse Width Measurement Operation by Means of Restart                         |      |
|                  | (with Rising Edge Specified)  |      |
| 6-28             | Control Register Settings in External Event Counter Mode                                |      |
| 6-29             | External Event Counter Configuration Diagram  |      |
| 6-30             | External Event Counter Operation Timings (with Rising Edge Specified)                   |      |
| 6-31             | Control Register Settings in Square-Wave Output Mode                                    |      |
| 6-32             | Square-Wave Output Operation Timing   |      |
| 6-33             | 16-Bit Timer Counter Start Timing   |      |
| 6-34             | Timing After Change of Compare Register During Timer Count Operation                    |      |
| 6-35             | Capture Register Data Retention Timing  |      |
| 6-36             | Operation Timing of OVF0n Flag  | 136  |
| 7-1              | Block Diagram of 8-Bit Timer/Event Counter 50   |      |
| 7-2              | Block Diagram of 8-Bit Timer/Event Counter 51   | 140  |
| 7-3              | Block Diagram of 8-Bit Timer/Event Counter 52   | 140  |
| 7-4              | Format of 8-Bit Timer Mode Control Register 50  |      |
| 7-5              | Format of 8-Bit Timer Mode Control Register 51  | 144  |
| 7-6              | Format of 8-Bit Timer Mode Control Register 52  | 145  |

## LIST OF FIGURES (3/6)

| Figure No. Title |  | Page |
|------------------|--|------|
| 7-7              | Format of Timer Clock Select Register 50                                       | 146  |
| 7-8              | Format of Timer Clock Select Register 51                                       | 147  |
| 7-9              | Format of Timer Clock Select Register 52                                       | 147  |
| 7-10             | Format of Port Mode Register 2   | 148  |
| 7-11             | Interval Timer Operation Timing  | 149  |
| 7-12             | External Event Counter Operation Timing (with Rising Edge Specified)           | 152  |
| 7-13             | Square-Wave Output Operation Timing  | 153  |
| 7-14             | PWM Output Operation Timing  | 155  |
| 7-15             | Operation Timing When CR5n Is Changed  | 156  |
| 7-16             | 16-Bit Resolution Cascade Mode (with TM50 and TM51)                            | 157  |
| 7-17             | 16-Bit Resolution Cascade Mode (with TM51 and TM52)                            |      |
| 7-18             | Start Timing of 8-Bit Timer Counter  |      |
| 7-19             | Timing After Changing Values of Compare Registers During Timer Count Operation | 159  |
| 8-1              | Block Diagram of 10-Bit Inverter Control Timer                                 | 161  |
| 8-2              | Format of Inverter Timer Control Register 7                                    | 164  |
| 8-3              | Format of Inverter Timer Mode Register 7                                       | 165  |
| 8-4              | TM7 Operation Timing (Basic Operation)   | 169  |
| 8-5              | TM7 Operation Timing (CMn (BFCMn) ≥ CM3 (BFCM3))                               | 170  |
| 8-6              | TM7 Operation Timing (CMn (BFCMn) = 000H)                                      | 171  |
| 8-7              | TM7 Operation Timing (CMn (BFCMn) = CM3 - 1/2DTM, CMn (BFCMn) > CM3 - 1/2DTM)  | 172  |
| 9-1              | Watchdog Timer Block Diagram   | 174  |
| 9-2              | Format of Watchdog Timer Clock Select Register                                 | 175  |
| 9-3              | Format of Watchdog Timer Mode Register   | 176  |
| 9-4              | Format of Oscillation Stabilization Time Select Register                       | 177  |
| 10-1             | Block Diagram of Real-Time Output Port   | 181  |
| 10-2             | Configuration of Real-Time Output Buffer Register 0                            | 183  |
| 10-3             | Configuration of Real-Time Output Buffer Register 1                            | 184  |
| 10-4             | Format of Port Mode Register 3   | 185  |
| 10-5             | Format of Real-Time Output Port Mode Register 0                                | 185  |
| 10-6             | Format of Real-Time Output Port Mode Register 1                                | 186  |
| 10-7             | Format of Real-Time Output Port Control Register 0                             | 187  |
| 10-8             | Format of Real-Time Output Port Control Register 1                             | 188  |
| 10-9             | Format of DC Control Register 0  | 189  |
| 10-10            | Format of DC Control Register 1  | 190  |
| 10-11            | Real-Time Output Port Operation Timing Example (8 Bits × 1)                    | 193  |
| 10-12            | Real-Time Output Port Operation Timing Example (6 Bits × 1)                    | 198  |
| 11-1             | A/D Converter Block Diagram  | 203  |
| 11-2             | Format of A/D Converter Mode Register 0  | 206  |
| 11-3             | Format of Analog Input Channel Specification Register 0                        | 207  |
| 11-4             | Basic Operation of A/D Converter   | 209  |

## LIST OF FIGURES (4/6)

| Figure No | o. Title   | Page |
|-----------|--|------|
| 11-5      | Relationship Between Analog Input Voltage and A/D Conversion Result                          | 210  |
| 11-6      | A/D Conversion by Hardware Start (with Falling Edge Specified)                               | 211  |
| 11-7      | A/D Conversion by Software Start   | 212  |
| 11-8      | Example of Reducing Current Consumption in Standby Mode                                      | 213  |
| 11-9      | Processing Analog Input Pin  | 214  |
| 11-10     | A/D Conversion End Interrupt Request Generation Timing                                       | 215  |
| 11-11     | Processing of AVDD Pin   | 215  |
| 11-12     | Timing of Reading Conversion Result (When Conversion Result Is Undefined)                    | 216  |
| 11-13     | Timing of Reading Conversion Result (When Conversion Result Is Normal)                       | 216  |
| 11-14     | Example of Connecting Capacitor to AVREF Pin   | 217  |
| 11-15     | Internal Equivalent Circuit of Pins ANI0 to ANI7   | 218  |
| 11-16     | Example of Connection if Signal Source Impedance Is High                                     | 218  |
| 11-17     | Overall Error  | 220  |
| 11-18     | Quantization Error   | 220  |
| 11-19     | Zero-Scale Error   | 221  |
| 11-20     | Full-Scale Error   | 221  |
| 11-21     | Integral Linearity Error   | 221  |
| 11-22     | Differential Linearity Error   | 221  |
| 12-1      | Block Diagram of Serial Interface UART00   | 223  |
| 12-2      | Block Diagram of UART00 Baud Rate Generator  | 224  |

## **CHAPTER 1 GENERAL**

## **★ 1.1 Expanded-Specification Products and Conventional Products**

The expanded-specification product and conventional product refer to the following products.

Expanded-specification product: Products with a rank Note other than K

- Mask ROM versions for which orders were received after December 1, 2001.
- Flash memory versions that were shipped after January 1, 2002.

Conventional product: Products with rank Note K

• Products other than the above expanded specification products.

Note The rank is indicated by the 5th digit from the left in the lot number marked on the package.

Lot number 
$$OOOO$$
  $OO$   $A$   $X$   $X$   $X$   $X$   $X$   $X$  Year code Week code NEC control code

Expanded-specification products and conventional products differ in the power supply voltage range and operating frequency ratings. The differences are shown in Table 1-1.

Table 1-1. Differences Between Expanded-Specification Products and Conventional Products

| Power Supply Voltage (VDD) | Guaranteed Operating Speed (Operating Frequency) |                                 |  |
|----------------------------|--|---------------------------------|--|
|                            | Conventional Products                            | Expanded-Specification Products |  |
| 4.5 to 5.5 V               | 8.38 MHz (0.238 μs)                              | 12 MHz (0.166 μs)               |  |
| 4.0 to 5.5 V               | 8.38 MHz (0.238 μs)                              | 8.38 MHz (0.238 μs)             |  |
| 3.0 to 5.5 V               | _  | 8.38 MHz (0.238 μs)             |  |

Remark The parenthesized values indicates the minimum instruction execution time.

## 1.2 Features

Internal ROM and RAM

| Item        | Program Memory |                         | Data Memory             |                               |
|-------------|----------------|-------------------------|-------------------------|-------------------------------|
| Part Number | Internal ROM   | Flash Memory            | Internal High-Speed RAM | Internal Expansion RAM        |
| μPD780982   | 16 KB          | _                       | 1,024 bytes             | _                             |
| μPD780983   | 24 KB          | _                       |                         | _                             |
| μPD780984   | 32 KB          | _                       |                         | _                             |
| μPD780986   | 48 KB          | _                       |                         | 1,024 bytes                   |
| μPD780988   | 60 KB          | _                       |                         |                               |
| μPD78F0988A | _              | 60 KB <sup>Note 1</sup> |                         | 1,024 bytes <sup>Note 2</sup> |

Notes 1. 16, 24, 32, 48, or 60 KB are selectable by using the internal memory size switching register (IMS).

- 2. 0 or 1,024 bytes are selectable by using the internal expansion RAM size switching register (IXS).
- Less EMI (Electro Magnetic Interference) noise than existing μPD78014 and 78018F Subseries
- External memory expansion space: 256 bytes (except μPD780988)
- Minimum instruction execution time: 0.166  $\mu$ s (@ fx = 12 MHz operation), 0.238  $\mu$ s (@ fx = 8.38 MHz operation)
  - · Instruction set suitable for system control
    - · Bit processing in entire address space
    - · Multiply/divide instructions
  - I/O ports: 47
  - A/D converter
    - · 10-bit resolution × 8 channels
  - Serial interface: 3 channels
    - · UART mode: 2 channels
    - · 3-wire serial I/O mode: 1 channel
  - Timer: 7 channels
    - 10-bit inverter control timer: 1 channel
      16-bit timer/event counter: 2 channels
      8-bit timer/event counter: 3 channels
      Watchdog timer: 1 channel
  - Vectored interrupts: 26
- ◆ Power supply voltage: VDD = 3.0 to 5.5 V (expanded-specification products)

 $V_{DD} = 4.0$  to 5.5 V (conventional products)

Note Expanded-specification products only.

## 1.3 Applications

Motor control for inverter air conditioners, washing machines, refrigerators, etc.

## 1.4 Ordering Information

|   | Part Number                              | Package                              | Internal ROM |
|---|--|--------------------------------------|--------------|
|   | μPD780982CW-×××                          | 64-pin plastic SDIP (19.05 mm (750)) | Mask ROM     |

**Remark** ××× indicates ROM code suffix.

Please refer to **Quality Grades on NEC Semiconductor Devices (C11531E)** published by NEC Corporation to know the specification of the quality grades of the devices and applications.

## 1.6 Pin Configuration (Top View)

• 64-pin plastic SDIP (19.05 mm (750))

 $\mu$ PD780982CW-xxx, 780983CW-xxx, 780984CW-xxx, 780986CW-xxx,  $\mu$ PD780988CW-xxx, 78F0988ACW

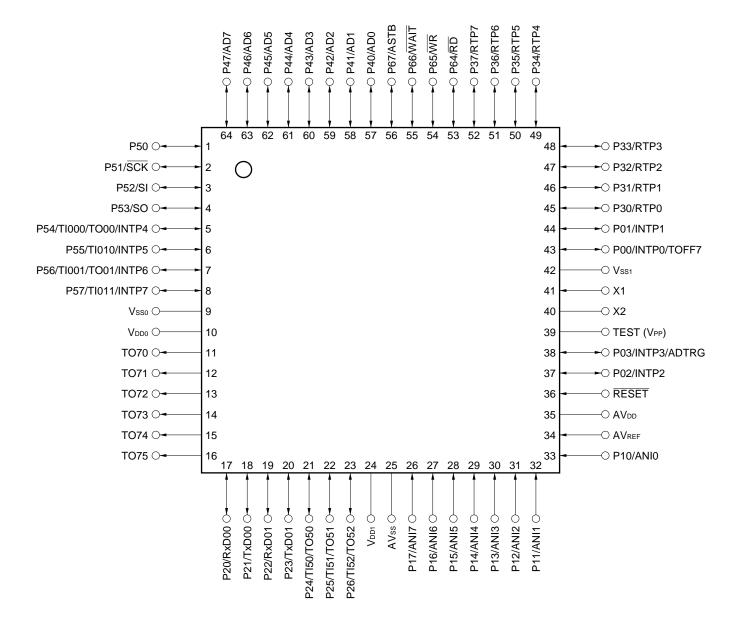

- Cautions 1. Connect the TEST pin directly to Vsso.
- ★ 2. Connect the VPP pin directly to the Vsso pin in normal operation mode.
  - 3. Connect the VPP pin to Vsso via a 10 k $\Omega$  pull-down resistor in the flash memory writing mode.
  - 4. The 64-pin plastic SDIP (19.5 mm (750)) package is not supported for special quality grade products.
  - **Remarks 1.** The pin connection in parentheses is for the  $\mu$ PD78F0988A.
    - 2. When the μPD780988 Subseries is used in applications where the noise generated inside the microcontroller needs to be reduced, the implementation of noise reduction measures, such as supplying voltage to V<sub>DD0</sub> and V<sub>DD1</sub> individually and connecting V<sub>SS0</sub> and V<sub>SS1</sub> to different ground lines, is recommended.

#### 64-pin plastic QFP (14 x 14)

μPD780982GC-xxx-AB8, 780983GC-xxx-AB8, 780984GC-xxx-AB8, μPD780986GC-xxx-AB8, 780988GC-xxx-AB8, 780988GC-AB8, μPD780982GC(A)-xxx-AB8, 780983GC(A)-xxx-AB8, 780984GC(A)-xxx-AB8, μPD780986GC(A)-xxx-AB8, 780988GC(A)-xxx-AB8, 78F0988AGC(A)-AB8

## • 64-pin plastic LQFP (14 x 14)

- Cautions 1. Connect the TEST pin directly to Vsso.
- 2. Connect the VPP pin directly to the Vsso pin in normal operation mode.
- 3. Connect the V<sub>PP</sub> pin to V<sub>SS0</sub> via a 10 k $\Omega$  pull-down resistor in the flash memory writing mode.

- Remarks 1. The pin connection in parentheses is for the  $\mu$ PD78F0988A.
  - When the  $\mu$ PD780988 Subseries is used in applications where the noise generated inside the microcontroller needs to be reduced, the implementation of noise reduction measures, such as supplying voltage to VDD0 and VDD1 individually and connecting Vss0 and Vss1 to different ground lines, is recommended.

## 1.7 78K/0 Series Lineup

The products in the 78K/0 Series are listed below. The names enclosed in boxes are subseries names.

**Remark** VFD (Vacuum Fluorescent Display) is referred to as FIP<sup>TM</sup> (Fluorescent Indicator Panel) in some documents, but the functions of the two are the same.

The major functional differences among the subseries are listed below.

## • Non-Y subseries

|                  |            | ROM              | Timer |        |       | 8-Bit | 10-Bit | 8-Bit | Serial Interface | I/O                             | VDD | External      |           |

**Remark** Functions other than the serial interface are common to both the Y and non-Y subseries.

## 1.8 Block Diagram

Remarks 1. The internal ROM and RAM capacities differ depending on the product.

2. The pin connection in parentheses is for the  $\mu$ PD78F0988A.

- Notes 1. The capacity of the flash memory can be changed using the internal memory size select register (IMS).
  - 2. The capacity of the internal expansion RAM can be changed using the internal expansion RAM size select register (IXS).
  - **3.** Standard quality grade products only.

37

The table below shows the outline of timer/event counters (for details, refer to CHAPTER 6 16-BIT TIMER/EVENT COUNTER, CHAPTER 7 8-BIT TIMER/EVENT COUNTER, CHAPTER 8 10-BIT INVERTER CONTROL TIMER, CHAPTER 9 WATCHDOG TIMER).

|           |                         | 16-Bit Timer/<br>Event Counter | 8-Bit Timer/<br>Event Counter | 10-Bit Inverter<br>Control Timer | Watchdog Timer            |
|-----------|-------------------------|--------------------------------|-------------------------------|----------------------------------|---------------------------|
| Operation | Interval timer          | 2 channels                     | 3 channels                    | 1 channel                        | 1 channel <sup>Note</sup> |
| Mode      | External event counter  | V                              | √                             | _                                | _                         |
| Function  | Timer output            | $\checkmark$                   | √                             | √                                | _                         |
|           | PWM output              | -                              | √                             | _                                | _                         |
|           | PPG output              | V                              | _                             | _                                | _                         |
|           | Pulse width measurement | $\checkmark$                   | _                             | _                                | _                         |
|           | Square-wave output      | √                              | √                             | _                                | _                         |
|           | Interrupt request       | V                              | √                             | √                                | √                         |

Note The watchdog timer can perform either the watchdog timer function or the interval timer function.

## 1.10 Differences Between Standard Quality Grade Products and (A) Products

The differences between standard grade products ( $\mu$ PD780982, 780983, 780984, 780986, 780988, 78F0988A) and (A) products ( $\mu$ PD780982(A), 780983(A), 780984(A), 780986(A), 780988(A), 78F0988A(A)) are shown in Table 1-2.

Table 1-2. Differences Between Standard Quality Grade Products and (A) Products

| Part Number   | Standard Products                      | (A) Products                    |
|---------------|--|---------------------------------|
| Item          |  |                                 |
| Quality grade | Standard                               | Special                         |
|               |  |                                 |
| Package       | • 64-pin plastic SDIP (19.05 mm (750)) | • 64-pin plastic QFP (14 x 14)  |
|               | • 64-pin plastic QFP (14 x 14)         | • 64-pin plastic LQFP (14 x 14) |
|               | • 64-pin plastic LQFP (14 x 14)        |                                 |

## 1.11 Differences Between Flash Memory Products $\mu$ PD78F0988A and $\mu$ PD78F0988

Table 1-3 shows the differences between the  $\mu$ PD78F0988A and  $\mu$ PD78F0988 (old product).

Table 1-3. Differences Between  $\mu$ PD78F0988A and  $\mu$ PD78F0988

| Part Number Item  | μPD78F0988A  | μPD78F0988 (Old Product)                                  |
|-------------------|--|---|
| Flash memory area | 2 areas 0: 0 to 1FFFH 1: 2000H to EFFFH  | 3 areas 0: 0 to 1FFFH 1: 2000H to 7FFFH 2: 8000H to EFFFH |
| Quality grade     | Standard     Special 64-pin plastic QFP (14 x 14),     64-pin plastic LQFP (14 x 14) | Standard  |

## **CHAPTER 2 PIN FUNCTIONS**

## 2.1 List of Pin Functions

# (1) Port pins

| Pin Name   | I/O   | Function   | After Reset | Alternate<br>Function |
|------------|-------|--|-------------|-----------------------|
| P00        | I/O   | Port 0   | Input       | INTP0/TOFF7           |
| P01        |       | 4-bit I/O port   |             | INTP1                 |
| P02        |       | Input/output can be specified in 1-bit units.                              |             | INTP2                 |
| P03        |       | Use of an on-chip pull-up resistor can be specified by a software setting. |             | INTP3/ADTRG           |
| P10 to P17 | Input | Port 1   | Input       | ANI0 to ANI7          |
|            |       | 8-bit input only port  |             |                       |
| P20        | I/O   | Port 2   | Input       | RxD00                 |
| P21        |       | 7-bit I/O port   |             | TxD00                 |
| P22        |       | Input/output can be specified in 1-bit units.                              |             | RxD01                 |
| P23        |       | Use of an on-chip pull-up resistor can be specified by a software setting. |             | TxD01                 |
| P24        |       |  |             | TI50/TO50             |
| P25        |       |  |             | TI51/TO51             |
| P26        |       |  |             | TI52/TO52             |
| P30 to P37 | I/O   | Port 3   | Input       | RTP0 to RTP7          |
|            |       | 8-bit I/O port   |             |                       |
|            |       | Input/output can be specified in 1-bit units.                              |             |                       |
|            |       | Use of an on-chip pull-up resistor can be specified by a software setting. |             |                       |
| P40 to P47 | I/O   | Port 4   | Input       | AD0 to AD7            |
|            |       | 8-bit I/O port   |             |                       |
|            |       | Input/output can be specified in 1-bit units.                              |             |                       |
|            |       | Use of an on-chip pull-up resistor can be specified by a software setting. |             |                       |
| P50        | I/O   | Port 5   | Input       | _                     |
| P51        |       | 8-bit I/O port   |             | SCK                   |
| P52        |       | Input/output can be specified in 1-bit units.                              |             | SI                    |
| P53        |       | LEDs can be driven directly.   |             | SO                    |
| P54        |       | Use of an on-chip pull-up resistor can be specified by a software setting. |             | INTP4/TI000/TO00      |
| P55        |       |  |             | INTP5/TI010           |
| P56        | ]     |  |             | INTP6/TI001/TO01      |
| P57        | ]     |  |             | INTP7/TI011           |
| P64        | I/O   | Port 6   | Input       | RD                    |
| P65        | ]     | 4-bit I/O port   |             | WR                    |
| P66        |       | Input/output can be specified in 1-bit units.                              |             | WAIT                  |
| P67        |       | Use of an on-chip pull-up resistor can be specified by a software setting. |             | ASTB                  |

# (2) Non-port pins (1/2)

| Pin Name     | I/O    | Function  | After Reset | Alternate<br>Function |
|--------------|--------|---|-------------|-----------------------|
| INTP0        | Input  | External interrupt request input for which the valid edge (rising   | Input       | P00/TOFF7             |
| INTP1        |        | edge, falling edge, or both rising and falling edges) can be  | Input       | P01                   |
| INTP2        |        | specified   | Input       | P02                   |
| INTP3        |        |   | Input       | P03/ADTRG             |
| INTP4        |        |   | Input       | P54/TI000/TO00        |
| INTP5        |        |   | Input       | P55/TI010             |
| INTP6        |        |   | Input       | P56/TI001/TO01        |
| INTP7        |        |   | Input       | P57/TI011             |
| TI50         | Input  | External count clock input to 8-bit timer/event counter 50  | Input       | P24/TO50              |
| TI51         |        | External count clock input to 8-bit timer/event counter 51  | Input       | P25/TO51              |
| TI52         |        | External count clock input to 8-bit timer/event counter 52  | Input       | P26/TO52              |
| T1000        |        | External count clock input to 16-bit timer/event counter 00 Capture trigger input to capture register (CR000, CR010) in 16-bit timer/event counter 00 | Input       | P54/INTP4/TO00        |
| TI010        |        | Capture trigger input to capture register (CR000) in 16-bit timer /event counter 00   | Input       | P55/INTP5             |
| TI001        |        | External count clock input to 16-bit timer/event counter 01 Capture trigger input to capture register (CR001, CR011) in 16-bit timer/event counter 01 | Input       | P56/INTP6/TO01        |
| TI011        |        | Capture trigger input to capture register (CR001) in 16-bit timer /event counter 01   | Input       | P57/INTP7             |
| TO50         | Output | 8-bit timer/event counter 50 output   | Input       | P24/TI50              |
| TO51         |        | 8-bit timer/event counter 51 output   | Input       | P25/TI51              |
| TO52         |        | 8-bit timer/event counter 52 output   | Input       | P26/TI52              |
| TO00         |        | 16-bit timer/event counter 00 output  | Input       | P54/INTP4/TI000       |
| TO01         |        | 16-bit timer/event counter 01 output  | Input       | P56/INTP6/TI001       |
| RTP0 to RTP7 | Output | Real-time output port that outputs pulses in synchronization with trigger signals output from the real-time pulse unit                                | Input       | P30 to P37            |
| TxD00        | Output | Asynchronous serial interface serial data output  | Input       | P21                   |
| TxD01        |        |   | Input       | P23                   |
| RxD00        | Input  | Asynchronous serial interface serial data input   | Input       | P20                   |
| RxD01        |        |   | Input       | P22                   |
| SCK          | I/O    | Serial interface serial clock input/output  | Input       | P51                   |
| SI           | Input  | Serial interface serial data input  | Input       | P52                   |
| SO           | Output | Serial interface serial data output   | Input       | P53                   |
| ANI0 to ANI7 | Input  | A/D converter analog input  | Input       | P10 to P17            |
| ADTRG        | Input  | External trigger signal input to the A/D converter  | Input       | P03/INTP3             |
| TO70 to TO75 | Output | Timer output for the 3-phase PWM inverter control   | Hi-Z        | _                     |
| TOFF7        | Input  | External input to stop timer output (TO70 to TO75)  | Input       | P00/INTP0             |
| AD0 to AD7   | I/O    | Address/data bus for when memory is expanded externally   | Input       | P40 to P47            |
| RD           | Output | Strobe signal output for external memory read operation   | Input       | P64                   |
| WR           |        | Strobe signal output for external memory write operation  | Input       | P65                   |
| WAIT         | Input  | Wait insertion when accessing external memory   | Input       | P66                   |
| ASTB         | Output | Strobe output that externally latches address information output to ports 4 and 5 to access external memory   | Input       | P67                   |

# (2) Non-port pins (2/2)

| Pin Name             | I/O   | Function  | After Reset | Alternate<br>Function |
|----------------------|-------|---|-------------|-----------------------|

## 2.2 Description of Pin Functions

## 2.2.1 P00 to P03 (Port 0)

These pins constitute a 4-bit I/O port, port 0. In addition, these pins are also used to input external interrupt request signals, a timer output stop external signal and an external trigger signal of the A/D converter.

Port 0 can be set in the following operation modes in 1-bit units.

#### (1) Port mode

In this mode, P00 to P03 function as a 4-bit I/O port which can be set to input or output in 1-bit units by using port mode register 0 (PM0). An internal pull-up resistor can be used if so specified by pull-up resistor option register 0 (PU0).

## (2) Control mode

In this mode, P00 to P03 are used to input external interrupt requests, a timer output stop external signal, and an external trigger signal of the A/D converter.

## (a) INTP0 to INTP3

These pins are external interrupt request input pins for which the valid edge can be specified (rising edge, falling edge, and both rising and falling edges). INTP2 also functions as an external trigger signal input pin of the real-time output port when a valid edge is input.

## (b) TOFF7

External input pin to stop timer output (TO70 to TO75).

#### (c) ADTRG

External trigger signal input pin of the A/D converter.

## 2.2.2 P10 to P17 (Port 1)

These pins constitute an 8-bit input port, port 1. In addition to the general-purpose input port function, these pins also serve as the analog input pins of the A/D converter.

## (1) Port mode

In this mode, P10 to P17 function as an 8-bit input port.

## (2) Control mode

In this mode, P10 to P17 function as the analog input pins (ANI0 to ANI7) of the A/D converter.

#### 2.2.3 P20 to P26 (Port 2)

These pins constitute a 7-bit I/O port, port 2. In addition, these pins are also used as the serial interface I/O pins, and the timer I/O pins.

Port 2 can be set in the following operation modes in 1-bit units.

#### (1) Port mode

In this mode, P20 to P26 function as a 7-bit I/O port which can be set to input or output in 1-bit units by using port mode register 2 (PM2). An internal pull-up resistor can be used if so specified by pull-up resistor option register 2 (PU2).

#### (2) Control mode

In this mode, P20 to P26 function as the serial interface I/O pins, and timer I/O pins.

#### (a) RxD00, RxD01, TxD00, TxD01

Serial data I/O pins of the serial interface.

#### (b) TI50 to TI52

External count clock input pins of 8-bit timer/event counters 50 to 52.

## (c) TO50 to TO52

Output pins of 8-bit timer/event counters 50 to 52.

### 2.2.4 P30 to P37 (Port 3)

These pins constitute an 8-bit I/O port, port 3. In addition, they also function as a real-time output port. Port 3 can be set in the following operation modes in 1-bit units.

#### (1) Port mode

In this mode, P30 to P37 function as an 8-bit I/O port which can be set to input or output in 1-bit units by using port mode register 3 (PM3). An internal pull-up resistor can be used if so specified by pull-up resistor option register 3 (PU3).

## (2) Control mode

In this mode, P30 to P37 are used as a real-time output port (RTP0 to RTP7) that outputs data in synchronization with a trigger.

#### 2.2.5 P40 to P47 (Port 4)

These pins constitute an 8-bit I/O port, port 4. In addition, they also function as an address/data bus. Port 4 can be set in the following operation modes in 1-bit units.

## (1) Port mode

In this mode, P40 to P47 function as an 8-bit I/O port which can be set to input or output in 1-bit units by using port mode register 4 (PM4). An internal pull-up resistor can be used if so specified by pull-up resistor option register 4 (PU4).

#### (2) Control mode

In this mode, P40 to P47 function as the address/data bus pins (AD0 to AD7) in the external memory expansion mode.

#### 2.2.6 P50 to P57 (Port 5)

These pins constitute an 8-bit I/O port, port 5. In addition, these pins also function as the serial interface clock and I/O, data I/O, timer I/O, and external interrupt request input pins.

These pins can directly drive LEDs.

Port 5 can be set in the following operation modes in 1-bit units.

#### (1) Port mode

In this mode, P50 to P57 function as an 8-bit I/O port which can be set to input or output in 1-bit units by using port mode register 5 (PM5). An internal pull-up resistor can be used if so specified by pull-up resistor option register 5 (PU5).

#### (2) Control mode

In this mode, P50 to P57 function as the serial interface clock and data I/O, timer I/O and external interrupt request input pins.

#### (a) SCK

Serial interface's serial clock I/O pins.

#### (b) SI, SO

Serial interface's serial data I/O pins.

## (c) TI000, TI001

The pin that inputs the external counter clock to 16-bit timer/event counters 00 and 01 and the pin that inputs the capture trigger signal to the capture register of 16-bit timer/event counters 00 and 01.

#### (d) TI010 and TI011

The pins that input the capture trigger signal to the capture register of 16-bit timer/event counters 00 and 01.

## (e) TO00 and TO01

Output pins of 16-bit timer/event counters 00 and 01.

## (f) INTP4 to INTP7

External interrupt request input pins for which valid edges (rising edge, falling edge, and both rising and falling edges) can be specified.

## 2.2.7 P64 to P67 (Port 6)

These pins constitute a 4-bit I/O port, port 6, which can also be used to output control signals in the external memory expansion mode.

Port 6 can be set in the following operation modes in 1-bit units.

#### (1) Port mode

In this mode, P64 to P67 function as a 4-bit I/O port which can be set to input or output in 1-bit units by using port mode register 6 (PM6). An internal pull-up resistor can be used if so specified by pull-up resistor option register 6 (PU6).

#### (2) Control mode

In this mode, P64 to P67 function as control signal output pins ( $\overline{RD}$ ,  $\overline{WR}$ ,  $\overline{WAIT}$ , and ASTB) in the external memory expansion mode. The pins used as control signal output pins are automatically disconnected from internal pull-up resistors.

Caution If the external wait state is not used in the external memory expansion mode, P66 can be used as an I/O port pin.

### 2.2.8 TO70 to TO75

These are the timer output pins for 3-phase PWM inverter control.

#### 2.2.9 AVRFF

This pin inputs a reference voltage to the A/D converter.

Connect this pin to Vsso when the A/D converter is not used.

#### 2.2.10 AVDD

This is the analog power supply pin of the A/D converter.

Keep this pin at the same voltage as the VDD0 pin even when the A/D converter is not used.

## 2.2.11 AVss

This is the ground pin of the A/D converter.

Keep this pin at the same voltage as the Vsso pin even when the A/D converter is not used.

#### 2.2.12 **RESET**

This pin inputs an active-low system reset signal.

#### 2.2.13 X1 and X2

These pins are used to connect a crystal resonator for system clock oscillation.

To supply an external clock, input the clock to X1 and input the inverted signal to X2.

#### 2.2.14 VDD0 and VDD1

VDD0 is the positive power supply pin for ports.

V<sub>DD1</sub> is the positive power supply pin for blocks other than ports.

#### 2.2.15 Vsso and Vss1

Vsso is the ground pin for ports.

Vss1 is the ground pin for blocks other than ports.

## 2.2.16 V<sub>PP</sub> ( $\mu$ PD78F0988A only)

A high voltage should be applied to this pin when the program is written or verified.

Directly connect this pin to Vsso in the normal operation mode.

## 2.2.17 TEST (Mask ROM version only)

This pin is used for IC testing. Connect directly to Vsso.

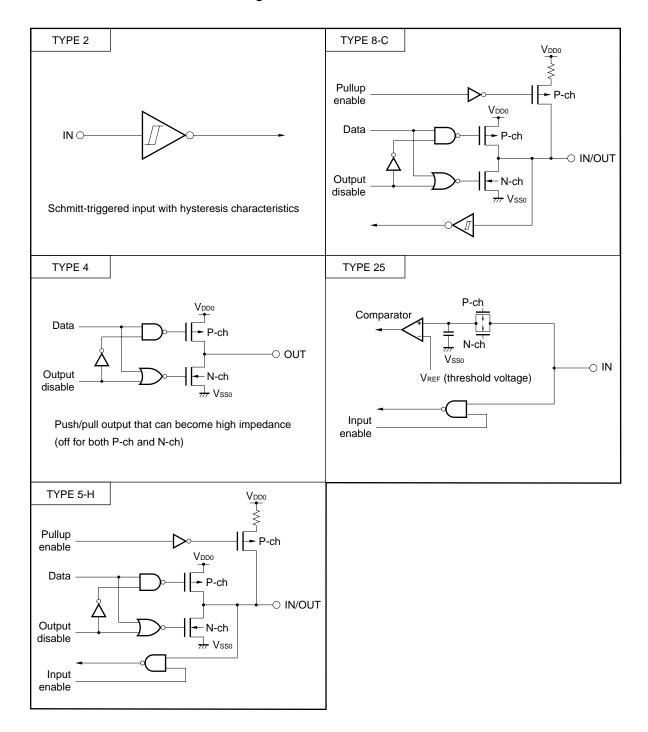

## 2.3 Pin I/O Circuits and Recommended Connection of Unused Pins

The I/O circuit type of each pin and recommended connections of unused pins are shown in Table 2-1. For each I/O circuit configuration, refer to Figure 2-1.

Table 2-1. Types of Pin I/O Circuits

| Pin Name                               | I/O Circuit Type | I/O    | Recommended Connection of Unused Pins                |
|--|------------------|--------|--|
| P00/INTP0/TOFF7                        | 8-C              | I/O    | Input: Independently connect to Vsso via a resistor. |
| P01/INTP1                              |                  |        | Output: Leave open.                                  |
| P02/INTP2                              |                  |        |  |
| P03/INTP3/ADTRG                        |                  |        |  |
| P10/ANI0 to P17/ANI7                   | 25               | Input  | Connect to VDD0 or Vsso.                             |
| P20/RxD00                              | 8-C              | I/O    | Input: Independently connect to VDD0 or VSS0 via a   |
| P21/TxD00                              | 5-H              |        | resistor.  |
| P22/RxD01                              | 8-C              |        | Output: Leave open.                                  |
| P23/TxD01                              | 5-H              |        |  |
| P24/TI50/TO50                          | 8-C              |        |  |
| P25/TI51/TO51                          |                  |        |  |
| P26/TI52/TO52                          |                  |        |  |
| P30/RTP0 to P37/RTP7                   | 5-H              |        |  |
| P40/AD0 to P47/AD7                     |                  |        |  |
| P50                                    |                  |        |  |
| P51/SCK                                | 8-C              |        |  |
| P52/SI                                 | 5-H              |        |  |
| P53/SO                                 |                  |        |  |
| P54/INTP4/TI000/TO00                   |                  |        |  |
| P55/INTP5/TI010                        |                  |        |  |
| P56/INTP6/TI001/TO01                   |                  |        |  |
| P57/INTP7/TI011                        |                  |        |  |
| P64/RD                                 |                  |        |  |
| P65/WR                                 |                  |        |  |
| P66/WAIT                               |                  |        |  |
| P67/ASTB                               |                  |        |  |
| TO70 to TO75                           | 4                | Output | Leave open.  |

## **CHAPTER 3 CPU ARCHITECTURE**

## 3.1 Memory Space

Each product in the  $\mu$ PD780988 Subseries can access a memory space of 64 KB. Figures 3-1 to 3-6 show the memory maps of the respective products.

Cautions 1. The initial value of the internal memory size switching register (IMS) is fixed (to CFH) for all the products in the  $\mu$ PD780988 Subseries, regardless of the capacity of the internal memory. Therefore, set the values shown below for each microcontroller before use.

μPD780982: C4H μPD780983: C6H μPD780984: C8H μPD780986: CCH

 $\mu$ PD780988: CFH (No need to change the initial value because the  $\mu$ PD780988 is set to

CFH.)

 $\mu$ PD78F0988A: Value corresponding to mask ROM versions

2. The initial value of the internal expansion RAM size switching register (IXS) is fixed (to 0CH) for all the products in the  $\mu$ PD780988 Subseries, regardless of the capacity of the internal expansion RAM. Therefore, set the values shown below for each microcontroller before use.

 $\mu\text{PD780982}, 780983, 780984\text{:}$  OCH (No need to change the initial value because the

 $\mu$ PD780982, 780983, 780984 are set to 0CH).

μ**PD780986**, **780988**: **OAH** 

 $\mu$ PD78F0988A: Value corresponding to mask ROM versions

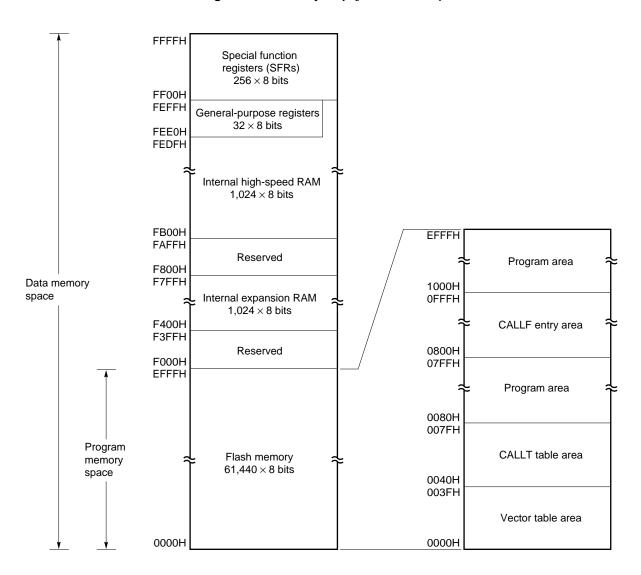

Figure 3-6. Memory Map ( $\mu$ PD78F0988A)

#### 3.1.1 Internal program memory space

The internal program memory space stores programs and table data. This space is usually addressed by the program counter (PC).

Each model in the µPD780988 Subseries is provided with the following internal ROM (or flash memory).

 Part Number
 Capacity

 Structure
 Structure

 μPD780982
 Mask ROM
 16,384 × 8 bits (0000H to 3FFFH)

 μPD780983
 23,775 × 8 bits (0000H to 5FFFH)

 μPD780984
 32,768 × 8 bits (0000H to 7FFFH)

 μPD780986
 49,152 × 8 bits (0000H to BFFFH)

Flash memory

Table 3-1. Internal ROM Capacity

The following areas are allocated to the internal program memory space.

μPD780988

μPD78F0988A

## (1) Vector table area

The 64-byte area of addresses 0000H to 003FH is reserved as a vector table area. This area stores program start addresses to which the program branches when the RESET signal is input or when an interrupt request is generated. Of a 16-bit program start address, the lower 8 bits are stored in an even address, and the higher 8 bits are stored in an odd address.

 $61,440 \times 8$  bits (0000H to EFFFH)

 $61,440 \times 8$  bits (0000H to EFFFH)

Vector Table Address Interrupt Source Vector Table Address Interrupt Source **RESET** input 0000H 001CH INTTM001 0004H INTWDT 001EH INTTM011 0006H INTP0 0020H INTSER0 0008H INTP1 0022H INTSR0 000AH INTP2 0024H INTST0 000CH INTP3 0026H INTSR1 000EH INTP4 0028H INTST1 0010H INTP5 002AH INTTM50 INTP6 002CH 0012H INTTM51 0014H INTP7 002EH INTTM52 0016H INTTM7 0030H **INTCSI3** 0018H INTTM000 0032H INTAD0 001AH INTTM010 003EH **BRK** instruction

Table 3-2. Vector Table

## (2) CALLT instruction table area

The subroutine entry address of a 1-byte call instruction (CALLT) can be stored in the 64-byte area of addresses 0040H to 007FH.

#### (3) CALLF instruction entry area

A subroutine can be directly called from the area of addresses 0800H to 0FFFH by using a 2-byte call instruction (CALLF).

## 3.1.2 Internal data memory space

The  $\mu$ PD780988 Subseries are provided with the following RAM.

#### (1) Internal high-speed RAM

The internal expansion RAM is allocated to the 1024-byte area FB00H to FEFFH. Four of these banks of general-purpose registers with eight 8-bit registers per bank are allocated to the 32-byte area FEE0H to FEFFH.

★ This area cannot be used as a program area in which instructions are written and executed.

The internal high-speed RAM can also be used as a stack memory.

## (2) Internal expansion RAM

In the  $\mu$ PD780986, 780988, and 78F0988A only, the internal expansion RAM is allocated to the 1024-byte area F400H to F7FFH.

★ The internal expansion RAM can also be used as a normal data area similar to the internal high-speed RAM, as well as a program area in which instructions can be written and executed.

### 3.1.3 Special function register (SFR) area

Special function registers (SFRs) of on-chip peripheral hardware are allocated to the area of FF00H to FFFFH (refer to Table 3-4 Special Function Register List in 3.2.3 Special function registers (SFRs)).

Caution Do not access an address to which no SFR is allocated.

#### 3.1.4 External memory space

This is an external memory space that can be accessed by setting the memory expansion mode register (MEM). This space can store programs and table data, and can be assigned to peripheral devices.

#### 3.1.5 Data memory addressing

The manner of specifying the address of the instruction to be executed next or specifying the address of a register or memory to be manipulated when an instruction is executed is called addressing.

The address of the instruction to be executed next is specified by the program counter (PC) (for details, refer to **3.3 Instruction Address Addressing**).

However, in consideration of operability, the  $\mu$ PD780988 Subseries is equipped with a wide range of addressing modes for memory addresses that are operational objects during instruction execution. Especially, in the areas to which the data memory is assigned (addresses FB00H to FFFFH), the special function registers (SFRs) and general-purpose registers can be addressed in accordance with their function. Figures 3-7 to 3-12 illustrate the addressing of the data memory.

For details of each addressing, refer to 3.4 Operand Address Addressing.

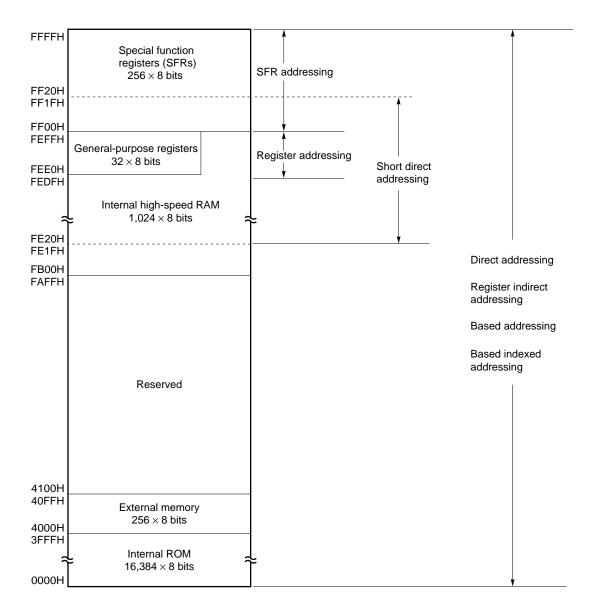

Figure 3-7. Data Memory Addressing ( $\mu$ PD780982)

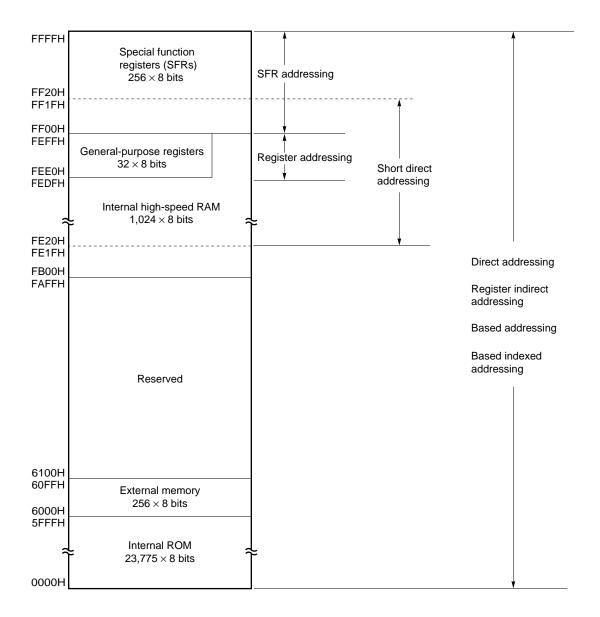

Figure 3-8. Data Memory Addressing ( $\mu$ PD780983)

## 3.2 Processor Registers

The  $\mu$ PD780988 Subseries is provided with the following processor registers.

#### 3.2.1 Control registers

Each of these registers has a dedicated function such as to control the program sequence, status, and stack memory. The control registers include the program counter (PC), program status word (PSW), and stack pointer (SP).

## (1) Program counter (PC)

The program counter is a 16-bit register that holds the address of the program to be executed next.

The contents of this register are automatically incremented according to the number of bytes of the instruction to be fetched when a normal operation is performed. When a branch instruction is executed, immediate data or the contents of a register are set to the program counter.

When the RESET signal is input, the value of the reset vector table at addresses 0000H and 0001H is set to the program counter.

Figure 3-13. Program Counter Configuration

## (2) Program status word (PSW)

The program status word is an 8-bit register consisting of flags that are set or reset as a result of instruction execution.

The contents of the program status word are automatically pushed to the stack when an interrupt request is generated or when the PUSH PSW instruction is executed, and are automatically popped from the stack when the RETB, RETI, or POP PSW instruction is executed.

The contents of the program status word are set to 02H when the RESET signal is input.

Figure 3-14. Program Status Word Configuration

### (a) Interrupt enable flag (IE)

This flag controls acknowledgement of an interrupt request by the CPU.

When IE = 0, all interrupt requests except the non-maskable interrupt are disabled (DI status).

When IE = 1, interrupts are enabled (EI status). At this time, acknowledgement of interrupt requests is controlled with an in-service priority flag (ISP), an interrupt mask flag for various interrupt sources, and a priority specification flag.

The interrupt enable flag is reset to 0 when the DI instruction is executed or when an interrupt request is acknowledged, and set to 1 when the EI instruction is executed.

#### (b) Zero flag (Z)

This flag is set to 1 when the result of an operation performed is 0; otherwise, it is reset to 0.

### (c) Register bank select flags (RBS0 and RBS1)

These 2-bit flags select one of the four register banks.

2-bit information indicating the register bank selected by execution of the "SEL RBn" instruction is stored in these flags.

## (d) Auxiliary carry flag (AC)

This flag is set to 1 when a carry from or a borrow to bit 3 occurs as a result of an operation; otherwise, it is reset to 0.

### (e) In-service priority flag (ISP)

This flag controls the priority of maskable vectored interrupts that can be acknowledged. When ISP = 0, the vectored interrupt request whose priority is specified by the priority specification flag registers (PR0L, PR0H, PR1L) (refer to 14.3 (3) Priority specification flag registers (PR0L, PR0H, PR1L)) to be low is disabled. Whether the interrupt request is actually acknowledged is controlled by the status of the interrupt enable flag (IE).

### (f) Carry flag (CY)

This flag records an overflow or underflow that occurs as the result of executing an add or subtract instruction. It also records the value shifted out when a rotate instruction is executed and functions as a bit accumulator when a bit operation instruction is executed.

## (3) Stack pointer (SP)

This is a 16-bit register that holds the first address of the stack area in the memory. Only the internal high-speed RAM area (FB00H to FEFFH) can be specified as the stack area.

Figure 3-15. Stack Pointer Configuration

The contents of the stack pointer are decremented when data is written (saved) to the stack memory, and incremented when data is read (restored) from the stack memory.

The data saved/restored as a result of each stack operation is as shown in Figures 3-16 and 3-17.

Caution The contents of the SP become undefined when the RESET signal is input. Be sure to initialize the SP before executing an instruction.

Figure 3-16. Data Saved to Stack Memory

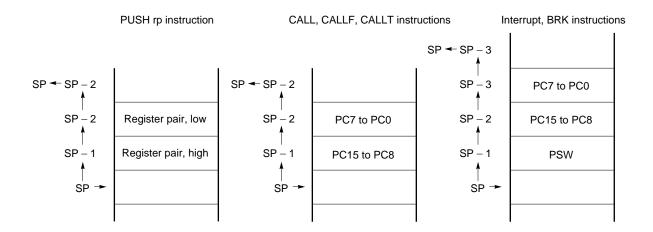

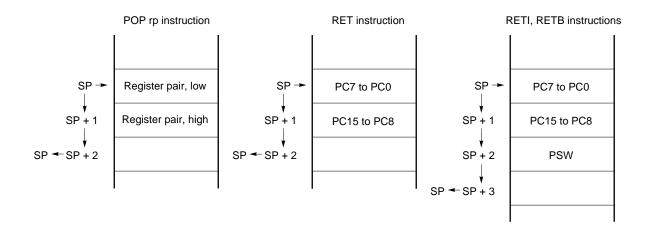

Figure 3-17. Data Restored from Stack Memory

#### 3.2.2 General-purpose registers

General-purpose registers are mapped to specific addresses of the data memory (FEE0H to FEFFH). Four banks of general-purpose registers, each consisting of eight 8-bit registers (X, A, C, B, E, D, L, and H) are available.

Each register can be used as an 8-bit register. Moreover, 8-bit registers can be used in pairs as 16-bit registers (AX, BC, DE, and HL).

Each register can be described not only by a function name (X, A, C, B, E, D, L, H, AX, BC, DE, or HL) but also by an absolute name (R0 to R7, RP0 to RP3).

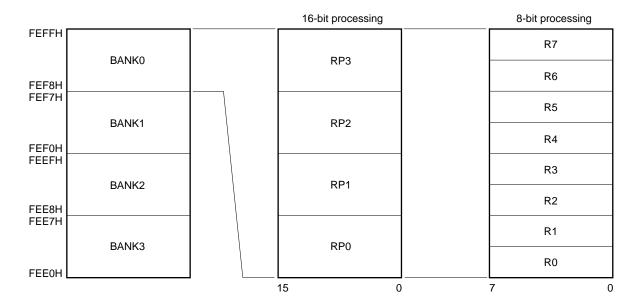

The register bank used for instruction execution is set by the CPU control instruction (SEL RBn). Because four register banks are provided, an efficient program can be developed by using one register bank for ordinary processing and another bank for interrupt servicing.

Table 3-3. Absolute Addresses of General-Purpose Registers

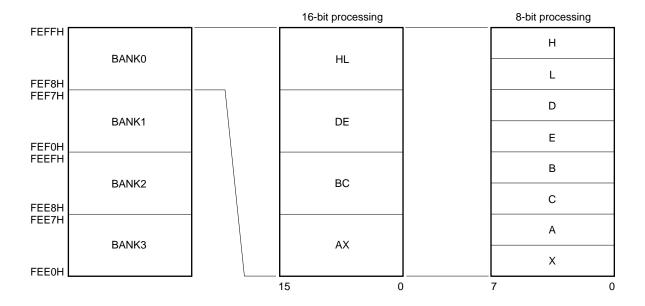

|           | Reg              | ister            | Absolute |           | Reg              | ister            | Absolute |

## (b) Function name

#### 3.2.3 Special function registers (SFRs)

Unlike the general-purpose registers, special function registers have their own functions and are allocated to the area of addresses FF00H to FFFFH.

The special function registers can also be manipulated in the same manner as the general-purpose registers by using operation, transfer, and bit manipulation instructions. The bit units in which one register is to be manipulated (1, 8, or 16 bits) differ from those of another register.

The bit unit for manipulation is specified as follows:

## • 1-bit manipulation

A symbol reserved by the assembler is described as the operand (sfr.bit) of a 1-bit manipulation instruction. An address can also be specified.

#### • 8-bit manipulation

A symbol reserved by the assembler is described as the operand (sfr) of an 8-bit manipulation instruction. An address can also be specified.

## • 16-bit manipulation

A symbol reserved by the assembler is described as the operand (sfrp) of a 16-bit manipulation instruction. When specifying an address, describe an even address.

Table 3-4 lists the special function registers. The meanings of the symbols in this table are as follows:

### Symbol

These symbols indicate the addresses of the special function registers.

They are reserved words for the RA78K0 and defined by header file sfrbit.h for the CC78K0. These symbols can be described as the operands of instructions when the RA78K0, ID78K0-NS, ID78K0, and SM78K0 are used.

#### R/W

Indicates whether the special function register in question can be read or written.

R/W: Read/writeR: Read onlyW: Write only

## · Bit unit for manipulation

" $\sqrt{}$ " indicates the manipulatable bit unit (1, 8, or 16). "—" indicates the bit units for which manipulation is not possible.

#### · After reset

Indicates the status of the special function register when the RESET signal is input.

Table 3-4. Special Function Register List (1/4)

| Address | Special Function Register (SFR) Name | Sy    | mbol   | R/  | W   | Bit Unit  | t for Mani | pulation | After Reset |

**Notes** 1. The initial value is CFH, but set and operate each microcontroller with the values shown below.

μPD780982: C4H μPD780983: C6H μPD780984: C8H μPD780986: CCH

 $\mu$ PD780988: CFH (No need to change the initial value because the  $\mu$ PD780988 is set to CFH).

 $\mu$ PD78F0988A: Value corresponding to those of mask ROM versions

2. The initial value is 0CH, but set and operate each microcontroller with the values shown below.

 $\mu\text{PD780982},\,780983,\,780984\colon$  0CH (No need to change the initial value because the  $\mu\text{PD780982},$ 

780983, 780984 are set to 0CH).

*μ*PD780986, 780988: 0AH

 $\mu$ PD78F0988A: Value corresponding to mask ROM versions

## 3.3 Instruction Address Addressing

An instruction address is determined by the contents of the program counter (PC). The contents of the PC are usually automatically incremented by the number of bytes of the instruction to be fetched (by 1 per byte) every time an instruction is executed. When an instruction that causes program execution to branch is performed, the address information of the branch destination is set to the PC by means of the following addressing (for details of each instruction, refer to **78K/0 Series User's Manual Instructions (U12326E)**).

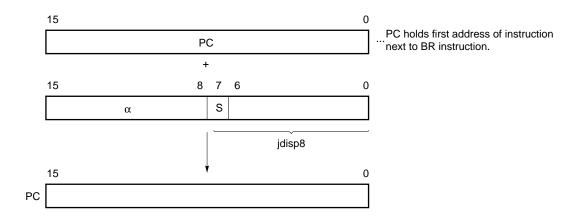

# 3.3.1 Relative addressing

#### [Function]

The 8-bit immediate data (displacement value: jdisp8) of the instruction code is added to the first address of the next instruction, the resultant sum is transferred to the program counter (PC), and program execution branches. The displacement value is treated as signed 2's complement data (-128 to +127), and bit 7 serves as a sign bit. In other words, relative addressing consists of relative branching from the first address of the following instruction to the -128 to +127 range.

This addressing is used when the "BR \$addr16" instruction or conditional branch instruction is executed.

# [Operation]

When S = 0, all bits of  $\alpha$  are 0. When S = 1, all bits of  $\alpha$  are 1.

## 3.3.2 Immediate addressing

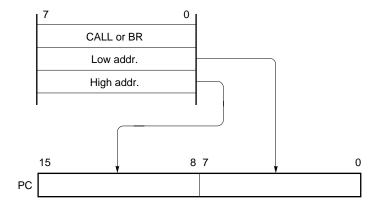

# [Function]

The immediate data in an instruction word is transferred to the program counter (PC), and program execution branches.

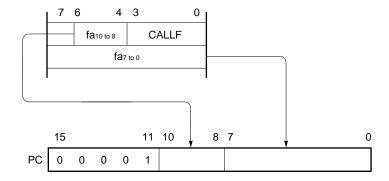

This addressing is used when the "CALL !addr16", "BR !addr16", or "CALLF !addr11" instruction is executed. The CALL !addr16 and BR !addr16 instructions allow the program to branch to the entire memory space. The CALLF !addr11 instruction allows the program to branch to the 0800H to 0FFFH area.

# [Operation]

When the "CALL !addr16" or "BR !addr16" instruction is executed

When the "CALLF !addr11" instruction is executed

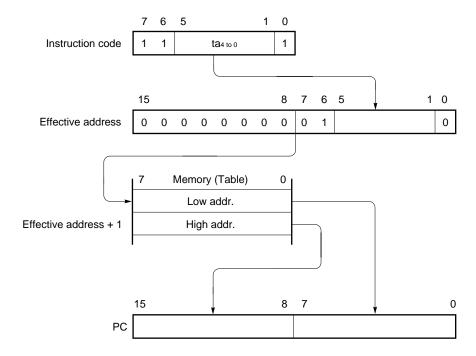

## 3.3.3 Table indirect addressing

# [Function]

The contents of a specific location table (branch destination address) addressed by the immediate data of bits 1 to 5 of an instruction code are transferred to the program counter (PC), and program execution branches. This addressing is used when the "CALLT [addr5]" instruction is executed. This instruction references the addresses stored in the memory table from 40H to 7FH, and allows the program to branch to the entire memory space.

# [Operation]

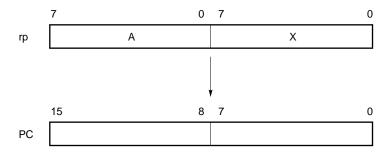

# 3.3.4 Register addressing

# [Function]

The contents of the register pair (AX) specified by an instruction word are transferred to the program counter (PC), and program execution branches.

This addressing is used when the "BR AX" instruction is executed.

# [Operation]

# 3.4 Operand Address Addressing

The following methods are available to specify the register and memory (addressing) to undergo manipulation during instruction execution.

# 3.4.1 Implied addressing

## [Function]

This addressing is used to automatically (implicitly) address a register that functions as an accumulator (A or AX) in the general-purpose register area.

The instruction words of the  $\mu$ PD780988 Subseries that use implied addressing are as follows.

| Instruction | Register Specified by Implied Addressing                              |  |  |  |  |  |  |
|-------------|---|--|--|--|--|--|--|
| MULU        | ULU Register A to store multiplicand and register AX to store product |  |  |  |  |  |  |
| DIVUW       | Register AX to store dividend and quotient                            |  |  |  |  |  |  |
| ADJBA/ADJBS | Register A to store numeric value subject to decimal adjustment       |  |  |  |  |  |  |
| ROR4/ROL4   | Register A to store digit data subject to digit rotation              |  |  |  |  |  |  |

# [Operand Format]

No specific operand format is used because the operand format is automatically determined by the instruction.

# [Example]

# MULU X

The product between registers A and X is stored in register AX as a result of executing the multiply instruction of 8 bits  $\times$  8 bits. In this operation, registers A and AX are specified by implied addressing.

## 3.4.2 Register addressing

### [Function]

This addressing is used to access a general-purpose register as an operand. The general-purpose register to be accessed is specified by the register bank select flags (RBS0 and RBS1) and with the register specification code (Rn and RPn) in an instruction code.

Register addressing is used when an instruction that has the following operand format is executed. When an 8-bit register is specified, one of the eight registers is specified by 3 bits in the instruction code.

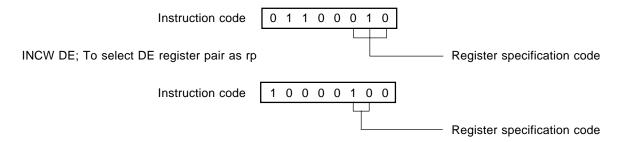

## [Operand Format]

| Representation | Description            |  |  |  |  |
|----------------|------------------------|--|--|--|--|
| r              | X, A, C, B, E, D, L, H |  |  |  |  |
| rp             | AX, BC, DE, HL         |  |  |  |  |

r and rp can be described not only by a function name (X, A, C, B, E, D, L, H, AX, BC, DE, or HL) but also by an absolute name (R0 to R7, RP0 to RP3).

## [Example]

MOV A, C; To select C register as r

# 3.4.3 Direct addressing

# [Function]

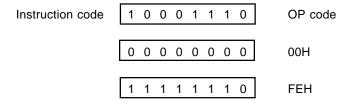

The addressing is used to directly address the memory indicated by the immediate data in an instruction word.

# [Operand Format]

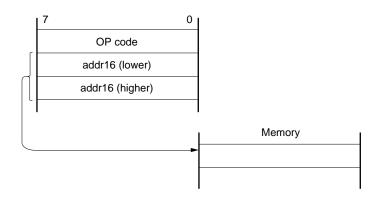

| Representation | Description                    |
|----------------|--------------------------------|
| addr16         | Label or 16-bit immediate data |

# [Example]

MOV A, !0FE00H; To specify FE00H as !addr16

# [Operation]

#### 3.4.4 Short direct addressing

### [Function]

This addressing directly addresses a memory area to be manipulated from a fixed space by using the 8-bit data in an instruction word.

This addressing is applicable to the fixed 256-byte space of FE20H to FF1FH. The internal high-speed RAM is mapped to addresses FE20H to FEFFH, and special function registers (SFRs) are mapped to addresses FF00H to FF1FH.

The SFR area (FF00H to FF1FH) to which short direct addressing is applied is a part of the entire SFR area. Ports that are frequently accessed in the program, and compare and capture registers of timer/event counters are mapped to the SFR area. These SFRs can be manipulated with a few bytes and clocks.

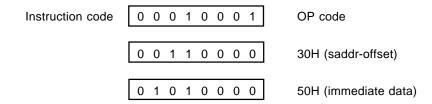

Bit 8 of the effective address is 0 if the 8-bit immediate data is in the range of 20H to FFH, and 1 if the data is in the range of 00H to 1FH. Refer to [Operation].

#### [Operand Format]

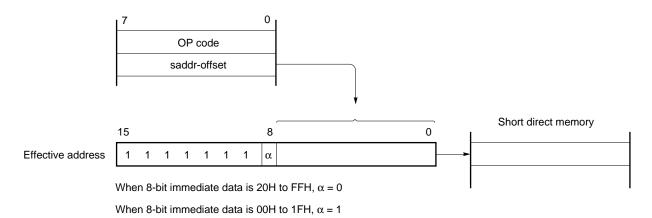

| Representation | Description  |  |  |  |  |  |  |
|----------------|--|--|--|--|--|--|--|
| saddr          | Label or immediate data FE20H to FF1FH                     |  |  |  |  |  |  |
| saddrp         | Label or immediate data FE20H to FF1FH (even address only) |  |  |  |  |  |  |

## [Example]

MOV 0FE30H, #50H; To specify FE30H as saddr and 50H as immediate data

## [Operation]

80

### 3.4.5 Special function register (SFR) addressing

# [Function]

This addressing is to address special function registers (SFRs) mapped to the memory by using the 8-bit immediate data in an instruction word.

This addressing is applied to the 240-byte space of FF00H to FFCFH and FFE0H to FFFFH. However, the SFRs mapped to the area of FF00H to FF1FH can also be accessed by means of short direct addressing.

# [Operand Format]

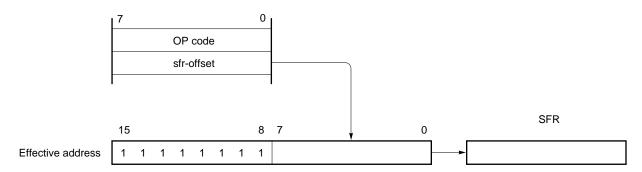

| Representation | Description   |  |  |  |  |  |  |
|----------------|---|--|--|--|--|--|--|
| sfr            | Special function register name  |  |  |  |  |  |  |
| sfrp           | Name of special function register that can be manipulated in 16-bit units (even address only) |  |  |  |  |  |  |

# [Example]

MOV PM0, A; To select PM0 (FF20H) as sfr

# [Operation]

## 3.4.6 Register indirect addressing

# [Function]

This addressing is used to address memory using the contents of a specified register pair as an operand. The register pair to be accessed is specified by the register bank select flags (RBS0 and RBS1) and the register pair specification code in an instruction code. This addressing can address the entire memory space.

# [Operand Format]

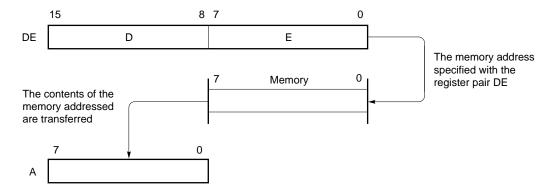

| Representation | Description |
|----------------|-------------|
| _              | [DE], [HL]  |

# [Example]

MOV A, [DE]; To select [DE] as register pair

# [Operation]

## 3.4.7 Based addressing

# [Function]

This addressing is used to address the memory by using the result of adding 8-bit immediate data to the contents of the HL register pair used as a base register. The HL register pair to be accessed is in the register bank specified by the register bank select flags (RBS0 and RBS1). The addition is executed by extending the offset data to 16 bits as a positive number. A carry from the 16th bit is ignored. This addressing can address the entire memory space.

# [Operand Format]

| Representation | Description |  |  |  |  |
|----------------|-------------|--|--|--|--|
| _              | [HL + byte] |  |  |  |  |

# [Example]

MOV A, [HL + 10H]; To specify 10H as byte

Instruction code | 1 0 1 0 1 1 1 0

0 0 0 1 0 0 0 0

#### 3.4.8 Based indexed addressing

### [Function]

This addressing is used to address the memory by using the result of adding the contents of the B or C register specified in the instruction word to the contents of the HL register used as a base register. The HL, B, and C registers accessed are in the register bank specified by the register bank select flags (RBS0 and RBS1). The addition is executed with the contents of the B or C register extended to 16 bits as a positive number. A carry from the 16th bit is ignored.

This addressing can address the entire memory space.

### [Operand Format]

| Representation | Description        |  |  |  |  |  |
|----------------|--------------------|--|--|--|--|--|
| _              | [HL + B], [HL + C] |  |  |  |  |  |

#### [Example]

When MOV A, [HL + B]

Instruction code 1 0 1 0 1 0 1 1

### 3.4.9 Stack addressing

## [Function]

This addressing is used to indirectly address the stack area by using the contents of the stack pointer (SP). This addressing is automatically used to save/restore register contents when the PUSH, POP, subroutine call, or return instruction is executed, or when an interrupt request is generated.

Stack addressing can access the internal high-speed RAM area only.

# [Example]

When PUSH DE is executed

Instruction code | 1 0 1 1 0 1 0 1

# **CHAPTER 4 PORT FUNCTIONS**

# 4.1 Function of Ports

The  $\mu$ PD780988 Subseries is provided with eight input port pins and 39 I/O port pins. Figure 4-1 shows these port pins. Each port can be manipulated in 1-bit or 8-bit units and controlled in various ways. Moreover, some port pins also serve as the I/O pins of the internal hardware.

P40 P00 Port 0 P03 Port 4 P10 to P17 Port 1 P20 P47 P50 Port 2 P26 Port 5 P30 P57 Port 3 P64 Port 6 P67 P37

Figure 4-1. Types of Ports

Table 4-1. Port Functions

| Pin Name |            | Function  | Alternate Function |
|----------|------------|---|--------------------|
| Port 0   | P00        | 4-bit I/O port  | INTP0/TOFF7        |
|          | P01        | Input/output can be specified in 1-bit units.   | INTP1              |

# 4.2 Configuration of Ports

A port consists of the following hardware.

**Table 4-2. Port Configuration** 

|                   | Item  | Configuration   |  |  |  |  |
|-------------------|-------|---|--|--|--|--|
| Control registers |       | Port mode register (PM0, PM2 to PM6) Pull-up resistor option register (PU0, PU2 to PU6) |  |  |  |  |
| Ports             | Total | 47  |  |  |  |  |
|                   | Input | 8   |  |  |  |  |
|                   | I/O   | 39  |  |  |  |  |
| Pull-up resistors |       | 39 (software control)   |  |  |  |  |

#### 4.2.1 Port 0

This is a 4-bit I/O port with output latches. Port 0 can be set in the input or output mode in 1-bit units via port mode register 0 (PM0). When using port 0, internal pull-up resistors can be connected in 1-bit units by using pull-up resistor option register 0 (PU0).

Alternate functions include external interrupt request input, external input to stop timer output, and an external trigger signal for the A/D converter.

RESET input sets port 0 to input mode.

Figure 4-2 shows the block diagram of port 0.

Caution Because port 0 is also used as an external interrupt request input, an interrupt request flag is set when the port is set in the output mode and its output level is changed. When using port 0 in the output mode, therefore, set the interrupt mask flag to 1.

### 4.2.2 Port 1

This is an 8-bit input port. Alternate functions include A/D converter analog input. Figure 4-3 shows the block diagram of port 1.

Figure 4-3. Block Diagram of P10 to P17

#### 4.2.3 Port 2

This is a 7-bit I/O port with output latches. Port 2 can be set in the input or output mode in 1-bit units via port mode register 2 (PM2). When using port 2, internal pull-up resistors can be connected in 1-bit units by using pull-up resistor option register 2 (PU2).

Alternate functions include serial interface data I/O and timer I/O.

RESET input sets port 2 to input mode.

Figure 4-4 shows the block diagram of port 2.

Caution When performing transmission using the serial interface or timer output, set the pins to be used to output mode, and set the output latch to 0.

When performing reception or timer input, set the pins to be used to input mode.

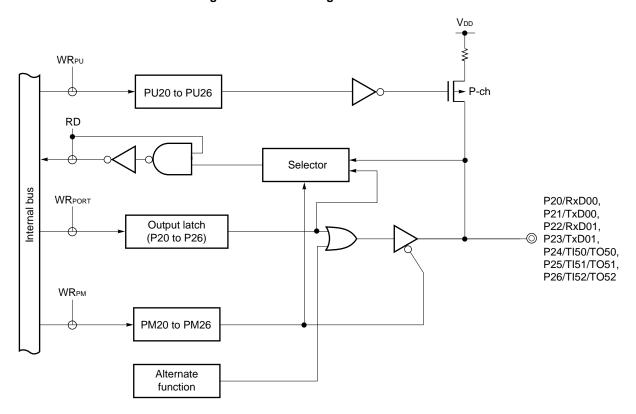

Figure 4-4. Block Diagram of P20 to P26

PU: Pull-up resistor option register

PM: Port mode register RD: Read signal of port 2 WR: Write signal of port 2

#### 4.2.4 Port 3

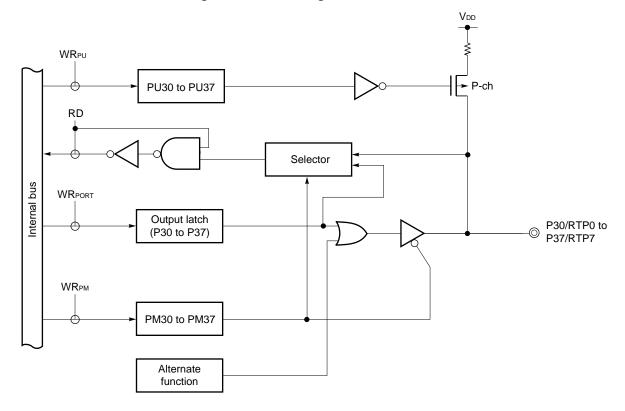

This is an 8-bit I/O port with output latches. Port 3 can be set in the input or output mode in 1-bit units via port mode register 3 (PM3). When using port 3, internal pull-up resistors can be connected in 1-bit units by using pull-up resistor option register 3 (PU3).

Alternate functions include use as a real-time output port.

RESET input sets port 3 to input mode.

Figure 4-5 shows the block diagram of port 3.

Figure 4-5. Block Diagram of P30 to P37

PU: Pull-up resistor option register

PM: Port mode register RD: Read signal of port 3

WR: Write signal of port 3

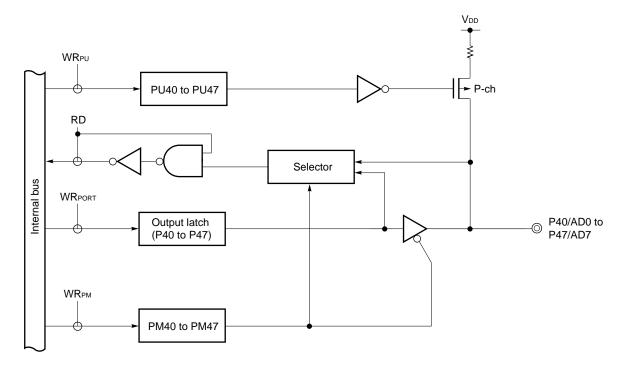

#### 4.2.5 Port 4

This is an 8-bit I/O port with output latches. Port 4 can be set in the input or output mode in 1-bit units via port mode register 4 (PM4). When using port 4, internal pull-up resistors can be connected in 1-bit units by using pull-up resistor option register 4 (PU4).

Alternate functions include an address/data bus function that is used in the external memory expansion mode. RESET input sets port 4 to input mode.

Figure 4-6 shows the block diagram of port 4.

Figure 4-6. Block Diagram of P40 to P47

PU: Pull-up resistor option register

PM: Port mode register
RD: Read signal of port 4
WR: Write signal of port 4

#### 4.2.6 Port 5

This is an 8-bit I/O port with output latches. Port 5 can be set in the input or output mode in 1-bit units via port mode register 5 (PM5). When using port 5, internal pull-up resistors can be connected in 1-bit units by using pull-up resistor option register 5 (PU5).

Port 5 can directly drive LEDs.

Alternate functions include serial interface clock and data I/O, timer I/O, and external interrupt request input.

RESET input sets port 5 to input mode.

Figures 4-7 and 4-8 show the block diagram of port 5.

Cautions 1. When performing transmission using the serial interface or timer output, set the pins to be used to output mode, and set the output latch to 0.

When performing reception or timer input, set the pins to be used to input mode.

2. Because pins P54 to P57 are also used as external interrupt request input pins, an interrupt request flag is set when the port is set in the output mode and its output level is changed. When using the output mode, therefore, set the interrupt mask flag to 1.

#### 4.2.7 Port 6

This is a 4-bit I/O port with output latches. Port 6 can be set in the input or output mode in 1-bit units via port mode register 6 (PM6). When using port 6, internal pull-up resistors can be connected in 1-bit units by using pull-up resistor option register 6 (PU6).

Alternate functions include a control signal output function in the external memory expansion mode.

RESET input sets port 6 to input mode.

Figure 4-9 shows the block diagram of port 6.

Caution P66 can be used as an I/O port pin when no external wait state is used in the external memory expansion mode.

## 4.3 Registers Controlling Port Functions

The following two types of registers control the ports.

- Port mode registers (PM0, PM2, PM3, PM4, PM5, PM6)
- Pull-up resistor option registers (PU0, PU2, PU3, PU4, PU5, PU6)

#### (1) Port mode registers (PM0, PM2, PM3, PM4, PM5, PM6)

These registers set the corresponding ports in the input or output mode in 1-bit units. PM0, PM2, PM3, PM4, PM5, and PM6 are manipulated by a 1-bit or 8-bit memory manipulation instruction. RESET input sets these registers to FFH.

- Cautions 1. Because port 0 and pins P54 to P57 are also used as external interrupt request input pins, interrupt request flags are set when the output mode of the port function is specified and the output level is changed. To use this port in the output mode, therefore, set the interrupt mask flags to 1 in advance.
  - 2. Since pull-up resistors will not be disconnected even if ports 0 and 2 to 6 are set to output mode, set corresponding pull-up resistor option registers to 0 when those ports are used in output mode.
  - 3. When a port pin that has an alternate function serves as an alternate function output pin, set its output latch to 0.

Figure 4-10. Format of Port Mode Register

(m = 6: n = 4 to 7)

Output mode (output buffer on)
Input mode (output buffer off)

## (2) Pull-up resistor option registers (PU0, PU2, PU3, PU4, PU5, PU6)

These registers set whether the internal pull-up resistor is connected to each port. By setting PU0 and PU2 to PU6, on-chip pull-up resistors corresponding to bits in PU0 and PU2 to PU6 can be used. PU0, PU2 to PU6 are individually set by a 1-bit or 8-bit memory manipulation instruction. RESET input clears these registers to 00H.

### Cautions 1. Port 1 is not provided with an on-chip pull-up resistor.

2. When PUm is set to 1, an on-chip pull-up resistor is connected regardless of whether the mode is input/output mode or external expansion mode. Accordingly, when using the port in output or external expansion mode, set the corresponding bit of PUm to 0 (m = 0, 2 to 6).

Figure 4-11. Format of Pull-up Resistor Option Register

#### 4.4 Operation of Port Functions

The operation of a port differs depending on whether the port is set in the input or output mode, as described below.

## 4.4.1 Writing to I/O port

#### (1) In output mode

A value can be written to the output latch of a port by using a transfer instruction. The contents of the output latch can be output from the pins of the port.

Data once written to the output latch is retained until new data is written to the output latch.

### (2) In input mode

A value can be written to the output latch by using a transfer instruction. However, the status of the port pin is not changed because the output buffer is off.

Data once written to the output latch is retained until new data is written to the output latch.

Caution A 1-bit memory manipulation instruction is executed to manipulate 1 bit of a port. However, this instruction accesses the port in 8-bit units. When this instruction is executed to manipulate a bit of an input/output port, therefore, the contents of the output latch of the pin that is set in the input mode and not subject to manipulation become undefined.

## 4.4.2 Reading from I/O port

### (1) In output mode

The contents of the output latch can be read by using a transfer instruction. The contents of the output latch are not changed.

# (2) In input mode

The status of a pin can be read by using a transfer instruction. The contents of the output latch are not changed.

### 4.4.3 Arithmetic operation of I/O port

### (1) In output mode

An arithmetic operation can be performed on the contents of the output latch. The result of the operation is written to the output latch. The contents of the output latch are output from the port pins.

Data once written to the output latch is retained until new data is written to the output latch.

# (2) In input mode

The contents of the output latch become undefined. However, the status of the pin is not changed because the output buffer is off.

Caution A 1-bit memory manipulation instruction is executed to manipulate 1 bit of a port. However, this instruction accesses the port in 8-bit units. When this instruction is executed to manipulate a bit of an input/output port, therefore, the contents of the output latch of the pin that is set in the input mode and not subject to manipulation become undefined.

# **CHAPTER 5 CLOCK GENERATOR**

### **★ 5.1 Function of Clock Generator**

The clock generator generates the clock to be supplied to the CPU and peripheral hardware. Oscillation can be stopped by executing the STOP instruction.

- Expanded-specification products
   The system oscillator oscillates a frequency of 1.0 to 12.0 MHz.
- Conventional products
   The system oscillator oscillates a frequency of 1.0 to 8.38 MHz.

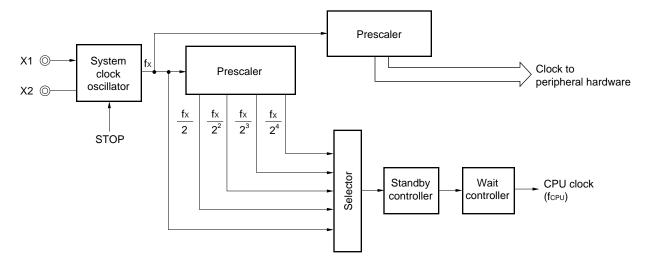

# 5.2 Configuration of Clock Generator

The clock generator includes the following hardware.

Table 5-1. Configuration of Clock Generator

| Item             | Configuration                          |  |  |  |  |
|------------------|--|--|--|--|--|
| Control register | Processor clock control register (PCC) |  |  |  |  |
| Oscillator       | System clock oscillator                |  |  |  |  |

Figure 5-1. Clock Generator Block Diagram

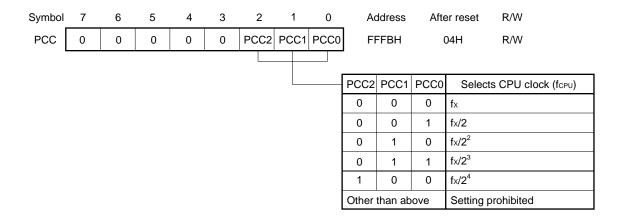

### 5.3 Register Controlling Clock Generator

The clock generator is controlled by the processor clock control register (PCC). This register selects the CPU clock. PCC is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets this register to 04H.

Figure 5-2. Format of Processor Clock Control Register

Caution Be sure to clear bits 3 to 7 to 0.

Remark fx: System clock oscillation frequency

The fastest instruction of the  $\mu$ PD780988 Subseries is executed in two CPU clocks. Therefore, the relationship between the CPU clock (fcpu) and the minimum instruction execution time is as shown in Table 5-2.

Table 5-2. Relationship Between CPU Clock and Minimum Instruction Execution Time

| CPU Clock (fcpu)  | Minimum Instruction Execution Time: 2/fcpu |                  |  |  |  |  |  |
|-------------------|--|------------------|--|--|--|--|--|
|                   | At fx = 12 MHz <sup>Note</sup>             | At fx = 8.38 MHz |  |  |  |  |  |
| fx                | 0.166 μs                                   | 0.238 μs         |  |  |  |  |  |
| fx/2              | 0.33 μs                                    | 0.48 μs          |  |  |  |  |  |
| fx/2 <sup>2</sup> | 0.66 μs                                    | 0.96 μs          |  |  |  |  |  |
| fx/2 <sup>3</sup> | 1.3 μs                                     | 1.9 μs           |  |  |  |  |  |
| fx/2 <sup>4</sup> | 2.6 μs                                     | 3.8 μs           |  |  |  |  |  |

Note Expanded-specification products only.

Remark fx: System clock oscillation frequency

## 5.4 System Clock Oscillators

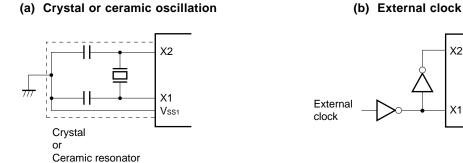

#### 5.4.1 System clock oscillator

★ The system clock oscillator is oscillated by the crystal or ceramic resonator (12 MHz TYP.) connected across the X1 and X2 pins.

An external clock can also be input to the circuit. In this case, input the clock signal to the X1 pin, and input the inverted signal to the X2 pin.

Figure 5-3 shows the external circuit of the system clock oscillator.

Figure 5-3. External Circuit of System Clock Oscillator

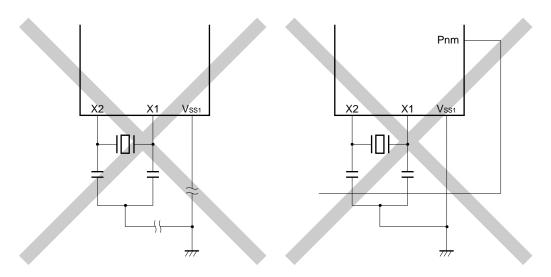

- Cautions 1. The STOP instruction cannot be executed when the external clock is input. This is because if the STOP instruction is executed, the system clock operation is stopped, and the X2 pin is pulled up to V<sub>DD1</sub>.
  - 2. When using the system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.
    - · Keep the wiring length as short as possible.
    - Do not cross the wiring with the other signal lines.
    - Do not route the wiring near a signal line through which a high fluctuating current flows.
    - Always make the ground point of the oscillator capacitor the same potential as Vss1. Do not ground the capacitor to a ground pattern through which a high current flows.
    - · Do not fetch signals from the oscillator.

Figure 5-4 shows examples of incorrect resonator connection.

Figure 5-4. Examples of Incorrect Resonator Connection (1/2)

(a) Too long wiring

(b) Crossed signal line

- (c) Wiring near high fluctuating current
- (d) Current flowing through ground line of oscillator (potential at points A, B, and C fluctuates)

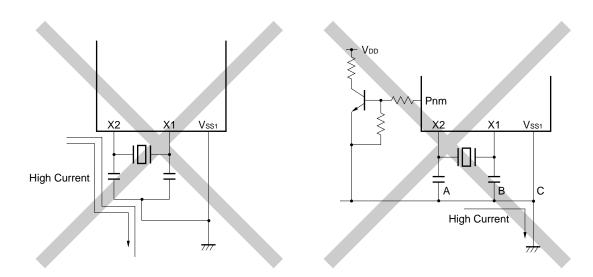

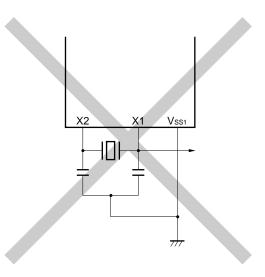

Figure 5-4. Examples of Incorrect Resonator Connection (2/2)

(e) Signal is fetched

# 5.4.2 Divider

The divider divides the output of the system clock oscillator (fx) to generate various clocks.

## 5.5 Operation of Clock Generator

The clock generator generates the following clocks and controls the operation modes of the CPU, such as the standby mode.

- System clock fx
- CPU clock fcpu
- · Clock to peripheral hardware

The operation of the clock generator is determined by the processor clock control register (PCC), as follows.

- \* (a) The slowest mode (2.6 μs @ 12 MHz operation, 3.8 μs @ 8.38 MHz operation) of the system clock is selected when the RESET signal is generated (PCC = 04H). While a low level is input to the RESET pin, oscillation of the system clock is stopped.
- \* (b) Five types of minimum instruction execution time (0.166  $\mu$ s, 0.33  $\mu$ s, 0.66  $\mu$ s, 1.3  $\mu$ s, and 2.6  $\mu$ s @ 12 MHz operation/0.238  $\mu$ s, 0.48  $\mu$ s, 0.96  $\mu$ s, 1.9  $\mu$ s, and 3.8  $\mu$ s @ 8.38 MHz operation) can be selected via a PCC setting when the system clock is in the selected state.
  - (c) Two standby modes, STOP and HALT, can be used.
  - (d) The clock to the peripheral hardware is supplied by dividing the system clock. Therefore, the other peripheral hardware is stopped when the system clock is stopped (except, however, the external clock input operation).

# 5.6 Changing Setting of CPU Clock

# 5.6.1 Time required for switching CPU clock

The CPU clock can be selected by using bits 0 to 2 (PCC0 to PCC2) of the processor clock control register (PCC). Actually, the specified clock is not selected immediately after the setting of PCC has been changed, and the old clock is used for the duration of several instructions after that (refer to **Table 5-3**).

Table 5-3. Maximum Time Required for Switching CPU Clock

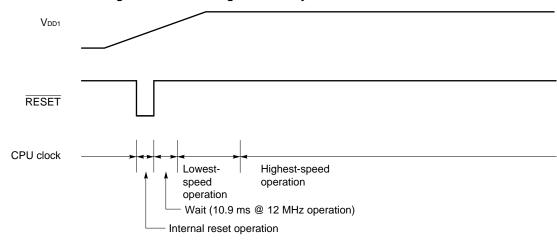

| Set Value Before<br>Switching |                 |      |                |      |                 | Set Value After Switching |                 |                |               |                 |                |               |                 |                |      |      |      |
|-------------------------------|-----------------|------|----------------|------|-----------------|---------------------------|-----------------|----------------|---------------|-----------------|----------------|---------------|-----------------|----------------|------|------|------|
| PCC2                          | PCC1            | PCC0 | PCC2           | PCC1 | PCC0            | PCC2                      | PCC1            | PCC0           | PCC2          | PCC1            | PCC0           | PCC2          | PCC1            | PCC0           | PCC2 | PCC1 | PCC0 |
| F002                          | 002   P001   P0 | PCCU | 0              | 0    | 0               | 0                         | 0               | 1              | 0             | 1               | 0              | 0             | 1               | 1              | 1    | 0    | 0    |
| 0                             | 0               | 0    |                |      | 16 instructions |                           | 16 instructions |                |               | 16 instructions |                |               | 16 instructions |                |      |      |      |
| 0                             | 0               | 1    | 8 instructions |      |                 |                           |                 | 8 instructions |               |                 | 8 instructions |               |                 | 8 instructions |      |      |      |
| 0                             | 1               | 0    | 4 instructions |      |                 | 4 instructions            |                 |                |               |                 | 4 instructions |               |                 | 4 instructions |      |      |      |
| 0                             | 1               | 1    | 2 instructions |      |                 | 2 instructions            |                 | 2 instructions |               |                 |                |               |                 | 2 instructions |      |      |      |
| 1                             | 0               | 0    | 1 instruction  |      |                 | 1 instruction             |                 |                | 1 instruction |                 |                | 1 instruction |                 |                |      |      |      |

Remark One instruction is the minimum instruction execution time of the CPU clock before switching.

## 5.6.2 Switching CPU clock

The following figure illustrates how the CPU clock is switched.

Figure 5-5. Switching Between System Clock and CPU Clock

- <1> The CPU is reset when the RESET pin is made low on power application. The effect of resetting is released when the RESET pin is later made high, and the system clock starts oscillating. At this time, the time during which oscillation stabilizes (2<sup>17</sup>/fx) is automatically secured.
  - After that, the CPU starts instruction execution at the slowest speed of the system clock (2.6  $\mu$ s @ 12 MHz operation, 3.8  $\mu$ s @ 8.38 MHz operation).
- <2> After the time during which the VDD1 voltage rises to the level at which the CPU can operate at the highest speed has elapsed, processor clock control register (PCC) is rewritten so that the highest speed can be selected.

\*

### **CHAPTER 6 16-BIT TIMER/EVENT COUNTER**

### 6.1 Outline of 16-Bit Timer/Event Counter

A 16-bit timer/event counter can be used as an interval timer, for PPG output, pulse width measurement (infrared remote control receive function), as an external event counter, or for square-wave output of any frequency.

# 6.2 Function of 16-Bit Timer/Event Counter

The 16-bit timer/event counters have the following functions.

- Interval timer
- PPG output
- · Pulse width measurement
- · External event counter
- · Square-wave output

### (1) Interval timer

TM0n generates interrupt requests at the preset time interval.

# (2) PPG output

TM0n can output a square wave whose frequency and output pulse can be set freely.

### (3) Pulse width measurement

TM0n can measure the pulse width of an externally input signal.

## (4) External event counter

TM0n can measure the number of pulses of an externally input signal.

# (5) Square-wave output

TM0n can output a square wave with any selected frequency.

# 6.3 Configuration of 16-Bit Timer/Event Counter

A 16-bit timer/event counter includes the following hardware.

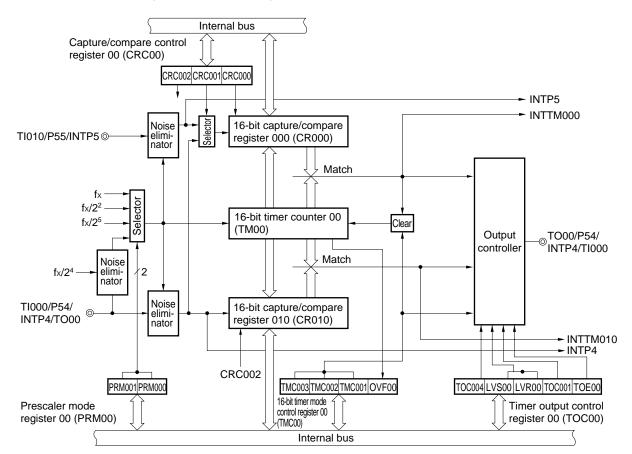

Table 6-1. Configuration of 16-Bit Timer/Event Counter

| Item             | Configuration  |
|------------------|--|
| Timer register   | 16-bit timer counter 0n (TM0n)   |
| Register         | 16-bit capture/compare register 00n, 01n (CR00n, CR01n)  |
| Timer output     | TO0n   |
| Control register | 16-bit timer mode control register 0n (TMC0n) Capture/compare control register 0n (CRC0n) Timer output control register 0n (TOC0n) Prescaler mode register 0n (PRM0n) Port mode register 5 (PM5)Note |

Note Refer to Figure 4-8 Block Diagram of P51 to P57.

Remark n = 0, 1

Figure 6-1. Block Diagram of 16-Bit Timer/Event Counter 00

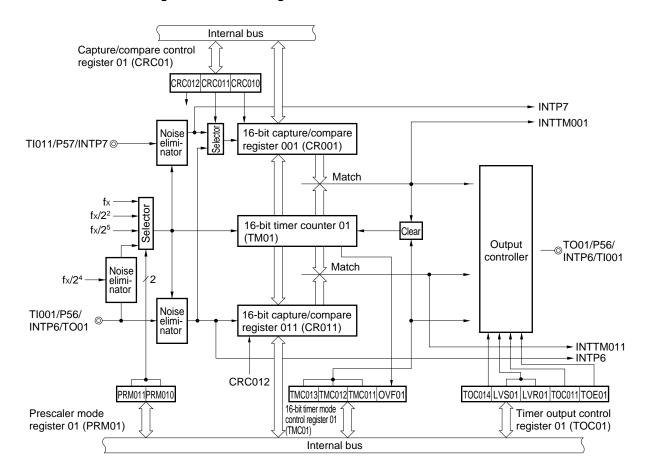

Figure 6-2. Block Diagram of 16-Bit Timer/Event Counter 01

# (1) 16-bit timer counter 00, 01 (TM00, TM01)

TM00 and TM01 are 16-bit read-only registers that count the count pulses.

The counter is incremented in synchronization with the rising edge of the input clock. If the count value is read during operation, input of the count clock is temporarily stopped, and the count value at that point is read. The count value is reset to 0000H in the following cases.

- <1> At RESET input
- <2> If TMC0n3 and TMC0n2 are cleared
- <3> If the valid edge of TI00n is input in the clear & start mode entered by inputting the valid edge of TI00n
- <4> If TM0n and CR00n match in the clear & start mode entered on a match between TM0n and CR00n

# **Remark** n = 0, 1

#### (2) 16-bit capture/compare register 000, 001 (CR000, CR001)

CR000 and CR001 are 16-bit registers that have the functions of both a capture register and a compare register. Whether to be used as a capture register or as a compare register is set by bit 0 (CRC0n0) of capture/compare control register 0n (CRC0n).

#### When CR00n is used as a compare register

The value set in CR00n is constantly compared with the 16-bit timer counter 0n (TM0n) count value, and an interrupt request (INTTM00n) is generated if they match. It can also be used as the register that holds the interval time when TM0n is set to interval timer operation.

# · When CR00n is used as a capture register

It is possible to select the valid edge of the TI00n pin or the TI01n pin as the capture trigger. Setting of the TI00n or TI01n valid edge is performed by means of prescaler mode register 0n (PRM0n).

If CR00n is specified as a capture register and the capture trigger is specified to be the valid edge of the Tl00n pin, the situation is as shown in Table 6-2. On the other hand, when the capture trigger is specified to be the valid edge of the Tl01n pin, the situation is as shown in Table 6-3.

Table 6-2. TI00n Pin Valid Edge and CR00n, CR01n Capture Triggers

| ES0n1 | ES0n0 | TI00n Pin Valid Edge          | CR00n Capture Trigger | CR01 Capture Trigger          |
|-------|-------|-------------------------------|-----------------------|-------------------------------|
| 0     | 0     | Falling edge                  | Rising edge           | Falling edge                  |
| 0     | 1     | Rising edge                   | Falling edge          | Rising edge                   |
| 1     | 0     | Setting prohibited            | Setting prohibited    | Setting prohibited            |
| 1     | 1     | Both rising and falling edges | No capture operation  | Both rising and falling edges |

n = 0, 1

Table 6-3. TI01n Pin Valid Edge and CR00n Capture Trigger

| ES1n1 | ES1n0 | Tl01n Pin Valid Edge          | CR00n Capture Trigger         |
|-------|-------|-------------------------------|-------------------------------|
| 0     | 0     | Falling edge                  | Falling edge                  |
| 0     | 1     | Rising edge                   | Rising edge                   |
| 1     | 0     | Setting prohibited            | Setting prohibited            |
| 1     | 1     | Both rising and falling edges | Both rising and falling edges |

n = 0, 1

CR00n is set by a 16-bit memory manipulation instruction.

RESET input makes the value of CR00n undefined.

- Cautions 1. In the clear & start mode entered on a match between TM0n and CR00n, set CR00n to a value other than 0000H. However, in the free-running mode and the clear mode of the valid edge of Tl00n, if CR00n is set to 0000H, an interrupt request (INTTM00n) is generated after the overflow (FFFFH).
  - 2. If the value of CR00n after changing is smaller than the value of 16-bit timer counter 0n (TM0n), TM0n continues counting and overflows, then starts counting again from 0. Also, if the value of CR00n after changing is less than the value before changing, it is necessary to restart the timer after CR00n changes.
  - 3. When P54 (P56) is used as the valid edge of TI000 (TI001), it cannot be used as the timer output (TO00 (TO01)). Also, if it is used as TO00 (TO01), it cannot be used as the valid edge of TI000 (TI001).

#### (3) 16-bit capture/compare register 010, 011 (CR010, CR011)

CR010 and CR011 are 16-bit registers that have the functions of both a capture register and a compare register. Whether to be used as a capture register or a compare register is set by bit 2 (CRC0n2) of capture/compare control register 0n (CRC0n).

#### When CR01n is used as a compare register

The value set in CR01n is constantly compared with the 16-bit timer counter 0n (TM0n) count value, and an interrupt request (INTTM01n) is generated if they match.

#### When CR01n is used as a capture register

It is possible to select the valid edge of the Tl00n pin as the capture trigger. The Tl00n valid edge is set by means of prescaler mode register 0n (PRM0n).

CR01n is set by a 16-bit memory manipulation instruction.

RESET input makes the value of CR01n undefined.

Caution In the clear & start mode entered on a match between TM0n and CR00n, set CR01n to a value other than 0000H. However, in the free-running mode and the clear mode of the valid edge of Tl00n, if CR01n is set to 0000H, an interrupt request (INTTM01n) is generated after the overflow (FFFFH).

Remark n = 0, 1

# 6.4 Registers Controlling 16-Bit Timer/Event Counter

The following nine types of registers are used to control 16-bit timer/event counters 00 and 01.

- 16-bit timer mode control register 00, 01 (TMC00, TMC01)
- Capture/compare control register 00, 01 (CRC00, CRC01)
- Timer output control register 00, 01 (TOC00, TOC01)
- Prescaler mode register 00, 01 (PRM00, PRM01)
- Port mode register 5 (PM5)

# (1) 16-bit timer mode control register 00, 01 (TMC00, TMC01)

These registers set the 16-bit timer operating mode, 16-bit timer counter 00, 01 (TM00, TM01) clear mode, and output timing, and detect an overflow.

TMC00 and TMC01 are set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets TMC00 and TMC01 to 00H.

Caution 16-bit timer counter 0n (TM0n) starts operating the instant that TMC0n2 and TMC0n3 (n = 0, 1) are set to a value other than 0 (operation stop mode). To stop operation, set TMC0n2 and TMC0n3 to 0.

Figure 6-3. Format of 16-Bit Timer Mode Control Register 00

| Symbol | 7 | 6 | 5 | 4 | 3      | 2      | 1      | 0     | Address | After reset | R/W |
|--------|---|---|---|---|--------|--------|--------|-------|---------|-------------|-----|
| TMC00  | 0 | 0 | 0 | 0 | TMC003 | TMC002 | TMC001 | OVF00 | FF60H   | 00H         | R/W |

|--------|--------|--------|--|--|--|
| 0      | 0      | 0      | Operation stop                                   | No change  | Not generated  |
| 0      | 0      | 1      | (TM00 cleared to 0)                              |  |  |
| 0      | 1      | 0      | Free-running mode                                | Match between TM00 and CR000 or match between TM00 and CR010                   | Generated on match between TM00 and CR000, or match between TM00 and CR010 |
| 0      | 1      | 1      |  | Match between TM00 and CR000, match between TM00 and CR010 or Tl000 valid edge |  |
| 1      | 0      | 0      | Clear & start on TI000 valid                     | _  |  |
| 1      | 0      | 1      | edge   |  |  |
| 1      | 1      | 0      | Clear & start on match<br>between TM00 and CR000 | Match between TM00 and CR000 or match between TM00 and CR010                   |  |
| 1      | 1      | 1      |  | Match between TM00 and CR000, match between TM00 and CR010 or Tl000 valid edge |  |

| OVF00 | 16-bit timer counter 00 (TM00) overflow detection |
|-------|---|
| 0     | Overflow not detected                             |
| 1     | Overflow detected                                 |

- Cautions 1. Write to a bit other than the OVF00 flag after timer operation stops.
  - 2. Set the valid edge of the TI000/TO00/INTP4/P54 pin with prescaler mode register 00 (PRM00).
  - 3. If clear & start mode entered on a match between TM00 and CR000 is selected, when the set value of CR000 is FFFFH and the TM00 value changes from FFFFH to 0000H, the OVF00 flag is set to 1.

| 1      | 1      | 0      | Clear & start on match<br>between TM01 and CR001 | Match between TM01 and CR001 or match between TM01 and CR011                   |  |
| 1      | 1      | 1      |  | Match between TM01 and CR001, match between TM01 and CR011 or Tl001 valid edge |  |

| OVF01 | 16-bit timer counter 01 (TM01) overflow detection |
|-------|---|
| 0     | Overflow not detected                             |
| 1     | Overflow detected                                 |

- Cautions 1. Write to a bit other than the OVF01 flag after timer operation stops.
  - 2. Set the valid edge of the Ti001/TO01/INTP6/P56 pin with prescaler mode register 01 (PRM01).
  - 3. If clear & start mode entered on a match between TM01 and CR001 is selected, when the set value of CR001 is FFFFH and the TM01 value changes from FFFFH to 0000H, the OVF01 flag is set to 1.

Remarks TO01: 16-bit timer/event counter 01 output pin

TI001: 16-bit timer/event counter 01 input pin

TM01: 16-bit timer counter 01

CR001: 16-bit capture/compare register 001 CR011: 16-bit capture/compare register 011

# (2) Capture/compare control register 00, 01 (CRC00, CRC01)

These registers control the operation of the 16-bit capture/compare registers (CR000, CR010, CR001, CR011). CRC00 and CRC01 are set by a 1-bit or 8-bit memory manipulation instruction. RESET input sets CRC00 and CRC01 to 00H.

Figure 6-5. Format of Capture/Compare Control Register 00

| Symbol | 7 | 6 | 5 | 4 | 3 | 2      | 1      | 0      | Address | After reset | R/W |
|--------|---|---|---|---|---|--------|--------|--------|---------|-------------|-----|
| CRC00  | 0 | 0 | 0 | 0 | 0 | CRC002 | CRC001 | CRC000 | FF62H   | 00H         | R/W |

| CRC002 | CR010 operating mode selection |
|--------|--------------------------------|
| 0      | Operates as compare register   |
| 1      | Operates as capture register   |

|   | CRC001 | CR000 capture trigger selection                   |
|---|--------|---|
| ĺ | 0      | Captures on valid edge of TI010                   |
| ĺ | 1      | Captures on inverted phase of valid edge of TI000 |

| CRC000 | CR000 operating mode selection |
|--------|--------------------------------|
| 0      | Operates as compare register   |
| 1      | Operates as capture register   |

# Cautions 1. Timer operation must be stopped before setting CRC00.

- 2. When clear & start mode entered on a match between TM00 and CR000 is selected with 16bit timer mode control register 00 (TMC00), CR000 should not be specified as a capture register.
- 3. If both the rising and falling edges are selected as the valid edges of Tl000, capture is not performed.
- 4. In order to ensure the capture operation, a pulse longer than two clocks of the count clock specified by prescaler mode register 00 (PRM00) is required for a capture trigger.

Figure 6-6. Format of Capture/Compare Control Register 01

| Symbol | 7 | 6 | 5 | 4 | 3 | 2      | 1      | 0      | Address | After reset | R/W |

| 0      | Captures on valid edge of TI011                   |
| 1      | Captures on inverted phase of valid edge of TI001 |

| CRC010 | CR001 operating mode selection |  |  |  |  |  |
|--------|--------------------------------|--|--|--|--|--|
| 0      | Operates as compare register   |  |  |  |  |  |
| 1      | Operates as capture register   |  |  |  |  |  |

# Cautions 1. Timer operation must be stopped before setting CRC01.

- 2. When clear & start mode on a match between TM01 and CR001 is selected with 16-bit timer mode control register 01 (TMC01), CR001 should not be specified as a capture register.
- 3. If both the rising and falling edges are selected as the valid edges of Ti001, capture is not performed.
- 4. In order to ensure the capture operation, a pulse longer than two clocks of the count clock specified by prescaler mode register 01 (PRM01) is required for a capture trigger.

# (3) Timer output control register 00, 01 (TOC00, TOC01)

These registers control the operation of the 16-bit timer/event counter 00, 01 output control circuit, including R-S type flip-flop (LV0) setting/resetting, output inversion enabling/disabling, and 16-bit timer/event counter 00, 01 timer output enabling/disabling.

TOC00 and TOC01 are set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets TOC00 and TOC01 to 00H.

| TOC011 | Timer output F/F control by match of CR001 and TM01 |
|--------|---|
| 0      | Inversion operation disabled                        |
| 1      | Inversion operation enabled                         |

| TOE01 | 16-bit timer/event counter 01 timer output control |
|-------|--|
| 0     | Output disabled (Output set to level 0)            |
| 1     | Output enabled                                     |

Cautions 1. Timer operation must be stopped before setting TOC01.

2. Be sure to set bits 5 to 7 of TOC01 to 0.

Remark If LVS01 and LVR01 are read after data is set, they will be 0.

# (4) Prescaler mode register 00, 01 (PRM00, PRM01)

This register is used to set the 16-bit timer counter 00, 01 (TM00, TM01) count clock and Tl000, Tl001 input valid edges.

PRM00 and PRM01 are set by an 8-bit memory manipulation instruction.

RESET input sets PRM00 and PRM01 to 00H.

Figure 6-9. Format of Prescaler Mode Register 00

| Symbol | 7     | 6     | 5     | 4     | 3 | 2 | 1      | 0      | Address | After reset | R/W |

# 6.5 Operation of 16-Bit Timer/Event Counter

# 6.5.1 Interval timer operation

Setting 16-bit timer mode control register 0n (TMC0n) and capture/compare control register 0n (CRC0n) as shown in Figure 6-12 allows operation as an interval timer. Interrupt requests are generated repeatedly using the count value preset in 16-bit capture/compare register 00n (CR00n) as the interval.

When the count value of 16-bit timer counter 0n (TM0n) matches the value set to CR00n, counting continues with the TM0n value cleared to 0 and the interrupt request signal (INTTM00n) is generated.

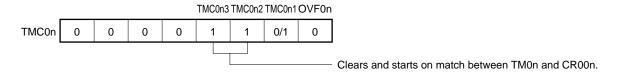

The count clock of TM0n can be selected with bits 0 and 1 (PRM0n0, PRM0n1) of prescaler mode register 0n (PRM0n).

See 6.6 Notes on 16-Bit Timer/Event Counter (3) Operation after compare register change during timer count operation about the operation when the compare register value is changed during timer count operation.

Remark n = 0, 1

Figure 6-12. Control Register Settings for Interval Timer Operation

# (a) 16-bit timer mode control register 0n (TMC0n)

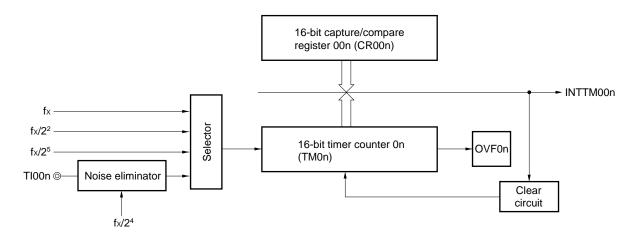

# (b) Capture/compare control register 0n (CRC0n)

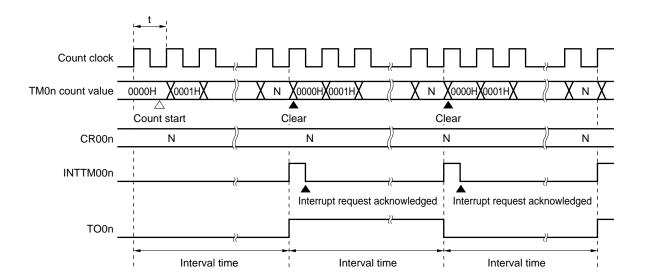

**Remarks 1.** 0/1: Setting 0 or 1 allows another function to be used simultaneously with the interval timer. See Figures 6-3 to 6-6.

Figure 6-13. Interval Timer Configuration Diagram

Remark n = 0, 1

Figure 6-14. Timing of Interval Timer Operation

**Remarks 1.** Interval time =  $(N + 1) \times t$ : N = 0001H to FFFFH

#### 6.5.2 PPG output operation

Setting 16-bit timer mode control register 0n (TMC0n) and capture/compare control register 0n (CRC0n) as shown in Figure 6-15 allows operation as PPG (Programmable Pulse Generator) output.

In the PPG output operation, square waves are output from the TO0n pin with the pulse width and the cycle that correspond to the count values preset in 16-bit capture/compare register 01n (CR01n) and in 16-bit capture/compare register 00n (CR00n).

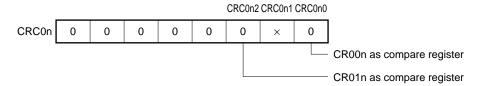

#### Remark n = 0, 1

Figure 6-15. Control Register Settings for PPG Output Operation

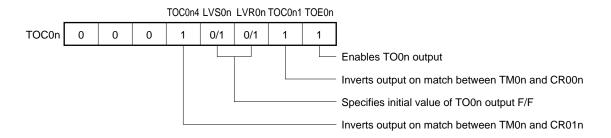

# (a) 16-bit timer mode control register 0n (TMC0n)

# (b) Capture/compare control register 0n (CRC0n)

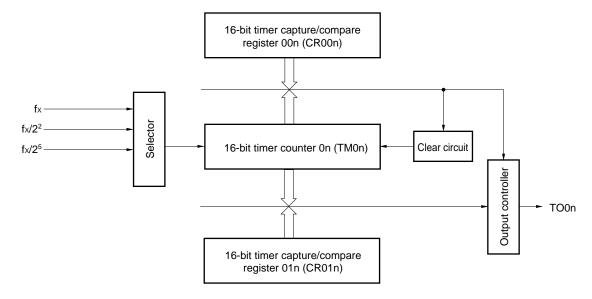

# (c) Timer output control register 0n (TOC0n)

- Cautions 1. Values in the following range should be set in CR00n and CR01n:  $0000H < CR01n < CR00n \le FFFFH$ 
  - 2. The cycle of the pulse generated by PPG output becomes (CR00n setting + 1), and the duty becomes (CR01n setting + 1)/(CR00n setting + 1).

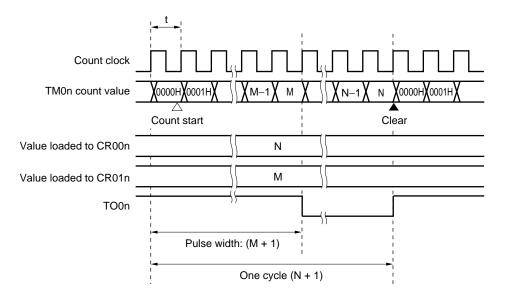

```
Remark \times: don't care n = 0, 1
```

Remark n = 0, 1

Figure 6-17. PPG Output Operation Timing

Remarks 1.  $0000H < M < N \le FFFFH$ 

#### 6.5.3 Pulse width measurement operation

It is possible to measure the pulse width of the signals input to the TI00n and TI01n pins using 16-bit timer counter 0n (TM0n).

There are two measurement methods: measuring with TM0n used in free-running mode, and measuring by restarting the timer in synchronization with the edge of the signal input to the Tl00n pin.

# (1) Pulse width measurement with free-running counter and one capture register

When 16-bit timer counter 0n (TM0n) is operated in free-running mode (see register settings in **Figure 6-18**), and the edge specified by prescaler mode register 0n (PRM0n) is input to the Tl00n pin, the value of TM0n is taken into 16-bit capture/compare register 01n (CR01n) and an external interrupt request signal (INTTM01n) is set.

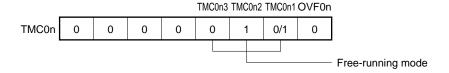

The valid edge of the Tl00n pin is specified by bits 4 and 5 (ES0n0, ES0n1) of PRM0n, and the rising edge, falling edge or both edges can be selected.

When sampling is performed at the count clock cycle selected by PRM0n and the valid level of the Tl00n pin is detected twice, the first capture operation is performed, resulting in the elimination of short pulse width noise.

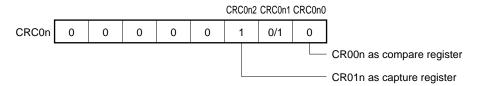

#### Remark n = 0, 1

Figure 6-18. Control Register Settings for Pulse Width Measurement with Free-Running Counter and One Capture Register

# (a) 16-bit timer mode control register 0n (TMC0n)

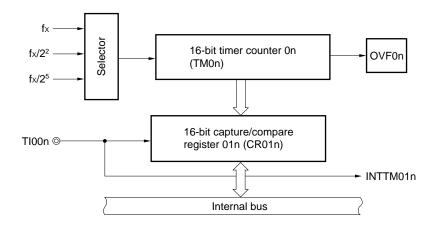

# (b) Capture/compare control register 0n (CRC0n)

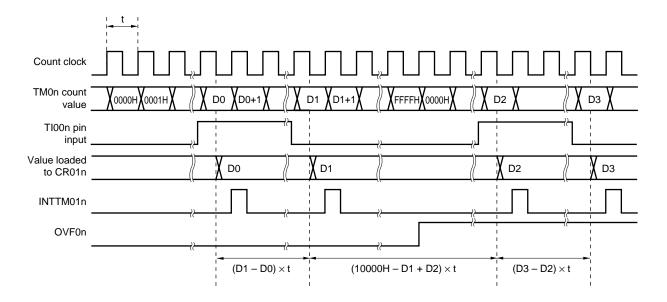

**Remarks 1.** 0/1: Setting 0 or 1 allows another function to be used simultaneously with pulse width measurement. See **Figures 6-3** to **6-6** for details.

Figure 6-19. Configuration Diagram for Pulse Width Measurement with Free-Running Counter

Remark n = 0, 1

Figure 6-20. Timing of Pulse Width Measurement Operation with Free-Running Counter and One Capture Register (with Both Edges Specified)

#### (2) Measurement of two pulse widths with free-running counter

When 16-bit timer counter 0n (TM0n) is operated in free-running mode (see register settings in **Figure 6-21**), it is possible to simultaneously measure the pulse widths of the two signals input to the Tl00n and the Tl01n pins. When the edge specified by bits 4 and 5 (ES0n0, ES0n1) of prescaler mode register 0n (PRM0n) is input to the Tl00n pin, the value of TM0n is taken into 16-bit capture/compare register 01n (CR01n) and an external interrupt request signal (INTTM01n) is set.

Also, when the edge specified by bits 6 and 7 (ES1n0, ES1n1) of PRM0n is input to the Tl01n pin, the value of TM0n is taken into 16-bit capture/compare register 00n (CR00n) and an external interrupt request signal (INTTM00n) is set.

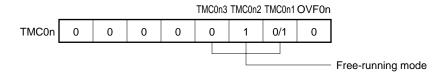

The valid edges of the Tl00n and Tl01n pins are specified by bits 4 and 5 (ES0n0, ES0n1), and bits 6 and 7 (ES1n0, ES1n1) of PRM0n, respectively. It is possible to select the rising edge, falling edge or both edges as the valid edge.

When sampling is performed at the count clock cycle selected by PRM0n and the valid level of the Tl00n or Tl01 pin is detected twice, the first capture operation is performed, resulting in the elimination of short pulse width noise.

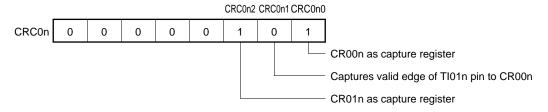

Remark n = 0, 1

Figure 6-21. Control Register Settings for Measurement of Two Pulse Widths with Free-Running Counter

#### (a) 16-bit timer mode control register 0n (TMC0n)

# (b) Capture/compare control register 0n (CRC0n)

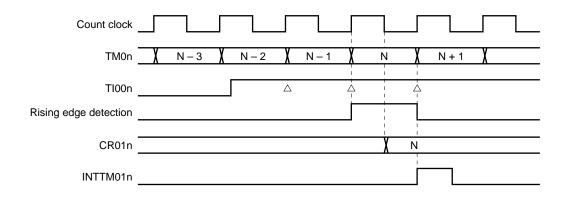

**Remarks 1.** 0/1: Setting 0 or 1 allows another function to be used simultaneously with pulse width measurement. See **Figures 6-3** and **6-4** for details.

# • Capture operation (Free-running mode)

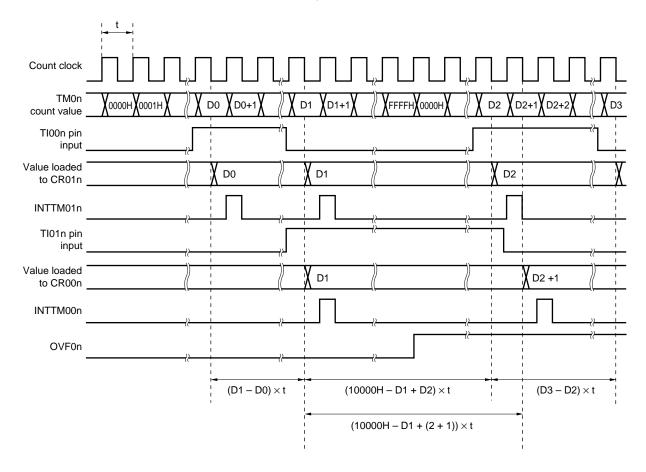

The capture register operation of when the capture trigger is input is shown.

Figure 6-22. CR01n Capture Operation with Rising Edge Specified

Remark n = 0, 1

Figure 6-23. Timing of Pulse Width Measurement Operation with Free-Running Counter (with Both Edges Specified)

#### (3) Pulse width measurement with free-running counter and two capture registers

When 16-bit timer counter 0n (TM0n) is operated in free-running mode (see register settings in **Figure 6-24**), it is possible to measure the pulse width of the signal input to the Tl00n pin.

When the edge specified by bits 4 and 5 (ES0n0, ES0n1) of prescaler mode register 0n (PRM0n) is input to the TI00n pin, the value of TM0n is taken into 16-bit capture/compare register 01n (CR01n) and an external interrupt request signal (INTTM01n) is set.

Also, when the inverse edge to that of the capture operation to CR01n is input, the value of TM0n is taken into 16-bit capture/compare register 00n (CR00n).

The valid edge of the Tl00n pin is specified by bits 4 and 5 (ES0n0, ES0n1) of PRM0n, and it is possible to select the rising edge or falling edge.

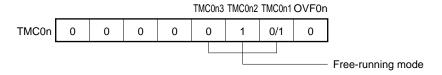

When sampling is performed at the count clock cycle selected by PRM0n and the valid level of the Tl00n pin is detected twice, the first capture operation is performed, resulting in the elimination of short pulse width noise.

Caution If the valid edge of the Tl00n pin is specified to be both the rising and falling edges, capture/compare register 00n (CR00n) cannot perform the capture operation.

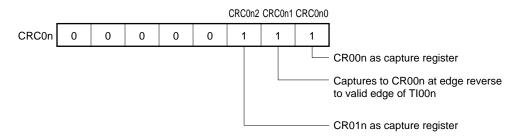

Remark n = 0, 1

Figure 6-24. Control Register Settings for Pulse Width Measurement with Free-Running Counter and Two Capture Registers

# (a) 16-bit timer mode control register 0n (TMC0n)

# (b) Capture/compare control register 0n (CRC0n)

Remarks 1. 0/1: Setting 0 or 1 allows another function to be used simultaneously with pulse width measurement. See Figures 6-3 and 6-4 for details.

Count clock TM0n count value TI00n pin input Value loaded D0 D2 to CR01n Value loaded D1 D3 to CR00n INTTM01n OVF0n  $(10000H - D1 + D2) \times t$  $(D1 - D0) \times t$  $(D3 - D2) \times t$ 

Figure 6-25. Timing of Pulse Width Measurement Operation by Free-Running Counter and Two Capture Registers (with Rising Edge Specified)

Remark n = 0, 1

# (4) Pulse width measurement by means of restart

When input of a valid edge to the TI00n pin is detected, the count value of 16-bit timer counter 0n (TM0n) is taken into 16-bit capture/compare register 01n (CR01n), and then the pulse width of the signal input to the TI00n pin is measured by clearing TM0n and restarting the count (see register settings in **Figure 6-26**).

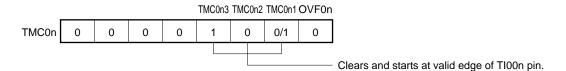

The valid edge of the TI00n pin is specified by bits 4 and 5 (ES0n0, ES0n1) of prescaler mode register 0n (PRM0n), and it is possible to select either the rising edge or falling edge.

When sampling is performed at the count clock cycle selected by PRM0n and the valid level of the Tl00n pin is detected twice, the first capture operation is performed, resulting in the elimination of short pulse width noise.

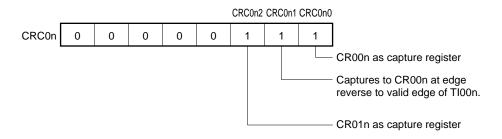

Caution If the valid edge of the Tl00n pin is specified to be both the rising and falling edges, capture/compare register 00n (CR00n) cannot perform the capture operation.

Figure 6-26. Control Register Settings for Pulse Width Measurement by Means of Restart

# (a) 16-bit timer mode control register 0n (TMC0n)

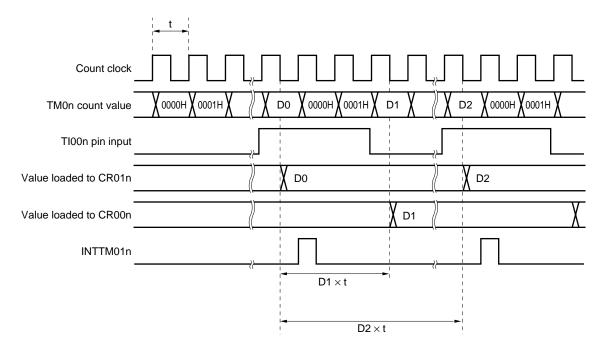

# (b) Capture/compare control register 0n (CRC0n)

**Remarks 1.** 0/1: Setting 0 or 1 allows another function to be used simultaneously with pulse width measurement. See **Figures 6-3** and **6-4** for details.

**2.** n = 0, 1

Figure 6-27. Timing of Pulse Width Measurement Operation by Means of Restart (with Rising Edge Specified)

#### 6.5.4 External event counter operation

The external event counter counts the number of external clock pulses to be input to the Tl00n pin by 16-bit timer counter 0n (TM0n).

TM0n is incremented each time the valid edge specified by prescaler mode register 0n (PRM0n) is input.

When the TM0n count value matches the 16-bit capture/compare register 00n (CR00n) value, TM0n is cleared to 0 and an interrupt request signal (INTTM00n) is generated.

A value other than 0000H should be set for CR00n (a 1-pulse count operation is not possible).

Specify the valid edge of the Tl00n pin using bits 4 and 5 (ES0n0, ES0n1) of PRM0n. It is possible to select the rising edge, falling edge or both edges.

When sampling is performed at the internal clock ( $fx/2^4$ ) and the valid level of the TI00n pin is detected twice, the first capture operation is performed, resulting in the elimination of short pulse width noise.

Caution When the 16-bit timer/event counter is being used as an external event counter, the P54/TI000/TO00/INTP4 pin (P56/TI001/TO01/INTP6 pin) cannot be used for timer output (T000 (T001)).

Remark n = 0, 1

Caution When reading the external event counter count value, TM0n (n = 0, 1) should be read.

Remark n = 0, 1

# 6.5.5 Square-wave output operation

This is an operation whereby a square wave with any selected frequency is output using the count value preset to 16-bit capture/compare register 00n (CR00n) as the interval.

The TO0n pin output status is inverted at the intervals of the count value preset to CR00n by setting bit 0 (TOE0n) and bit 1 (TOC0n1) of timer output control register 0n (TOC0n) to 1. This enables a square wave with any selected frequency to be output.

Figure 6-31. Control Register Settings in Square-Wave Output Mode

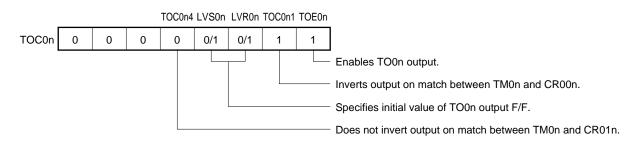

# (a) 16-bit timer mode control register 0n (TMC0n)

# (b) Capture/compare control register 0n (CRC0n)

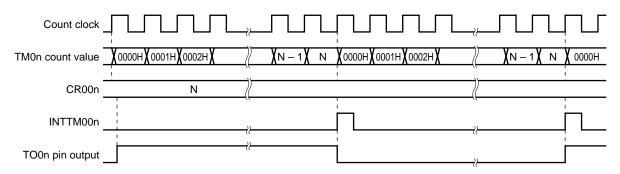

# (c) Timer output control register 0n (TOC0n)

Remarks 1. 0/1: Setting 0 or 1 allows another function to be used simultaneously with square-wave output. See Figures 6-3 to 6-8 for details.

**2.** n = 0, 1

Figure 6-32. Square-Wave Output Operation Timing

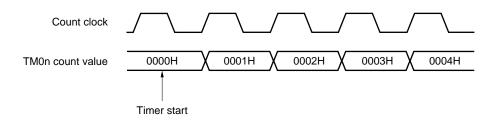

#### 6.6 Notes on 16-Bit Timer/Event Counter

#### (1) Timer start errors

An error of a maximum of one clock may occur during the time required for a match signal to be generated after timer start. This is because 16-bit timer counter 0n (TM0n: n = 0, 1) is started asynchronously to the count clock.

Figure 6-33. 16-Bit Timer Counter Start Timing

**Remark** n = 0, 1

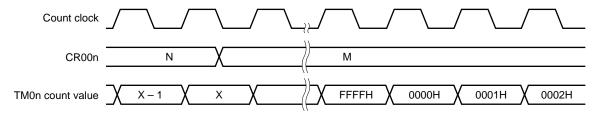

(2) 16-bit compare register setting (clear & start mode entered on a match between TM0n and CR00n)

Set 16-bit capture/compare registers 00n, 01n (CR00n, CR01n: n = 0, 1) to other than 0000H. This means a 1pulse count operation cannot be performed when they are used as event counters.

# (3) Operation after compare register change during timer count operation

If the value after the change of 16-bit capture/compare register 00n (CR00n: n = 0, 1) is smaller than that of 16-bit timer counter 0n (TM0n: n = 0, 1), TM0n continues counting, overflows and then restarts counting from 0. Thus, if the value (M) after the CR00n change is smaller than that (N) before the change, it is necessary to reset the timer to restart after CR00n is changed.

Figure 6-34. Timing After Change of Compare Register During Timer Count Operation

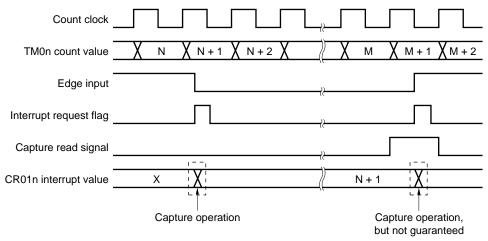

Remark N > X > Mn = 0, 1

# (4) Capture register data retention timing

If the valid edge of the TI00n pin is input during 16-bit capture/compare register 01n (CR01n) read, CR01n performs a capture operation, but the capture value at this time is not guaranteed. However, the interrupt request signal (TMIF01n) is set upon detection of the valid edge.

**Remark** n = 0, 1

Figure 6-35. Capture Register Data Retention Timing

Remark n = 0, 1

# (5) Valid edge setting

Set the valid edge of the Tl00n pin after setting bits 2 and 3 (TMC0n2 and TMC0n3) of 16-bit timer mode control register 0n (TMC0n) to 0, and stopping timer operation. The valid edge is set with bits 4 and 5 (ES0n0 and ES0n1) of prescaler mode register 0n (PRM0n).

#### (6) Operation of OVF0n flag

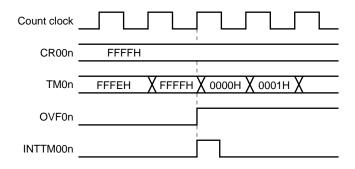

<1> The OVF0n flag (bit 6 of 16-bit timer mode control register 0n (TMC0n)) is set to 1 the next time.

One of clear & start mode entered on match between TM0n and CR00n, clear & start mode entered at the valid edge of Tl00n, and free-running mode is selected.

When TM0n is counted up from FFFFH to 0000H.

#### Remark n = 0, 1

Figure 6-36. Operation Timing of OVF0n Flag

# Remark n = 0, 1

<2> After TM0n overflows, it is reset and the clear instruction becomes invalid even though the OVF0n flag is cleared before the next count clock (before TM0n becomes 0001H).

Remark n = 0, 1

# (7) Conflicting Operations

<1> Conflicting operations between the read time of 16-bit capture/compare register 00n, 01n (CR00n, CR01n) and capture trigger input (CR00n and CR01n used as capture register)

Capture trigger input has priority. The data read from CR00n and CR01n is undefined.

<2> Match timing of conflicting operations between the write period of 16-bit capture/compare register 00n, 01n (CR00n, CR01n) and 16-bit timer counter 0n (TM0n) (CR00n and CR01n used as compare register)

Match judgement is not performed normally. Do not write any data to CR00n and CR01n near the match timing.

#### (8) Timer operation

- <1> Even if 16-bit timer counter 0n (TM0n) is read, the value is not captured in 16-bit capture/compare register 01n (CR01n).
- <2> Regardless of the operation mode of the CPU, if the timer is stopped, the noise of the external interrupt request input is not removed.

Remark n = 0, 1

# (9) Capture operation

- <1> When the valid edge of Tl00n (n = 0, 1) is specified for the count clock, the capture register that specified Tl00n as the trigger cannot perform the capture operation normally.
- <2> A capture operation is not performed when both the rising and falling edges are specified for the Tl00n valid edge.
- <3> In order to ensure the capture operation, a pulse longer than two clocks of the count clock specified by prescaler mode register 0n (PRM0n) is required for a capture trigger.
- <4> Capture operations start at the falling edge of the count clock. However, interrupt request input (INTTM00n) starts at the rising edge of the count clock.

Remark n = 0, 1

#### (10) Compare operation

- <1> If values are written to 16-bit capture/compare registers 00n and 01n (CR00n, CR01n) at the timing when the set values of CR00n and CR01n and the count value of 16-bit timer counter 0n (TM0n) match generating INTTM00n and INTTM01n, INTTM00n and INTTM01n may not be generated. Therefore, do not write values to CR00n and CR01n repeatedly even if the values are the same.
- <2> CR00n and CR01n set in the compare mode cannot perform a capture operation even if the capture trigger is input.

Remark n = 0, 1

# (11) Edge detection

- <1> When the TI00n pin or the TI01n pin is high level immediately after system reset, and if the rising edge or both edges are specified as the valid edge of the TI00n pin or the TI01n pin, then the rising edge is detected immediately after operation of 16-bit timer counter 0n (TM0n) is enabled. Be careful when the TI00n pin or the TI01n pin is pulled up. When operation is enabled again after once being stopped, the rising edge cannot be detected.
- <2> A different sampling clock for noise elimination is used when the Tl00n pin valid edge is used for the count clock and when it is used for capture trigger. In the former case, a count clock of fx/2<sup>4</sup> is used, and in the latter case the count clock specified by prescaler mode register 0n (PRM0n) is used for sampling. A capture operation is only performed when sampling is performed at the above described sampling clock and when a valid level is detected twice, thus eliminating noise with a short-pulse width.

# **CHAPTER 7 8-BIT TIMER/EVENT COUNTER**

# 7.1 Outline of 8-Bit Timer/Event Counter

An 8-bit timer/event counter can be used as an interval timer, external event counter, to output a square wave with any selected frequency, and for PWM output. Two 8-bit timer/event counters can be used as one 16-bit timer/event counter.

# 7.2 Function of 8-Bit Timer/Event Counter

The 8-bit timer/event counters (50, 51, and 52) have the following two modes.

- Mode in which an 8-bit timer/event counter is used alone (single mode)
- Mode in which two or more 8-bit timer/event counters are connected in cascade (16-bit resolution: cascade mode)

These two modes are explained below.

# (1) Mode in which an 8-bit timer/event counter is used alone (single mode)

In this mode, the 8-bit timer/event counter can be used for the following functions.

- Interval timer
- External event counter
- Square-wave output
- PWM output

# (2) Mode in which TM50 and TM51, or TM51 and TM52 are connected in cascade (16-bit resolution: cascade mode)

By connecting 8-bit timer/event counters in cascade, they can be used as a 16-bit timer/event counter. In the cascade mode, the 8-bit timer/event counters can be used for the following functions.

- 16-bit resolution interval timer
- 16-bit resolution external event counter
- 16-bit resolution square-wave output

# 7.3 Configuration of 8-Bit Timer/Event Counter

An 8-bit timer/event counter includes the following hardware.

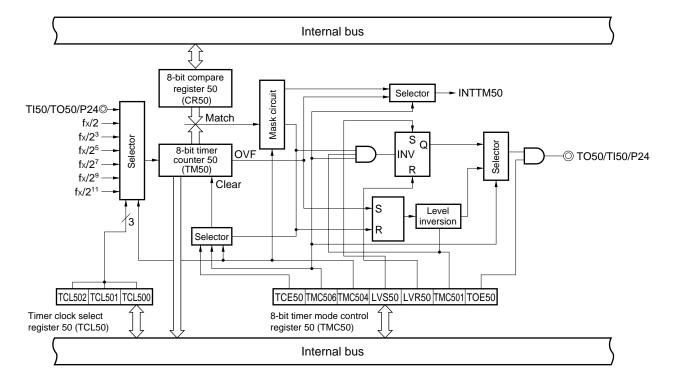

Table 7-1. Configuration of 8-Bit Timer/Event Counter

| Item              | Configuration  |
|-------------------|--|
| Timer register    | 8-bit timer counter 5n (TM5n)  |
| Register          | 8-bit compare register 5n (CR5n)   |
| Timer output      | TO5n   |
| Control registers | 8-bit timer mode control register 5n (TMC5n) Timer clock select register 5n (TCL5n) Port mode register 2 (PM2) <sup>Note</sup> |

Note Refer to Figure 4-4 Block Diagram of P20 to P26.

**Remark** n = 0 to 2

Figure 7-1. Block Diagram of 8-Bit Timer/Event Counter 50

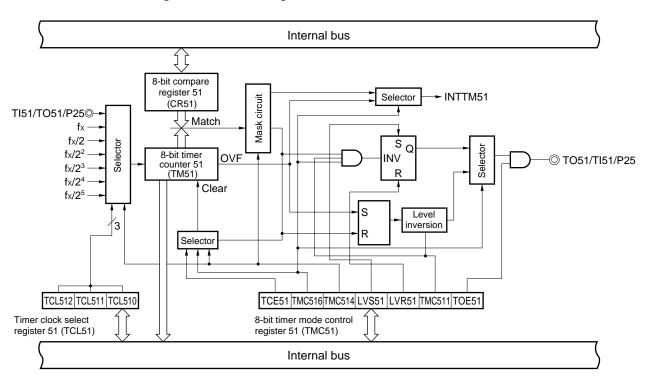

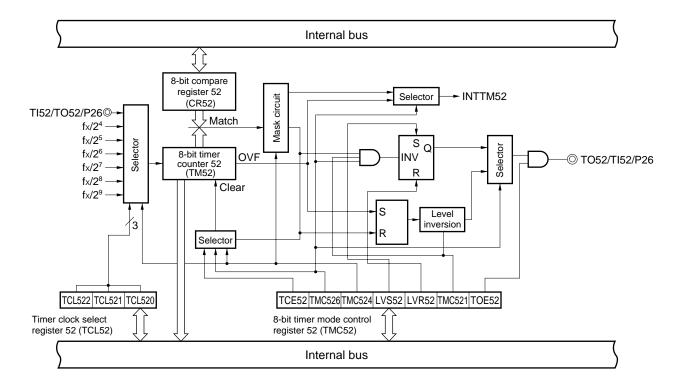

Figure 7-2. Block Diagram of 8-Bit Timer/Event Counter 51

Figure 7-3. Block Diagram of 8-Bit Timer/Event Counter 52

#### (1) 8-bit timer counters 50, 51, and 52 (TM50, TM51, and TM52)

TM50, TM51, and TM52 are 8-bit read-only registers that count count pulses.

These counters are incremented in synchronization with the rising edge of the count clock.

TM50 and TM51, or TM51 and TM52 can be connected in cascade and used as a 16-bit timer.

When TM50 and TM51 are connected in cascade and used as a 16-bit timer, the values of these timer counters can be read using a 16-bit manipulation instruction. TM50 and TM51 are connected with an internal 8-bit bus, and are read one at a time. This means that the value of TM50, for example, may change while that of TM51 is read. Therefore, read TM50 and TM51 two times to compare their first and second values for the sake of accuracy.

When TM51 and TM52 are connected in cascade and used as a 16-bit timer, they cannot be read using a 16-bit manipulation instruction. When reading TM51 and TM52, read them separately using an 8-bit manipulation instruction.

If the count value is read during operation, input of the count clock is temporarily stopped, and the count value at that point is read. The count value is cleared to 00H in the following cases.

- <1> RESET input
- <2> Clearing TCE5n
- <3> Match between TM5n and CR5n in clear & start mode

Caution In a cascade connection, the 16-bit timer is cleared to 00H regardless of whether TCE51 of TM51 or TCE52 of TM52 is cleared.

**Remark** n = 0 to 2

# (2) 8-bit compare registers 50, 51, and 52 (CR50, CR51, and CR52)

The value set to CR5n is always compared with the count value of 8-bit timer counter 5n (TM5n). When the value of the compare register matches the value of the timer counter, an interrupt request (INTTM5n) is generated (in a mode other than the PWM mode).

The value of CR5n can be set in the range of 00H to FFH and can be rewritten during counting.

If TM50 and TM51 are connected in cascade and used as a 16-bit timer, CR50 and CR51 operate as a 16-bit compare register. Therefore, the count value and register value are compared in 16-bit units, and if the two values match, an interrupt request (INTTM50) is generated. At this time, the INTTM51 interrupt request is also generated. When connecting TM50 and TM51 in cascade, therefore, mask the INTTM51 interrupt request.

The same applies when TM51 and TM52 are connected in cascade. If the value of the 16-bit timer matches that of the 16-bit compare register, the INTTM51 interrupt request is generated (so mask the INTTM52 interrupt request).

CR50, CR51, and CR52 are set by an 8-bit memory manipulation instruction.

When CR50 and CR51 are connected in cascade, these registers function as the CR5 register and can be accessed in 16 bits.

RESET input makes these registers undefined.

Caution When changing the setting value of 8-bit compare register 5n (CR5n) in cascade mode, stop each timer operation of 8-bit timer counter 5n (TM5n) connected in cascade.

**Remark** n = 0 to 2

# 7.4 Registers Controlling 8-Bit Timer/Event Counter

The following seven registers control 8-bit timer/event counters 50, 51, and 52.

- 8-bit timer mode control registers 50, 51, and 52 (TMC50, TMC51, and TMC52)
- Timer clock select registers 50, 51, and 52 (TCL50, TCL51, and TCL52)
- Port mode register 2 (PM2)

# (1) 8-bit timer mode control registers 50, 51, and 52 (TMC50, TMC51, and TMC52)

TMC50, TMC51, and TMC52 perform the following six operations.

- <1> Control of count operation of 8-bit timer counters 50, 51, and 52 (TM50, TM51, and TM52)
- <2> Selection of operation mode of 8-bit timer counters 50, 51, and 52 (TM50, TM51, and TM52)
- <3> Selection of single mode or cascade mode
- <4> Setting of status of timer output F/F (flip-flop)
- <5> Control of timer F/F or selection of active level in PWM (free-running) mode
- <6> Control of timer output

TMC50, TMC51, and TMC52 are set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets these registers to 00H.

Figures 7-4 to 7-6 show the formats of TMC50, TMC51, and TMC52.

| 1     | Enables output.                                      |

Caution Be sure to set (1) the interrupt mask flag (TMMK50) before clearing (0) TCE50 to avoid generating an interrupt when TCE50 is cleared. The procedure to clear (0) TCE50 is as follows.

TMMK50 = 1 ; Mask set TCE50 = 0 ; Timer clear

TMIF50 = 0 ; Interrupt request flag clear

TMMK50 = 0 ; Mask clear

:

TCE50 = 1 ; Timer start

:

**Remarks 1.** The PWM output is at the inactive level in the PWM mode because TCE50 = 0.

2. If LVS50 and LVR50 are read immediately after data has been set, these bits are 0.

Caution Be sure to set (1) the interrupt mask flag (TMMK52) before clearing (0) TCE52 to avoid generating an interrupt when TCE52 is cleared. The procedure to clear (0) TCE52 is as follows.

TMMK52 = 1 ; Mask set TCE52 = 0 ; Timer clear

TMIF52 = 0 ; Interrupt request flag clear

TMMK52 = 0 ; Mask clear

TCE52 = 1 ; Timer start

:

**Remarks 1.** PWM output is at the inactive level in the PWM mode because TCE52 = 0.

2. If LVS52 and LVR52 are read immediately after data has been set, these bits are 0.

## (2) Timer clock select registers 50, 51, and 52 (TCL50, TCL51, and TCL52)

These registers specify the count clock of 8-bit timer counters 50, 51, and 52 (TM50, TM51, and TM52) and the valid edges of the TI50, TI51, and TI52 inputs.

TCL50, TCL51, and TCL52 are set by an 8-bit memory manipulation instruction.

RESET input clears these registers to 00H.

Figures 7-7 to 7-9 show the formats of TCL50, TCL51, and TCL52.

Note Expanded-specification products only.

Cautions 1. Before rewriting the data of TCL52, stop the timer operation once.

2. Be sure to clear bits 3 to 7 of TCL52 to 0.

Remarks 1. fx: System clock oscillation frequency

2. The settings of TCL520 to TCL522 are invalid when TM51 and TM52 are connected in cascade.

## (3) Port mode register 2 (PM2)

This register sets port 2 in the input or output mode in 1-bit units.

When the P24/TI50/TO50 to P26/TI52/TO52 pins are used for timer output, clear PM24 to PM26 and the output latches of P24 to P26 to 0.

PM2 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets this register to FFH.

Figure 7-10. Format of Port Mode Register 2

| Symbol | 7 | 6    | 5    | 4    | 3    | 2    | 1    | 0    | Address | After reset | R/W |

## 7.5 Operation of 8-Bit Timer/Event Counter

#### 7.5.1 Interval timer (8-bit) operation

The 8-bit timer/event counters operate as interval timers that repeatedly generate an interrupt request at time intervals specified by the count values preset to corresponding 8-bit compare register 5n (CR5n).

When the count values of 8-bit timer counter 5n (TM5n) match the values set to corresponding compare register CR5n, the value of TM5n is cleared to 0, TM5n continues counting, and at the same time, an interrupt request signal (INTTM5n) is generated.

The count clock of TM5n can be selected by bits 0 to 2 (TCL5n0 to TCL5n2) of timer clock select register 5n (TCL5n).

For the operation to be performed when the value of the compare register is changed during timer count operation, refer to **7.6 Notes on 8-Bit Timer/Event Counter (2)**.

## <Setting>

<1> Set each register.

• TCL5n: Selects count clock.

• CR5n: Compare value

• TMC5n: Selects clear & start mode entered on match between TM5n and CR5n

 $(TMC5n = 0000 \times \times \times 0B \times = don't care).$ 

<2> The count operation is started when TCE5n is set to 1.

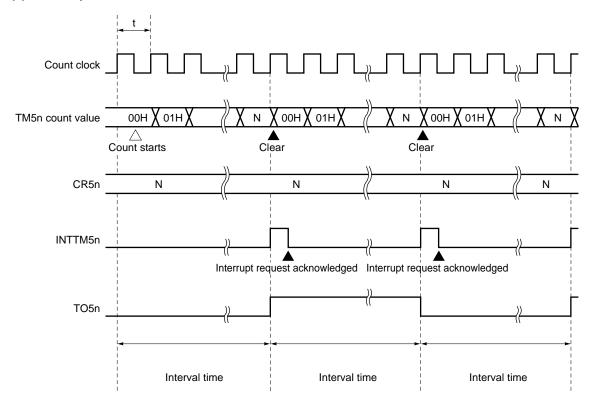

<3> INTTM5n occurs when the values of TM5n and CR5n Match (TM5n is cleared to 00H).

<4> After that, INTTM5n repeatedly occurs at the same interval. To stop the count operation, clear TCE5n to 0.

**Remark** n = 0 to 2

Figure 7-11. Interval Timer Operation Timing (1/3)

## (a) Basic operation

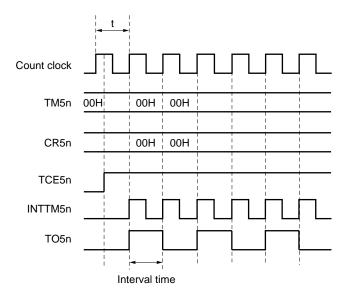

**Remarks 1.** Interval time =  $(N + 1) \times t$ : N = 00H to FFH

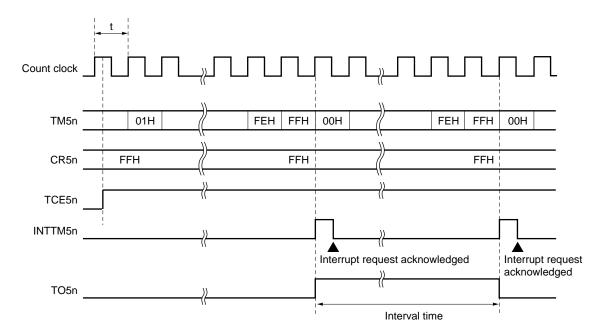

**2.** n = 0 to 2

Figure 7-11. Interval Timer Operation Timing (2/3)

# (b) When CR5n = 00H

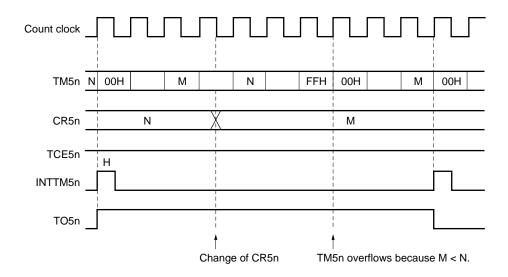

# (c) When CR5n = FFH

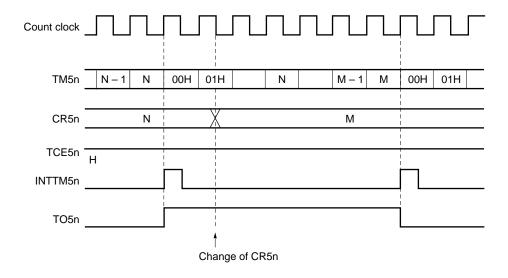

**Remark** n = 0 to 2

Figure 7-11. Interval Timer Operation Timing (3/3)

# (d) Operation when CR5n is changed (M < N)

# (e) Operation when CR5n is changed (M > N)

**Remark** n = 0 to 2

## 7.5.2 External event counter operation

The external event counter counts the number of clock pulses externally input to the TI50/P24 to TI52/P26 pins by using 8-bit timer counter 5n (TM5n).

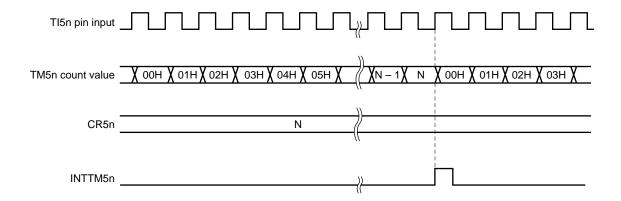

Each time the valid edge specified by timer clock select register 5n (TCL5n) is input, the value of TM5n is incremented. Either the rising edge or falling edge can be specified as the valid edge.

When the count value of TM5n matches the values of corresponding 8-bit compare register 5n (CR5n), TM5n is cleared to 0, and an interrupt request signal (INTTM5n) is generated.

Whenever the TM5n value matches the value of CR5n, INTTM5n is generated.

**Remark** n = 0 to 2

Figure 7-12. External Event Counter Operation Timing (with Rising Edge Specified)

Remark N = 00H to FFH n = 0 to 2

#### 7.5.3 Square-wave output (8-bit resolution) operation

The 8-bit timer/event counters operate as a square wave output at the interval preset to 8-bit compare register 5n (CR5n).

When bit 0 (TOE5n) of 8-bit timer mode control register 5n (TMC5n) is set to 1, the output status of TO5n is inverted at the interval time specified by the count value preset to CR5n. In this way, a square-wave of any frequency (duty factor = 50%) can be output.

#### <Setting>

<1> Set each register.

• Clear the port latch and port mode register 2 (PM2) to 0.

TCL5n: Selects count clockCR5n: Compare value

• TMC5n: Clear & start mode entered on match between TM5n and CR5n

| LVS5n | LVR5n | Timer output F/F status setting |
|-------|-------|---------------------------------|
| 1     | 0     | High-level output               |
| 0     | 1     | Low-level output                |

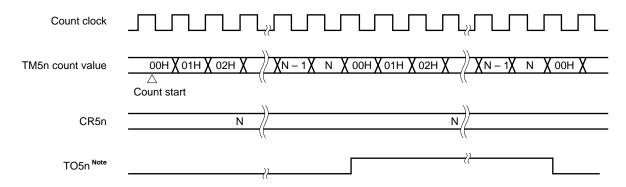

Enables inverting timer output F/F

Timer output enabled → TOE5n = 1

- <2> The count operation is started if TCE5n is set to 1.
- <3> The timer output F/F is inverted if the values of TM5n and CR5n match. INTTM5n occurs and TM5n is cleared to 00H.
- <4> After that, the timer output F/F is inverted at the same interval, and a square-wave is output from TO5n.

**Remark** n = 0 to 2

Figure 7-13. Square-Wave Output Operation Timing

**Note** The initial value of TO5n output can be set with bits 2 and 3 (LVR5n and LVS5n) of 8-bit timer mode control register 5n (TMC5n).

**Remark** n = 0 to 2

#### 7.5.4 8-bit PWM output operation

The PWM output operation is performed when bit 6 (TMC5n6) of 8-bit timer mode control register 5n (TMC5n) is set to 1.

A pulse with a duty factor determined by the value set to 8-bit compare register 5n (CR5n) is output from TO5n. Set the width of the active level of the PWM pulse to CR5n. The active level can be selected using bit 1 (TMC5n1) of TMC5n.

The count clock can be selected by bits 0 to 2 (TCL5n0 to TCL5n2) of timer clock select register 5n (TCL5n). PWM output can be enabled or disabled by bit 0 (TOE5n) of TMC5n.

#### (1) Basic operation of PWM output

#### <Setting>

- <1> Clear the port latch and port mode register 2 (PM2) to 0.
- <2> Set an active level width with 8-bit compare register 5n (CR5n).
- <3> Select a count clock with timer clock select register 5n (TCL5n).
- <4> Set an active level using bit 1 (TMC5n1) of TMC5n.
- <5> The count operation is started when bit 7 (TCE5n) of TMC5n is set to 1. To stop the count operation, clear TCE5n to 0.

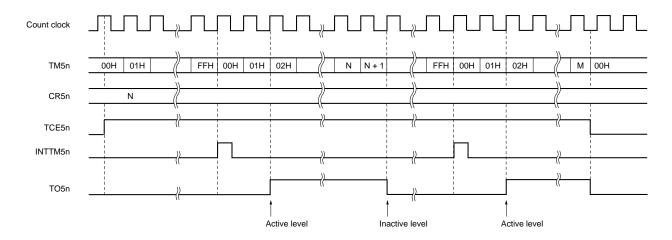

### <PWM output operation>

- <1> When the count operation is started, an inactive level is output as the PWM output (output from TO5n) until an overflow occurs.
- <2> When an overflow occurs, the active level set in step <1> above is output. This active level is continuously output until the value of CR5n matches the count value of 8-bit timer counter 5n (TM5n).
- <3> An inactive level is output as the PWM output after the value of CR5n has matched the count value of TM5n, until an overflow occurs again.
- <4> After that, <2> and <3> are repeated until the count operation is stopped.
- <5> When the count operation is stopped by clearing TCE5n to 0, the PWM output becomes inactive.

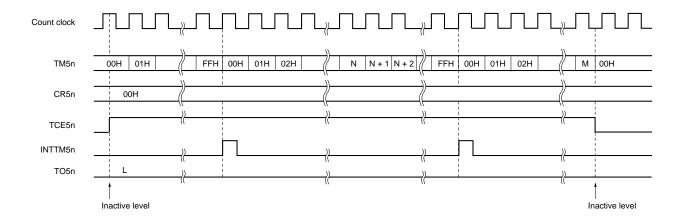

**Remark** n = 0 to 2

Figure 7-14. PWM Output Operation Timing

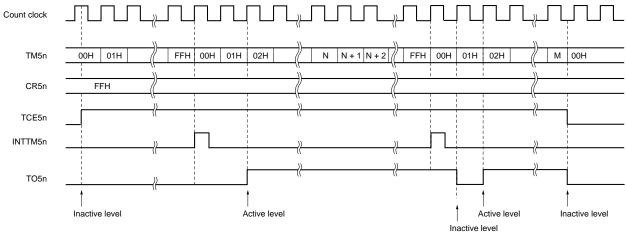

## (a) Basic operation (when active level = H)

## (b) When CR5n = 0

## (c) When CR5n = FFH

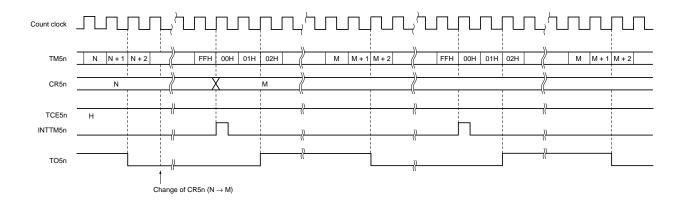

**Remark** n = 0 to 2

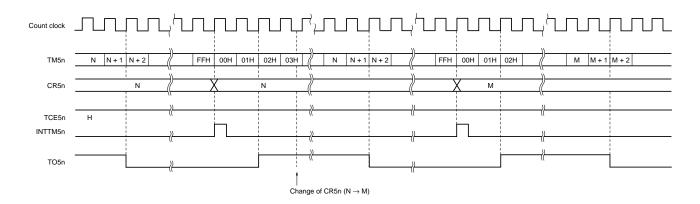

## (2) Operation when CR5n is changed

Figure 7-15. Operation Timing When CR5n Is Changed

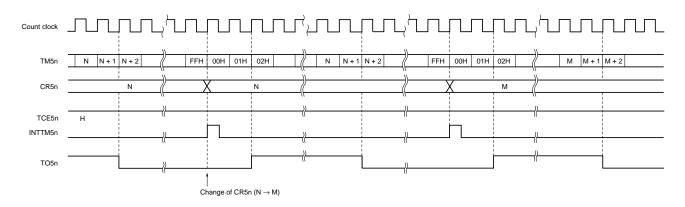

### (a) If value of CR5n is changed from N to M before TM5n overflows

## (b) If value of CR5n is changed from N to M after TM5n overflows

## (c) If value of CR5n is changed from N to M within 2 clocks (00H, 01H) immediately after TM5n overflows

**Remark** n = 0 to 2

#### 7.5.5 Interval timer (16-bit) operation

#### (1) Cascade (16-bit timer) mode (TM50 and TM51)

The 16-bit resolution timer/event counter mode is set by setting bit 4 (TMC514) of 8-bit timer mode control register 51 (TMC51) to 1.

In this mode, TM50 and TM51 operate as a 16-bit interval timer that repeatedly generates an interrupt request at intervals specified by the count value preset to 8-bit compare registers 50 and 51 (CR50 and CR51).

## <Setting>

<1> Set each register.

• TCL50: TM50 selects a count clock.

TM51, which is connected in cascade, does not have to be set.

• CR50 and CR51: Compare values (each compare value can be set in the range of 00H to FFH).

• TMC50 and TMC51: Select the mode that clears and starts the timer on a match between TM50 and CR50 (TM51 and CR51).

TM50  $\rightarrow$  TMC50 = 0000 $\times$  $\times$ 0B  $\times$ : don't care
TM51  $\rightarrow$  TMC51 = 0001 $\times$  $\times$ 0B  $\times$ : don't care

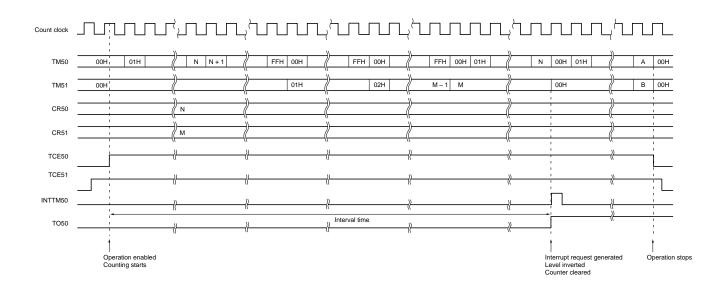

- Sy setting TCE51 to 1 for TMC51 first, and then setting TCE50 to 1 for TMC50, the count operation is started.
- <3> When the value of TM50 connected in cascade matches the value of CR50, TM50 generates INTTM50 (TM50 and TM51 are cleared to 00H).
- <4> After that, INTTM50 is repeatedly generated at the same interval.

## Cautions 1. Be sure to set the compare registers (CR50 and CR51) after stopping the timer operation.

- Even if the timers are connected in cascade, TM51 generates INTTM51 when the count value of TM51 matches the value of CR51. Be sure to mask TM51 to disable it from generating an interrupt.
- 3. Set TCE50 and TCE51 in the order of TM51, then TM50.
- 4. Counting can be started or stopped by setting (1) or clearing (0) only TCE50 of TM50.

Figure 7-16 shows an example of the timing in the 16-bit resolution cascade mode.

Figure 7-16. 16-Bit Resolution Cascade Mode (with TM50 and TM51)

#### (2) Cascade (16-bit timer) mode (TM51 and TM52)

The 16-bit resolution timer/event counter mode is set by setting bit 4 (TMC524) of 8-bit timer mode control register 52 (TMC52) to 1.

In this mode, TM51 and TM52 operate as a 16-bit interval timer that repeatedly generates an interrupt request at intervals specified by the count value preset to 8-bit compare registers 51 and 52 (CR51 and CR52).

#### <Setting>

- <1> Set each register.
  - TCL51: TM51 selects a count clock.

TM52, which is connected in cascade, does not have to be set.

• CR51 and CR52: Compare values (each compare value can be set in the range of 00H to FFH).

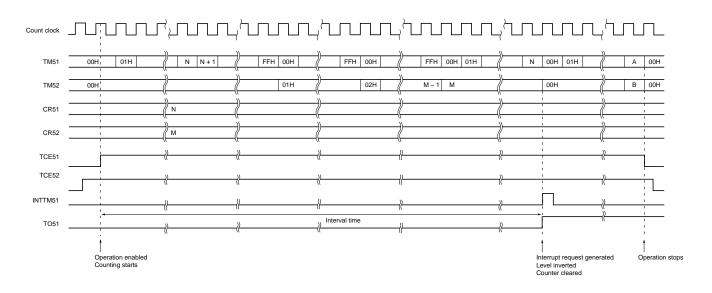

• TMC51 and TMC52: Select the mode that clears and starts the timer on a match between TM51 and CR51 (TM52 and CR52).

TM51  $\rightarrow$  TMC51 = 0000 $\times$  $\times$ 0B  $\times$ : don't care
TM52  $\rightarrow$  TMC52 = 0001 $\times$  $\times$ 0B  $\times$ : don't care

- Sy setting TCE52 to 1 for TMC52 first, and then setting TCE51 to 1 for TMC51, the count operation is started.
- <3> When the value of TM51 connected in cascade matches the value of CR51, TM51 generates INTTM51 (TM51 and TM52 are cleared to 00H).
- <4> After that, INTTM51 is repeatedly generated at the same interval.
- Cautions 1. Be sure to set the compare registers (CR51 and CR52) after stopping the timer operation.
  - Even if the timers are connected in cascade, TM52 generates INTTM52 when the count value of TM52 matches the value of CR52. Be sure to mask TM52 to disable it from generating an interrupt.
  - 3. Set TCE51 and TCE52 in the order of TM52, then TM51.
  - 4. Counting can be started or stopped by setting (1) or clearing (0) only TCE51 of TM51.

Figure 7-17 shows an example of timing in the 16-bit resolution cascade mode.

Figure 7-17. 16-Bit Resolution Cascade Mode (with TM51 and TM52)

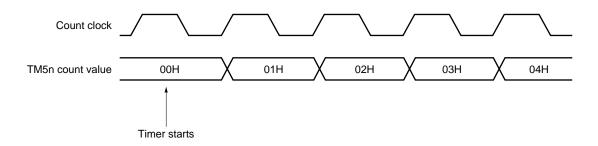

#### 7.6 Notes on 8-Bit Timer/Event Counter

### (1) Error on starting timer

An error of up to 1 clock occurs after the timer has been started until a match signal is generated. This is because 8-bit timer counter 5n (TM5n: n = 0 to 2) is started asynchronously to the count clock.

Figure 7-18. Start Timing of 8-Bit Timer Counter

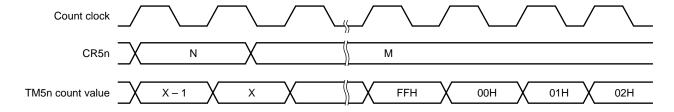

**Remark** n = 0 to 2

## (2) Operation after changing value of compare register during timer count operation

If the new value of 8-bit compare register 5n (CR5n: n=0 to 2) is less than the value of corresponding 8-bit timer counter 5n (TM5n: n=0 to 2), TM5n continues counting, overflows, and restarts counting from 0. Therefore, if the new value of CR5n (M) is less than the old value (N), it is necessary to restart the timer after changing the value of CR5n.

Figure 7-19. Timing After Changing Values of Compare Registers During Timer Count Operation

 $\textbf{Caution} \quad \textbf{Except when TI5n input is selected}, \textbf{be sure to clear TCE5n to 0 before setting the STOP mode}.$ 

Remark N > X > Mn = 0 to 2

## (3) Reading TM5n during timer operation

Because the count clock is stopped when TM5n is read during operation, select a count clock with a waveform whose high-/low-level is longer than two CPU clock cycles. For example, in the case of a CPU clock (fcpu) equal to fx, TM5n can be read as long as the selected count clock is fx/4 or lower.

**Remark** n = 0 to 2

### **CHAPTER 8 10-BIT INVERTER CONTROL TIMER**

### 8.1 Outline of 10-Bit Inverter Control Timer

The 10-bit inverter control timer makes inverter control possible. It consists of an 8-bit dead-time generation timer, and allows non-overlapping active-level output.

### 8.2 Function of 10-Bit Inverter Control Timer

The 10-bit inverter control timer realizes inverter control. It incorporates an 8-bit timer for dead time generation and can output waveforms that do not overlap active levels. A total of six positive phase and negative phase channels are output. In addition, an active level change function and output off function by external input (TOFF7) or watchdog timer interrupt request input are provided.

## 8.3 Configuration of 10-Bit Inverter Control Timer

The 10-bit inverter control timer includes the following hardware.

Table 8-1. Configuration of 10-Bit Inverter Control Timer

| Item              | Function   |  |
|-------------------|--|--|
| Timer counter     | 10-bit up/down counter × 1 (TM7)                         |  |
|                   | Dead-time timers × 3 (DTM0, DTM1, DTM2)                  |  |
|                   | Buffer transfer control timer × 1 (RTM0)                 |  |
| Registers         | 10-bit compare registers × 4 (CM0, CM1, CM2, CM3)        |  |
|                   | 10-bit buffer registers × 4 (BFCM0, BFCM1, BFCM2, BFCM3) |  |
|                   | Dead-time reload register × 1 (DTIME)                    |  |
| Timer outputs     | 6 (TO70, TO71, TO72, TO73, TO74, TO75)                   |  |
| Control registers | Inverter timer control register 7 (TMC7)                 |  |
|                   | Inverter timer mode register 7 (TMM7)                    |  |

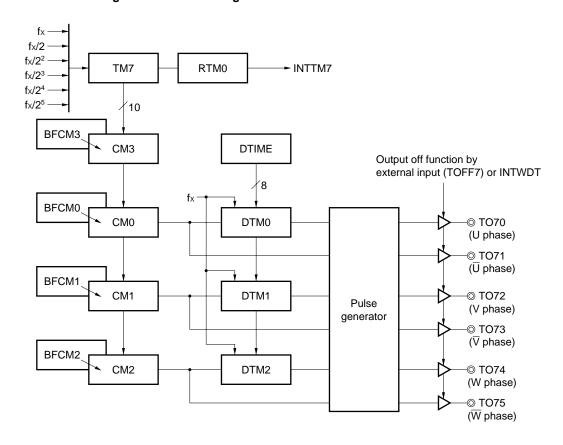

Figure 8-1. Block Diagram of 10-Bit Inverter Control Timer

## (1) 10-bit up/down counter (TM7)

TM7 is a 10-bit up/down counter that counts count pulses in synchronization with the rising edge of the count clock. When the timer starts, the number of count pulse count is incremented from 0, and when the value preset to compare register 3 (CM3) and TM7 count value match, it is switched to the count down operation.

An underflow signal is generated if the value becomes 000H during the count down operation and interrupt request signal INTTM7 is generated. When an underflow occurs, it is switched from the count down operation to the count up operation. INTTM7 is normally generated at every underflow but the number of occurrences can be divided by the IDEV0 to IDEV2 bits of inverter timer control register 7 (TMC7). TM7 cannot be read/written.

The cycle of TM7 is controlled by CM3.

The count clock can be selected from 6 types: fx, fx/2, fx/4, fx/8, fx/16, fx/32.

RESET input or clearing the CE7 bit of TMC7 sets TM7 to 000H.

## (2) 10-bit compare registers 0 to 2 (CM0 to CM2)

CM0 to CM2 are 10-bit compare registers that always compare their own value with that of TM7, and if they match, the contents of the flip-flops are changed.

Each of CM0 to CM2 are provided with a buffer register (BFCM0 to BFCM2), so that the contents of the buffer can be transferred to CM0 to CM2 at the timing of interrupt request signal INTTM7 generation. A write operation to CM0 to CM2 is possible only while TM7 is stopped.

To set the output timing, write data to BFCM0 to BFCM3.

RESET input or clearing the CE7 bit of TMC7 sets these registers to 000H.

#### (3) 10-bit compare register 3 (CM3)

CM3 is a 10-bit compare register that controls the high limit value of TM7. If the count value of TM7 matches the value of CM3 or 0, count up/down is switched at the next count clock.

CM3 provides a buffer register (BFCM3) whose contents are transferred to CM3 at the timing of interrupt request signal INTTM7 generation.

CM3 can be written to only while TM7 is stopped.

To set the cycle to TM7, write data to BFCM3.

RESET input sets CM3 to 0FFH.

Do not set CM3 to 000H.

#### (4) 10-bit buffer registers 0 to 3 (BFCM0 to BFCM3)

BFCM0 to BFCM3 are 10-bit registers. They transfer data to the compare register (CM0 to CM3) corresponding to each buffer register at the timing of interrupt request signal INTTM7 generation.

BFCM0 to BFCM3 can be read/written irrespective of whether TM7 count is stopped or operating.

RESET input sets BFCM0 to BFCM2 to 000H, and BFCM3 to 0FFH.

These registers can be read/written in word and byte units. For read/write operations of less than 8 bits, BFCM0L to BFCM3L are used.

## (5) Dead-time reload register (DTIME)

DTIME is an 8-bit register to set dead time and is common to three dead-time timers (DTM0 to DTM2). However, the data load timing from DTIME to DTM0, DTM1 and DTM2 is independent.

DTIME can be written only while TM7 counting is stopped. Data does not change even if an instruction to rewrite DTIME is executed during timer operation.

RESET input sets DTIME to FFH.

Even if DTIME is set to 00H, an output with the dead time of fx is performed.

#### (6) Dead-time timers 0 to 2 (DTM0 to DTM2)

DTM0 to DTM2 are 8-bit down counters that generate dead time.

Count down is performed after the value of the dead-time reload register (DTIME) is reloaded with the timing of a compare match between CM0 to CM2 and TM7. DTM0 to DTM2 generate an underflow signal when 00H changes to FFH and stop with FFH.

The count clock is fx.

DTM0 to DTM2 cannot be read/written.

RESET input or clearing the CE7 bit of TMC7 sets these registers to FFH.

### (7) Buffer transfer control timer (RTM0)

RTM0 is a 3-bit up counter. It has the function of dividing interrupt request signal INTTM7.

Incrementing is performed with the TM7 underflow signal and INTTM7 is generated when the value matches the number of divisions set with bits IDEV0 to IDEV2 of TMC7.

RTM0 cannot be read/written.

RESET input sets RTM0 to 7H. Generating INTTM7 and clearing the CE7 bit of TMC7 also sets RTM0 to 7H.

# 8.4 Registers Controlling 10-Bit Inverter Control Timer

The following two registers control the 10-bit inverter control timer.

- Inverter timer control register 7 (TMC7)
- Inverter timer mode register 7 (TMM7)

## (1) Inverter timer control register 7 (TMC7)

TMC7 controls the operation of TM7, dead-time timers 0 to 2 (DTM0 to DTM2), and the buffer transfer control timer (RTM0), specifies the count clock of TM7, and selects the compare register transfer cycle. TMC7 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears TMC7 to 00H.

Figure 8-2. Format of Inverter Timer Control Register 7

| Symbol | 7   | 6 | 5     | 4     | 3     | 2     | 1     | 0     | Ad | ddress | After reset | R/W |

| 0     | 1     | 0     | Occurs once every three TM7 underflows. |
| 0     | 1     | 1     | Occurs once every four TM7 underflows.  |
| 1     | 0     | 0     | Occurs once every five TM7 underflows.  |
| 1     | 0     | 1     | Occurs once every six TM7 underflows.   |
| 1     | 1     | 0     | Occurs once every seven TM7 underflows. |
| 1     | 1     | 1     | Occurs once every eight TM7 underflows. |

Note Expanded-specification products only.

## (2) Inverter timer mode register 7 (TMM7)

TMM7 controls the operation of and specifies the active level of the TO70 to TO75 outputs, and sets the valid edge of TOFF7.

TMM7 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears TMM7 to 00H.

Figure 8-3. Format of Inverter Timer Mode Register 7

| Symbol | 7 | 6 | 5 | 4      | 3   | 2     | 1     | 0     | Address | After reset | R/W |
|--------|---|---|---|--------|-----|-------|-------|-------|---------|-------------|-----|
| TMM7   | 0 | 0 | 0 | PNOFFB | ALV | TOEDG | TOSPP | TOSPW | FF91H   | 00H         | R/W |

| PNOFFB | Control status flag of TM7 output to TO70 to TO75  |
|--------|--|
| 0      | TM7 output disabled status (TO70 to TO75 are Hi-Z) |
| 1      | TM7 output enabled status                          |

| ALV | TO70 to TO75 output active level specification |
|-----|--|
| 0   | Low level                                      |
| 1   | High level                                     |

| TOEDG | TOFF7 valid edge specification |
|-------|--------------------------------|
| 0     | Falling edge                   |
| 1     | Rising edge                    |

| TOSPP | TO70 to TO75 output stop control by valid edge of TOFF7 |
|-------|---|
| 0     | Output not stopped.                                     |
| 1     | Output stopped (TO70 to TO75 are Hi-Z).                 |

| TOSPW | TO70 to TO75 output stop control by INTWDT |
|-------|--|
| 0     | Output not stopped.                        |
| 1     | Output stopped (TO70 to TO75 are Hi-Z).    |

**Note** The PNOFFB bit is a read-only flag. This bit cannot be set or reset by software. PNOFFB is reset when an output stop is generated by TOFF7 and INTWDT while TM7 is stopped (CE7 = 0) or operating (CE7 = 1).

Caution Always set bits 5 to 7 of TMM7 to 0.

- **Remarks 1.** TO70 to TO75 become Hi-Z state in the following cases. However, the TM7, DTM0 to DTM2, and RTM0 timers do not stop if CE7 = 1 is set.
  - A valid edge is input to the TOFF7 pin while TOSPP = 1.
  - A specified interrupt request is generated while TOSPW = 1.

To restore the output of TO70 to TO75, perform the procedure below.

- <1> Write 0 to CE7 and stop the timer.
- <2> Write 0 to the output stop function flag that is used.
- <3> Reset the registers to their default values.
- 2. PNOFFB, ALV, CE7, and TO70 to TO75 are related as follows.

| PNOFFB | ALV | CE7 | TO70, TO72, TO74 | TO71, TO73, TO75 |
|--------|-----|-----|------------------|------------------|
| 0      | 0   | 0   | Hi-Z             | Hi-Z             |
| 0      | 1   | 0   | Hi-Z             | Hi-Z             |
| 0      | 0/1 | 1   | Hi-Z             | Hi-Z             |
| 1      | 0/1 | 1   | PWM wave output  | PWM wave output  |

### 8.5 Operation of 10-Bit Inverter Control Timer

#### (1) Setting procedure

- (a) The TM7 count clock is set with the TCL70 to TCL72 bits of inverter timer control register 7 (TMC7) and the occurrence frequency of interrupt request signal INTTM7 is set with the IDEV0 to IDEV2 bits.
- (b) The active level of the TO70 to TO75 pins is set with the ALV bit of inverter timer mode register 7 (TMM7).
- (c) Set the half width of the first PWM cycle to 10-bit compare register 3 (CM3).
  - PWM cycle = CM3 value × 2 × TM7 clock rate
     (The clock rate of TM7 is set with the TMC7)
- (d) Set the half width of the second PWM cycle to 10-bit buffer register 3 (BFCM3).
- (e) Set the dead time width to the dead time reload register (DTIME).
  - Dead time width = (DTIME + 1) x fx
     fx: Internal system clock
- (f) Set the F/F set/reset timing that is used during the first cycle to 10-bit compare registers 0 to 2 (CM0 to CM2).
- (g) Set the F/F set/reset timing that is used during the second cycle to BFCM3.
- (h) After the CE7 bit of TMC7 is set (1), the operation of TM7, dead-time timers 0 to 2 (DTM0 to DTM2), and buffer transfer control timer (RTM0) is enabled.

Caution Always use a bit manipulation instruction to set the CE7 bit.

- (i) Set the F/F set/reset timing that is used for the next cycle to BFCM0 to BFCM3 during TM7 operation.
- (j) To stop the TM7 operation, set the CE7 bit of the TMC7 to 0.

Caution Another bit cannot be rewritten at the same time that the CE7 bit is being rewritten.

#### (2) Output waveform widths corresponding to set values

• PWM cycle = CM3  $\times$  2  $\times$  T<sub>TM7</sub>

• Dead-time width =  $T_{DTM}$  = (DTIME + 1)  $\times$  fx

• Active width of positive phase (TO70, TO72, TO74 pin)

= 
$$\{(CM3 - CM_{up}) + (CM3 - CM_{down})\} \times T_{TM7} - T_{DTM}$$

• Active width of negative phase (TO71, TO73, TO75 pin)

= 
$$(CM_{down} + CM_{up}) \times T_{TM7} - T_{DTM}$$

fx: System clock oscillation frequency

T<sub>TM7</sub>: TM7 count clock

CM<sub>up</sub>: Set value of CM0 to CM2 during TM7 count up CM<sub>down</sub>: Set value of CM0 to CM2 during TM7 count down

Caution

If a value whose active width in the positive phase or negative phase becomes 0 or negative via the above calculation, TO70 to TO75 output a waveform fixed at the inactive level with an active width of 0 (refer to Figure 8-5).

However, if CMn = 0 and BFCMn  $\geq$  CM3 are set, TO70 to TO75 output a waveform at the active level.

# (3) Operation timing

TM7 **BFCMn** b С CMn b а BFCM3 Ζ СМЗ INTTM7 INTTM7 F/F DTMn TO70, TO72, TO74 TO71, TO73, TO75

Figure 8-4. TM7 Operation Timing (Basic Operation)

**Remarks 1.** n = 0 to 2

**2.** t: Dead time = (DTIME + 1)  $\times$  fx

(fx: System clock oscillation frequency)

3. The above figure assumes an active high and undivided INTTM7 occurrence.

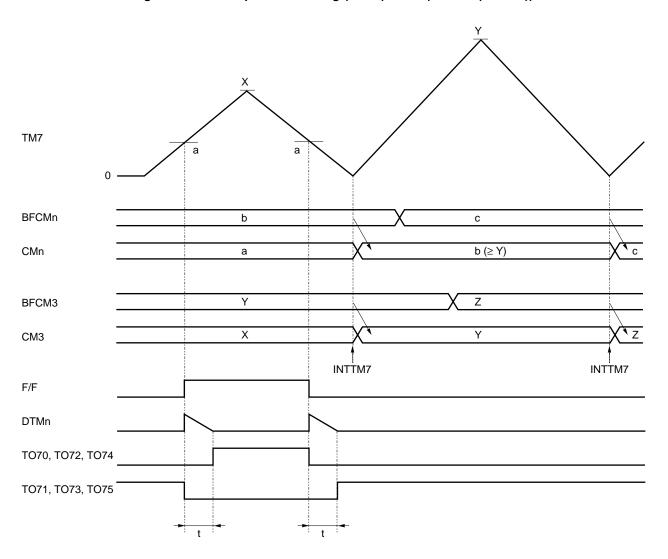

Figure 8-5. TM7 Operation Timing (CMn (BFCMn) ≥ CM3 (BFCM3))

**Remarks 1.** n = 0 to 2

2. t: Dead time = (DTIME + 1) × fx (fx: System clock oscillation frequency)

3. The above figure assumes an active high and undivided INTTM7 occurrence.

If a value higher than CM3 is set to BFCMn, low-level output in the positive phases (TO70, TO72, TO74 pins), and high-level output in the negative phases (TO71, TO73, TO75 pins) are continued. This setting is effective to output signals whose low and high widths are longer than the PWM cycle when controlling an inverter, etc.

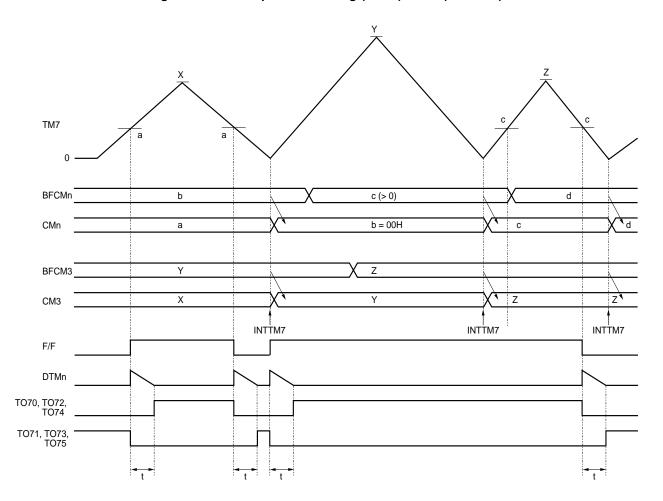

Figure 8-6. TM7 Operation Timing (CMn (BFCMn) = 000H)

**Remarks 1.** n = 0 to 2

1. 11 = 0 10 2

2. t: Dead time = (DTIME + 1)  $\times$  fx

(fx: System clock oscillation frequency)

3. The above figure assumes an active high and undivided INTTM7 occurrence.

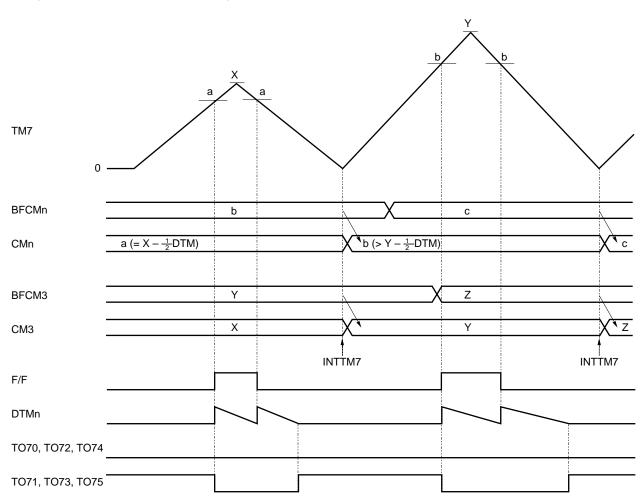

Figure 8-7. TM7 Operation Timing (CMn (BFCMn) = CM3 - 1/2DTM, CMn (BFCMn) > CM3 - 1/2DTM)

**Remarks 1.** n = 0 to 2

2. The above figure assumes an active high and undivided INTTM7 occurrence.

### **CHAPTER 9 WATCHDOG TIMER**

## 9.1 Outline of Watchdog Timer

The watchdog timer can also be used to generate a non-maskable interrupt request, maskable interrupt request, or RESET signal at preset time intervals.

## 9.2 Function of Watchdog Timer

The watchdog timer has the following functions.

- · Watchdog timer
- · Interval timer
- · Oscillation stabilization time specification

Caution Select the watchdog timer mode or interval timer mode by using the watchdog timer mode register (WDTM). (The watchdog timer and interval timer cannot be used simultaneously.)

### (1) Watchdog timer mode

The watchdog timer is used to detect an inadvertent program loop. When a loop is detected, a non-maskable interrupt request or the  $\overline{\mathsf{RESET}}$  signal can be generated.

Table 9-1. Loop Detection Time of Watchdog Timer

| Loop<br>Detection Time | At fx = 12 MHz <sup>Note</sup> | At fx = 8.38 MHz | Loop<br>Detection Time | At $f_X = 12 \text{ MHz}^{Note}$ | At fx = 8.38 MHz |
|------------------------|--------------------------------|------------------|------------------------|----------------------------------|------------------|
| $2^{12} \times 1/f_X$  | 341.3 μs                       | 488.8 μs         | $2^{16} \times 1/f_X$  | 5.46 ms                          | 7.82 ms          |
| $2^{13} \times 1/f_X$  | 682.6 μs                       | 977.6 μs         | $2^{17} \times 1/f_X$  | 10.9 ms                          | 15.6 ms          |
| $2^{14} \times 1/f_X$  | 1.36 ms                        | 1.96 ms          | $2^{18} \times 1/f_X$  | 21.8 ms                          | 31.3 ms          |
| 2 <sup>15</sup> × 1/fx | 2.73 ms                        | 3.91 ms          | 2 <sup>20</sup> × 1/fx | 87.3 ms                          | 125.1 ms         |

**Note** Expanded-specification products only.

## (2) Interval timer mode

When the watchdog timer is used as an interval timer, it generates an interrupt request at preset time intervals.

Table 9-2. Interval Time

| Interval Time          | At fx = 12 MHz <sup>Note</sup> | At $fx = 8.38 \text{ MHz}$ | Interval Time         | At fx = 12 MHz <sup>Note</sup> | At $fx = 8.38 \text{ MHz}$ |
|------------------------|--------------------------------|----------------------------|-----------------------|--------------------------------|----------------------------|
| $2^{12} \times 1/f_X$  | 341.3 μs                       | 488.8 μs                   | $2^{16} \times 1/f_X$ | 5.46 ms                        | 7.82 ms                    |
| $2^{13} \times 1/fx$   | 682.6 μs                       | 977.6 μs                   | $2^{17} \times 1/f_X$ | 10.9 ms                        | 15.6 ms                    |
| 2 <sup>14</sup> × 1/fx | 1.36 ms                        | 1.96 ms                    | $2^{18} \times 1/f_X$ | 21.8 ms                        | 31.3 ms                    |
| 2 <sup>15</sup> × 1/fx | 2.73 ms                        | 3.91 ms                    | $2^{20} \times 1/f_X$ | 87.3 ms                        | 125.1 ms                   |

Note Expanded-specification products only.

Remark fx: System clock oscillation frequency

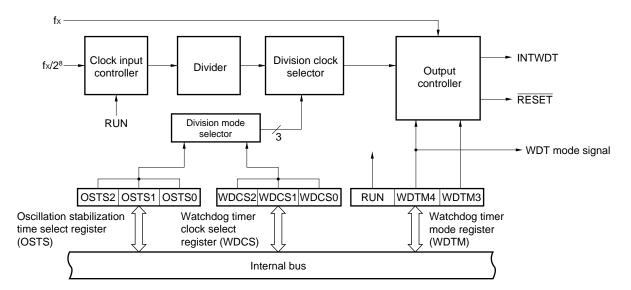

# 9.3 Configuration of Watchdog Timer

The watchdog timer includes the following hardware.

Table 9-3. Configuration of Watchdog Timer

| Item              | Configuration   |
|-------------------|---|
| Control registers | Watchdog timer clock select register (WDCS) Watchdog timer mode register (WDTM) Oscillation stabilization time select register (OSTS) |

Figure 9-1. Watchdog Timer Block Diagram

174

# 9.4 Registers Controlling Watchdog Timer

The following three registers control the watchdog timer.

- Watchdog timer clock select register (WDCS)
- Watchdog timer mode register (WDTM)
- Oscillation stabilization time select register (OSTS)

# (1) Watchdog timer clock select register (WDCS) (refer to Figure 9-2)

This register sets the overflow time of watchdog timer and interval timer. WDCS is set by an 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

## Figure 9-2. Format of Watchdog Timer Clock Select Register

| Symbol | 7 | 6 | 5 | 4 | 3 | 2     | 1     | 0     | Address | After reset | R/W |
|--------|---|---|---|---|---|-------|-------|-------|---------|-------------|-----|
| WDCS   | 0 | 0 | 0 | 0 | 0 | WDCS2 | WDCS1 | WDCS0 | FF42H   | 00H         | R/W |

| WDCS2 | WDCS1 | WDCS0 | Watcho              | Watchdog timer/interval timer overflow time selection |                  |  |  |  |
|-------|-------|-------|---------------------|---|------------------|--|--|--|
|       |       |       |                     | At fx = 12 MHz <sup>Note</sup>                        | At fx = 8.38 MHz |  |  |  |
| 0     | 0     | 0     | 2 <sup>12</sup> /fx | 341.3 <i>μ</i> s                                      | 488.8 μs         |  |  |  |
| 0     | 0     | 1     | 2 <sup>13</sup> /fx | 682.6 μs  | 977.6 μs         |  |  |  |
| 0     | 1     | 0     | 2 <sup>14</sup> /fx | 1.36 ms   | 1.96 ms          |  |  |  |
| 0     | 1     | 1     | 2 <sup>15</sup> /fx | 2.73 ms   | 3.91 ms          |  |  |  |
| 1     | 0     | 0     | 2 <sup>16</sup> /fx | 5.46 ms   | 7.82 ms          |  |  |  |
| 1     | 0     | 1     | 2 <sup>17</sup> /fx | 10.9 ms   | 15.6 ms          |  |  |  |
| 1     | 1     | 0     | 2 <sup>18</sup> /fx | 21.8 ms   | 31.3 ms          |  |  |  |
| 1     | 1     | 1     | 2 <sup>20</sup> /fx | 87.3 ms   | 125.1 ms         |  |  |  |

Note Expanded-specification products only.

## (2) Watchdog timer mode register (WDTM)

This register sets the operation mode of the watchdog timer, and enables/disables counting of the watchdog timer.

WDTM is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 9-3. Format of Watchdog Timer Mode Register

| Symbol | 7   | 6 | 5 | 4         | 3         | 2 | 1 | 0 | Address | After reset | R/W |
|--------|-----|---|---|-----------|-----------|---|---|---|---------|-------------|-----|
| WDTM   | RUN | 0 | 0 | WDTM<br>4 | WDTM<br>3 | 0 | 0 | 0 | FFF9H   | 00H         | R/W |

| WDTM4 | WDTM3 | Selection of operation mode of watchdog timer Note 1 and control of reset by watchdog timer and timer interrupt                 |
|-------|-------|---|
| 0     | ×     | Interval timer modeNote 2 (overflow and maskable interrupt request occur)/PWM output off function of TM7 by INTWDT can be used. |
| 1     | 0     | Watchdog timer mode 1 (overflow and non-maskable interrupt request occur)/PWM output off function of TM7 by INTWDT can be used. |
| 1     | 1     | Watchdog timer mode 2 (overflow occurs and reset operation started)   |

| RUN | Selection of watchdog timer operation Note 3 |
|-----|--|
| 0   | Stops counting.                              |
| 1   | Clears counter and starts counting.          |

Notes 1. Once WDTM3 and WDTM4 have been set to 1, they cannot be cleared to 0 by software.

- 2. The watchdog timer starts operating as an interval timer as soon as the RUN bit has been set to 1.
- 3. Once RUN has been set to 1, it cannot be cleared to 0 by software. Therefore, when counting is started, it cannot be stopped by any means other than RESET input.

Caution When the watchdog timer is cleared by setting RUN to 1, the actual overflow time is up to 2<sup>8</sup>/fx seconds shorter than the time set by the watchdog timer clock select register (WDCS).

Remark x: don't care

## (3) Oscillation stabilization time select register (OSTS)

This register selects the oscillation stabilization time that elapses after the RESET signal is applied or the STOP mode is released, until oscillation is stabilized.

OSTS is set by an 8-bit memory manipulation instruction.

RESET input sets this register to 04H. Therefore, to release the STOP mode by inputting the RESET signal, the time required to release the mode is  $2^{17}/fx$ .

Figure 9-4. Format of Oscillation Stabilization Time Select Register

| Symbol | 7 | 6 | 5 | 4 | 3 | 2     | 1     | 0     | Address | After reset | R/W |
|--------|---|---|---|---|---|-------|-------|-------|---------|-------------|-----|
| OSTS   | 0 | 0 | 0 | 0 | 0 | OSTS2 | OSTS1 | OSTS0 | FFFAH   | 04H         | R/W |
|        |   |   |   | 1 |   |       |       |       |         | 1           |     |

| 0                | 1     | 1                  | 2 <sup>16</sup> /fx  | 5.46 ms                        | 7.82 ms                    |  |
| 1                | 0     | 0                  | 2 <sup>17</sup> /fx  | 10.9 ms                        | 15.6 ms                    |  |
| Other than above |       | Setting prohibited |  |                                |                            |  |

Note Expanded-specification products only.

## 9.5 Operation of Watchdog Timer

### 9.5.1 Operation as watchdog timer

The watchdog timer detects an inadvertent program loop when bit 4 (WDTM4) of the watchdog timer mode register (WDTM) is set to 1.

The loop detection time interval of the watchdog timer can be selected by bits 0 to 2 (WDCS0 to WDCS2) of the watchdog timer clock select register (WDCS). By setting bit 7 (RUN) of WDTM to 1, the watchdog timer is started. Set RUN to 1 within the set loop detection time interval after the watchdog timer has been started. By setting RUN to 1, the watchdog timer can be cleared and made to start counting. If RUN is not set to 1 and the loop detection time is exceeded, the system is reset or a non-maskable interrupt request is generated by the value of bit 3 (WDTM3) of WDTM.

The watchdog timer continues operation in the HALT mode, but stops in the STOP mode. Therefore, set RUN to 1 before entering the STOP mode to clear the watchdog timer, and then execute the STOP instruction.

- ★ Cautions 1. The actual loop detection time may be up to 28/fx seconds shorter than the set time.
  - 2. The count operation of the watchdog timer is stopped when the subsystem clock is selected as the CPU clock.

Table 9-4. Loop Detection Time of Watchdog Timer

| WDCS22 | WDCS21 | WDCS20 | Loop Detection Time   | At fx = 12 MHz <sup>Note</sup> | At fx = 8.38 MHz |
|--------|--------|--------|-----------------------|--------------------------------|------------------|
| 0      | 0      | 0      | $2^{12} \times 1/f_X$ | 341.3 μs                       | 488.8 μs         |
| 0      | 0      | 1      | $2^{13} \times 1/f_X$ | 682.6 μs                       | 977.6 μs         |
| 0      | 1      | 0      | $2^{14} \times 1/f_X$ | 1.36 ms                        | 1.96 ms          |
| 0      | 1      | 1      | $2^{15} \times 1/f_X$ | 2.73 ms                        | 3.91 ms          |
| 1      | 0      | 0      | $2^{16} \times 1/f_X$ | 5.46 ms                        | 7.82 ms          |
| 1      | 0      | 1      | $2^{17} \times 1/fx$  | 10.9 ms                        | 15.6 ms          |
| 1      | 1      | 0      | $2^{18} \times 1/f_X$ | 21.8 ms                        | 31.3 ms          |
| 1      | 1      | 1      | $2^{20} \times 1/fx$  | 87.3 ms                        | 125.1 ms         |

Note Expanded-specification products only.

#### 9.5.2 Operation as interval timer

When bit 4 (WDTM4) of the watchdog timer mode register (WDTM) is set to 0, the watchdog timer operates as an interval timer that repeatedly generates an interrupt request at time intervals specified by a preset count value.

Bits 0 to 2 (WDCS0 to WDCS2) of the watchdog timer clock select register (WDCS) can be used to select the interval time of interval timer. When bit 7 (RUN) of WDTM is set to 1, the watchdog timer starts operating as an interval timer.

In the interval timer mode, the interrupt mask flag (WDTMK) and priority specification flag (WDTPR) are valid, and a maskable interrupt request (INTWDT) can be generated. The default priority of INTWDT is set as the highest of all the maskable interrupt requests.

The interval timer continues operation in the HALT mode, but stops in the STOP mode. Therefore, set RUN to 1 before entering the STOP mode to clear the interval timer, and then execute the STOP instruction.

- Cautions 1. Once bit 4 (WDTM4) of WDTM has been set to 1 (when the watchdog timer mode is selected), the interval timer mode is not set, unless the RESET signal is input.
  - 2. The interval time immediately after it has been set by WDTM may be up to  $2^8/fx$  seconds shorter than the set time.

Table 9-5. Interval Time of Interval Timer

| WDCS2 | WDCS1 | WDCS0 | Interval Time          | At fx = 12 MHz <sup>Note</sup> | At fx = 8.38 MHz |
|-------|-------|-------|------------------------|--------------------------------|------------------|
| 0     | 0     | 0     | $2^{12} \times 1/f_X$  | 341.3 μs                       | 488.8 μs         |
| 0     | 0     | 1     | $2^{13} \times 1/f_X$  | 682.6 μs                       | 977.6 μs         |
| 0     | 1     | 0     | $2^{14} \times 1/f_X$  | 1.36 ms                        | 1.96 ms          |
| 0     | 1     | 1     | $2^{15} \times 1/f_X$  | 2.73 ms                        | 3.91 ms          |

Note Expanded-specification products only.

### **CHAPTER 10 REAL-TIME OUTPUT PORT**

### 10.1 Function of Real-Time Output Port

Data set previously in the real-time output buffer register can be transferred to the output latch by hardware concurrently with timer interrupts or external interrupt request generation, then output externally. This is called the real-time output function. The pins that output data externally are called real-time output ports.

By using the real-time output port, it is possible to output a signal with no jitter. Therefore, this is most suitable for applications where an arbitrary pattern is output at an arbitrary interval (open-loop control of a stepper motor, etc.).

Also, it is possible to perform PWM modulation at a specified pin for the output pattern.

The  $\mu$ PD780988 Subseries has the following 2 channels of real-time output ports on chip. It is possible to specify the real-time output port in 1-bit units.

- 8 bits × 1, or 4 bits × 2 ... Real-time output port 0
- 6 bits × 1, or 4 bits × 1 ... Real-time output port 1

# 10.2 Configuration of Real-Time Output Port

A real-time output port includes the following hardware.

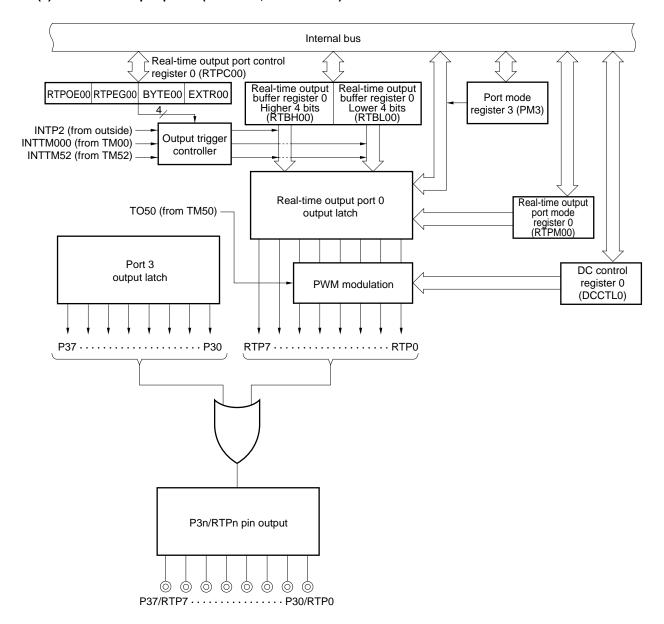

Table 10-1. Configuration of Real-Time Output Port

| Item              | Configuration                                       |
|-------------------|---|
| Register          | Real-time output buffer register n (RTBL0n, RTBH0n) |
| Control registers | Port mode register 3 (PM3)                          |
|                   | Real-time output port mode register n (RTPM0n)      |
|                   | Real-time output port control register n (RTPC0n)   |
|                   | DC control register n (DCCTLn)                      |

n = 0, 1

Figure 10-1. Block Diagram of Real-Time Output Port (1/2)

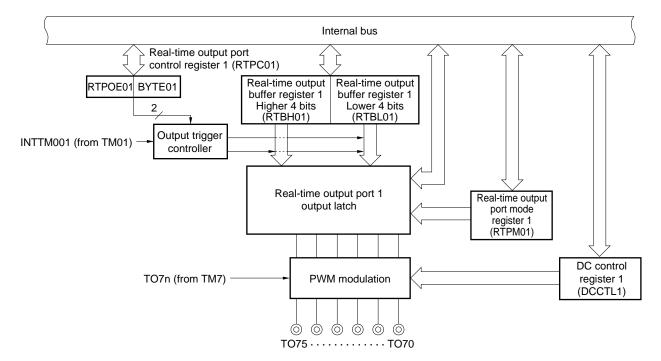

# (a) Real-time output port 0 (8 bits $\times$ 1, or 4 bits $\times$ 2)

**Remark** n = 0 to 7

Figure 10-1. Block Diagram of Real-Time Output Port (2/2)

# (b) Real-time output port 1 (6 bits $\times$ 1, or 4 bits $\times$ 1)

**Remark** n = 0 to 5

# (1) Real-time output buffer register 0 (RTBL00, RTBH00)

regardless of which address is specified.

This register consists of two 4-bit registers that hold output data in advance.

The addresses of RTBL00 and RTBH00 are mapped individually in the special function register (SFR) area as shown in Figure 10-2.

When specifying 4 bits  $\times$  2 channels as the operation mode, data is set individually in RTBL00 and RTBH00. The data of both RTBL00 and RTBH00 can be read all at once regardless of which address is specified. When specifying 8 bits  $\times$  1 channel as the operation mode, data is set to both RTBL00 and RTBH00 by writing 8-bit data to either RTBL00 or RTBH00. The data of both RTBL00 and RTBH00 can be read all at once

Figure 10-2 shows the configuration of RTBL00 and RTBH00, and Table 10-2 shows operations during manipulation of RTBL00 and RTBH00.

Figure 10-2. Configuration of Real-Time Output Buffer Register 0

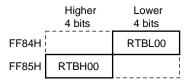

Table 10-2. Operation During Manipulation of Real-Time Output Buffer Register 0

| Operating Mode      | Register to Be | Readin        | g <sup>Note 1</sup> | WritingNote 2 |              |
|---------------------|----------------|---------------|---------------------|---------------|--------------|
|                     | Manipulated    | Higher 4 Bits | Lower 4 Bits        | Higher 4 Bits | Lower 4 Bits |
| 4 bits × 2 channels | RTBL00         | RTBH00        | RTBL00              | Invalid       | RTBL00       |
|                     | RTBH00         | RTBH00        | RTBL00              | RTBH00        | Invalid      |
| 8 bits × 1 channel  | RTBL00         | RTBH00        | RTBL00              | RTBH00        | RTBL00       |
|                     | RTBH00         | RTBH00        | RTBL00              | RTBH00        | RTBL00       |

**Notes 1.** Only the bits set in the real-time output port mode can be read. When a bit set in the port mode is read, 0 is read.

**2.** After setting data in the real-time output port, output data should be set in RTBL00 and RTBH00 by the time a real-time output trigger is generated.

# (2) Real-time output buffer register 1 (RTBL01, RTBH01)

This register consists of two 4-bit Note registers that hold output data in advance.

The addresses of RTBL01 and RTBH01 are mapped individually in the special function register (SFR) area as shown in Figure 10-3.

When specifying 4 bits  $\times$  1 channel as the operation mode, data is set in RTBL01.

When specifying 6 bits  $\times$  1 channel as the operation mode, data is set to both RTBL01 and RTBH01 by writing 6-bit data to either RTBL01 or RTBH01. The data of both RTBL01 and RTBH01 can be read all at once regardless of which address is specified.

Figure 10-3 shows the configuration of RTBL01 and RTBH01, and Table 10-3 shows operations during manipulation of RTBL01 and RTBH01.

**Note** For RTBH01, only 2 of the 4 bits are valid.

Figure 10-3. Configuration of Real-Time Output Buffer Register 1

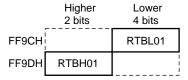

Table 10-3. Operation During Manipulation of Real-Time Output Buffer Register 1

| Operating Mode     | Register to Be | Readin        | gNote 1      | Writing       | Note 2       |
|--------------------|----------------|---------------|--------------|---------------|--------------|
| Operating Mode     | Manipulated    | Higher 2 Bits | Lower 4 Bits | Higher 2 Bits | Lower 4 Bits |
| 4 bits × 1 channel | RTBL01         | Invalid       | RTBL01       | Invalid       | RTBL01       |
| 6 bits × 1 channel | nnel RTBL01    |               | RTBL01       | RTBH01        | RTBL01       |
|                    | RTBH01         | RTBH01        | RTBL01       | RTBH01        | RTBL01       |

- Notes 1. Only the bits set in the real-time output port mode can be read. When the bit specified as RTPM01n = 0 (RTPM01n: bit n (n = 0 to 5) of real-time output port mode register 1 (RTPM01)) is read, 0 is read
  - **2.** After setting data in the real-time output port, output data should be set in RTBL01 and RTBH01 by the time a real-time output trigger is generated.

# 10.3 Registers Controlling Real-Time Output Port

The following seven types of registers control the real-time output ports.

- Port mode register 3 (PM3)
- Real-time output port mode register 0, 1 (RTPM00, RTPM01)
- Real-time output port control register 0, 1 (RTPC00, RTPC01)
- DC control register 0, 1 (DCCTL0, DCCTL1)

#### (1) Port mode register 3 (PM3)

This register sets the input/output mode of port 3 pins (P30 to P37) that function alternately as real-time output pins (RTP0 to RTP7). To use port 3 as a real-time output port, the input/output mode of the port pins used as real-time output port pins must be set in the output mode (PM3n = 0: n = 0 to 7).

PM3 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets this register to FFH.

Figure 10-4. Format of Port Mode Register 3

| Symbol | 7    | 6     | 5       | 4        | 3        | 2        | 1    | 0    | Address | After reset | R/W |
|--------|------|-------|---------|----------|----------|----------|------|------|---------|-------------|-----|

|        | PM3n | F     | 3n pin  | I/O mod  | de selec | ction (n | ')   |      |         |             |     |
|        | 0    | Outpu | ut mode | (outpu   | t buffer | on)      |      |      |         |             |     |
|        | 1    | Input | mode (  | output b | ouffer o | ff)      |      |      |         |             |     |

#### (2) Real-time output port mode register 0 (RTPM00)

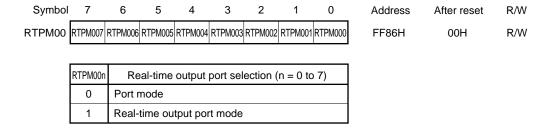

This register sets the real-time output port mode or port mode in 1-bit units.

The output is RTP0 to RTP7.

RTPM00 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 10-5. Format of Real-Time Output Port Mode Register 0

Caution When using a port as a real-time output port, set the port in the output mode (by clearing the corresponding bit of port mode register 3 (PM3) to 0).

# (3) Real-time output port mode register 1 (RTPM01)

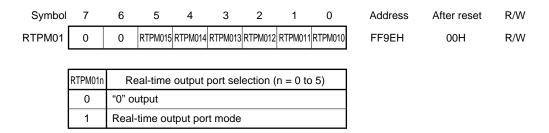

This register sets the real-time output port mode in 1-bit units.

The output is TO70 to TO75.

RTPM01 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 10-6. Format of Real-Time Output Port Mode Register 1

Caution Be sure to set bit 6 and 7 of RTPM01 to 0.

**Remark** When using as a real-time output port, TO70 to TO75 become the output.

# (4) Real-time output port control register 0 (RTPC00)

This register is used to set the operation mode, output trigger and operation enable/disable of the real-time output port.

The output is RTP0 to RTP7.

The relationship between the operation mode of the real-time output port and output trigger is as shown in Table 10-4.

RTPC00 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 10-7. Format of Real-Time Output Port Control Register 0

| 1      | 0      | 8 bits × 1 channel  | INTTM000             |                      |
| 1      | 1      |                     | INTP2                |                      |

# (5) Real-time output port control register 1 (RTPC01)

This register is used to set the operation mode, and enabling or disabling operation of the real-time output port.

The output is TO70 to TO75.

The relationship between the operation mode of the real-time output port and output trigger is as shown in Table 10-5.

RTPC01 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 10-8. Format of Real-Time Output Port Control Register 1

| Symbol | 7       | 6     | (5)      | 4                   | 3         | 2       | 1  | 0 | Address | After reset | R/W |

| BYTE01 | Real-time output port operation mode |
|--------|--------------------------------------|
| 0      | 4 bits × 1 channel                   |
| 1      | 6 bits × 1 channel                   |

Note When RTPM01n (bit n (n = 0 to 5) of real-time output port mode register 1 (RTPM01)) is 1, INV1 (bit 4 of DC control register 1 (DCCTL1)) is 0, and real-time output operation is disabled (RTPOE01 = 0), TO70 to TO75 output "0".

Table 10-5. Real-Time Output Port Operation Mode and Output Trigger

| BYTE01 | Operation Mode     | RTBH01 → Port Output | RTBL01 → Port Output |
|--------|--------------------|----------------------|----------------------|
| 0      | 4 bits × 1 channel | -                    | INTTM001             |
| 1      | 6 bits × 1 channel | INTTM001             |                      |

# (6) DC control register 0 (DCCTL0)

This register is used to enable/disable PWM modulation, and enable/disable inversion of the output waveform of the real-time output port.

The output is RTP0 to RTP7.

DCCTL0 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 10-9. Format of DC Control Register 0

| Symbol | 7     | 6      | <u>(5)</u> | 4    | 3 | 2 | 1 | 0 | Address | After reset | R/W |

| DCCTL0 | DCEN0 | PWMCH0 | PWMCL0     | INV0 | 0 | 0 | 0 | 0 | FFB8H   | 00H         | R/W |

| DCEN0 | Output operation specification |
|-------|--------------------------------|
| 0     | RTP output                     |
| 1     | PWM modulated RTP outputNote   |

| PWMCH0 | PWM modulation specification (RTP0, RTP2, RTP4 output specification) |
|--------|--|
| 0      | PWM modulation disabled  |
| 1      | PWM modulation enabled   |

|   | PWMCL0 | PWM modulation specification (RTP1, RTP3, RTP5 output specification) |
|---|--------|--|
| ſ | 0      | PWM modulation disabled  |
| ſ | 1      | PWM modulation enabled   |

| ı | INV0 | Output waveform specification |
|---|------|-------------------------------|
|   | 0    | Inversion disabled            |
|   | 1    | Inversion enabled             |

Note The PWM signal uses the TO50 output.

**Remarks 1.** The output is RTP0 to RTP7.

2. The PWMCH0, PWMCL0, and INV0 settings are valid only when DCEN0 = 1.

# (7) DC control register 1 (DCCTL1)

This register is used to enable/disable PWM modulation, and enable/disable inversion of the output waveform of the real-time output port.

The output is TO70 to TO75.

DCCTL1 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 10-10. Format of DC Control Register 1

| Symbol | 7     | 6      | 5      | 4    | 3 | 2 | 1 | 0 | Address | After reset | R/W |

|--------|--|
| 0      | PWM modulation disabled  |
| 1      | PWM modulation enabled   |

| PWMCL1 | PWM modulation specification (TO71, TO73, TO75 output specification) |
|--------|--|
| 0      | PWM modulation disabled  |
| 1      | PWM modulation enabled   |

|   | INV1 | Output waveform specification |
|---|------|-------------------------------|
| ſ | 0    | Inversion disabled            |
|   | 1    | Inversion enabled             |

**Note** The PWM signal uses the inverter timer output (TO70 to TO75).

**Remarks 1.** The output is TO70 to TO75.

2. The PWMCH1, PWMCL1, and INV1 settings are valid only when DCEN1 = 1.

#### 10.4 Operation of Real-Time Output Port

# (1) Using RTP0 to RTP7 as the real-time output port ..... Real-time output port 0 (8 bits $\times$ 1, or 4 bits $\times$ 2)

When bit 7 (RTPOE00) of real-time output port control register 0 (RTPC00) is 1, and real-time output operation is enabled, the data in real-time output buffer register 0 (RTBH00, RTBL00) is transferred to the output latch in synchronization with the generation of the selected transfer trigger (set by EXTR00 and BYTE00). Of the transferred data, only the data of the bit specified for the real-time output port by setting real-time output port mode register 0 (RTPM00) is output from bits RTP0 to RTP7. The ports specified as port mode by RTPM00 can be used as general-purpose input/output ports.

The operation mode can be selected as 8 bits  $\times$  1, or 4 bits  $\times$  2, by setting EXTR00 and BYTE00. By setting INV0, it is possible to invert the output waveform. Also, by setting PWMCL0 and PWMCH0, it is possible to perform PWM modulation of the output pattern.

If real-time output was disabled (RTPOE00 = 0) when RTPM00n = 1 and INV0 = 0, then RTP0 to RTP7 output 0.

The relationship between the settings for each bit of the control register and the real-time output is shown in Table 10-6, and an example of the operation timing is shown in Figure 10-11.

Remark EXTR00: Bit 4 of real-time output port control register 0 (RTPC00)

BYTE00: Bit 5 of real-time output port control register 0 (RTPC00)

INV0: Bit 4 of DC control register 0 (DCCTL0)

PWMCL0, PWMCH0: Bits 5 and 6 of DC control register 0 (DCCTL0)

RTPM00n: Bit n (n = 0 to 7) of real-time output port mode register 0 (RTPM00)

Table 10-6. Relationship Between Settings of Each Bit of Control Register and Real-Time Output

| PM3n | P3n | DCEN0 | INV0 | PWMCH0/<br>PWMCL0 | RTPOE00 | RTPM00n | RTBH00m/<br>RTBL00m | Pin P3n Status |

# (2) Using TO70 to TO75 as a real-time output port ..... Real-time output port 1 (6 bits $\times$ 1, or 4 bits $\times$ 1)

If real-time output is enabled when bit 7 (RTPOE01) of real-time output port control register 1 (RTPC01) is 1, the data of real-time output buffer register 1 (RTBH01, RTBL01) is transferred to the output latch in synchronization with the generation of INTTM001. Of the transferred data, only the data of the bit specified as the real-time output port by setting real-time output port mode register 1 (RTPM01) is output from bits TO70 to TO75. It is possible to use TO70 to TO75 as inverter timer output when inverter timer output is specified by DCEN1.

The operation mode can be selected as 6 bits  $\times$  1, or 4 bits  $\times$  1, by setting BYTE01.

By setting INV1, it is possible to invert the output waveform. Also, by setting PWMCL1 and PWMCH1, it is possible to perform PWM modulation of the output pattern.

If real-time output was disabled (RTPOE01 = 0) when RTPM01n = 1 and INV1 = 0, then TO70 to TO75 output 0.

The relationship between the settings for each bit of the control register and the real-time output is shown in Table 10-7, and an example of the operation timing is shown in Figure 10-12.

Remark BYTE01: Bit 5 of real-time output port control register 1 (RTPC01)

DCEN1: Bit 7 of DC control register 1 (DCCTL1)
INV1: Bit 4 of DC control register 1 (DCCTL1)

PWMCL1, PWMCH1: Bits 5 and 6 of DC control register 1 (DCCTL1)

RTPM01n: Bit n (n = 0 to 5) of real-time output port mode register 1 (RTPM01)

Table 10-7. Relationship Between Settings of Each Bit of Control Register and Real-Time Output

| CE7 | DCEN1 | INV1 | PWMCH1/<br>PWMCL1 | RTPOE01 | RTPM01n | RTBH01m/<br>RTBL01m | Pin TO7n Status |
|-----|-------|------|-------------------|---------|---------|---------------------|-----------------|

## 10.5 Using Real-Time Output Port

When using the real-time output port, perform the following steps.

(1) Disable real-time output operation.

Clear bit 7 (RTPOE0n) of real-time output port control register n (RTPC0n) to 0.

- (2) Initial setting
  - Set the initial value to the port output latch (real-time output port 0 only).
  - Specify the real-time output port mode in 1-bit units.
     Set real-time output port mode register n (RTPM0n).
  - Select the operation mode (trigger and a valid edge).
     Set bits 4, 5, and 6 (EXTR00, BYTE00, and RTPEG00) of RTPC00 or set bit 5 (BYTE01) of RTPC01.
  - For real-time output port 0, set an initial value equal to the port output latch in real-time output buffer register 0 (RTBH00, RTBL00).

For real-time output port 1, set an initial value in real-time output buffer register 1 (RTBH01, RTBL01).

- Set DC control register n (DCCTLn).
- (3) Enable the real-time output operation.

RTPOE0n = 1

- (4) Set the port output latch to 0 (only for real-time output port 0).
  - **Remark** For real-time output port 0, the value output by the real-time output operation is the ORed value of the output latch of the port and real-time output (see **Figure 10-1 (a)**). Therefore, when real-time output port 0 is used, the port output latch should be set to 0 after the real-time output operation is enabled (RTPOE00 =  $0 \rightarrow 1$ ) until the first transfer trigger is generated.
- (5) Set the next output to RTBH0n and RTBL0n before the selected transfer trigger is generated.
- (6) Sequentially set the next real-time output value to RTBH0n and RTBL0n by using the interrupt servicing corresponding to the selected trigger.

Remark n = 0, 1

#### 10.6 Notes on Real-Time Output Port

- (1) Before performing the initial setting, disable the real-time output operation by clearing bit 7 (RTPOE0n) of real-time output port control register n (RTPC0n) to 0 (n = 0, 1).
- (2) Once the real-time output operation has been disabled (RTPOE0n = 0), be sure to set the same initial value as the output latch to real-time output buffer register n (RTBH0n and RTBL0n) before enabling the real-time output operation (RTPOE0n =  $0 \rightarrow 1$ ) (n = 0, 1).

#### **CHAPTER 11 A/D CONVERTER**

#### 11.1 Function of A/D Converter

The A/D converter converts analog input signals into digital values, and consists of eight channels (ANI0 to ANI7) with a resolution of 10 bits.

This A/D converter is of successive approximation type, and the result of conversion is held by 10-bit A/D conversion result register 0 (ADCR0).

A/D conversion can be started in the following two ways.

#### (1) Hardware start

Conversion is started by trigger input (ADTRG; rising edge, falling edge, or both rising and falling edges can be specified).

#### (2) Software start

Conversion is started by setting A/D converter mode register 0 (ADM0).

One analog input channel is selected from ANI0 to ANI7 and A/D conversion is executed. A/D conversion is stopped, if it was started by means of hardware, after the conversion is complete, and an interrupt request (INTAD0) is generated. When A/D conversion is started by software, conversion is repeatedly performed. Each time conversion is completed once, INTAD0 is generated.

#### 11.2 Configuration of A/D Converter

The A/D converter includes the following hardware.

Table 11-1. Configuration of A/D Converter

| Item              | Configuration  |
|-------------------|--|
| Analog input      | 8 channels (ANI0 to ANI7)  |
| Control registers | A/D converter mode register 0 (ADM0)  Analog input channel specification register 0 (ADS0) |
| Registers         | Successive approximation register (SAR) A/D conversion result register 0 (ADCR0)           |

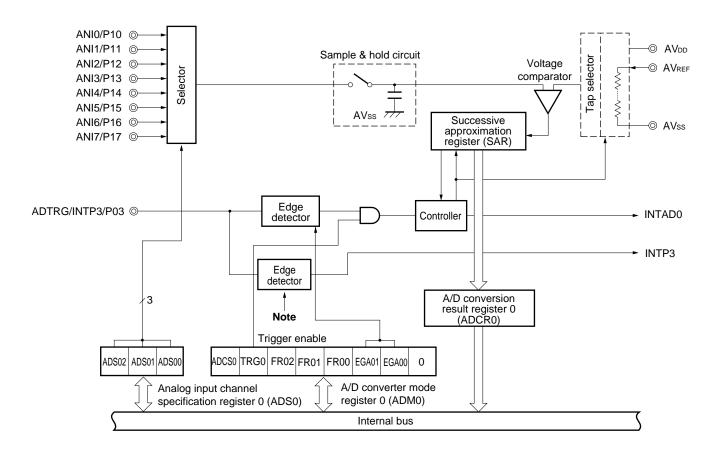

Figure 11-1. A/D Converter Block Diagram

Note Specify the valid edge by using bit 3 (EGP3, EGN3) of the external interrupt rising/falling edge enable registers (EGP, EGN) (refer to Figure 14-5 Format of External Interrupt Rising Edge Enable Register and External Interrupt Falling Edge Enable Register).

#### (1) Successive approximation register (SAR)

This register compares the voltage value of an analog input with the value of a voltage tap (compare voltage) from the series resistor string, and holds the result of the comparison starting from the most significant bit (MSB).

When the result is held down to the least significant bit (LSB) (end of A/D conversion), the contents of SAR are transferred to A/D conversion result register 0 (ADCR0).

#### (2) A/D conversion result register 0 (ADCR0)

This is a 16-bit register that stores the results of A/D conversion. The lower 6 bits are fixed to 0. Every time an A/D conversion is complete, the conversion results are loaded from the successive approximation register (SAR). The loaded data is stored in ADCR0 in order from the most significant bit (MSB).

ADCR0 is read with a 16-bit memory manipulation instruction.

RESET input makes the contents of this register undefined.

| * | Symbol _ | FF19H |  |  |  |  |  | <br>FF18H |  |  |   |   |   |   |   | After reset | R/W    |           |   |
|---|----------|-------|--|--|--|--|--|-----------|--|--|---|---|---|---|---|-------------|--------|-----------|---|
|   | ADCR0    |       |  |  |  |  |  |           |  |  | 0 | 0 | 0 | 0 | 0 | 0           | FF18H, | Undefined | R |

# Caution When a write operation is performed on A/D converter mode register 0 (ADM0) and analog input channel specification register 0 (ADS0), the contents of ADCR0 may become undefined. Read the conversion results after the conversion operation is complete and before the write operation to ADM0 and ADS0. Correct conversion results may not read out at a timing other than the above.

#### (3) Sample & hold circuit

The sample & hold circuit samples analog input signals sequentially sent from the input circuit on a one-by-one basis, and sends the sampled signals to the voltage comparator. This circuit holds the sampled analog input voltage value during A/D conversion.

#### (4) Voltage comparator

The voltage comparator compares the analog input with the output voltage of the series resistor string.

# (5) Series resistor string

The series resistor string is connected between AVREF and AVss and generates the voltage to be compared with the analog input.

#### (6) ANIO to ANI7 pins

These are the eight analog input pin channels of the A/D converter. They input the analog signals that are converted to digital values.

- Cautions 1. Observe the rated input voltage range of ANI0 to ANI7. If a voltage of AVREF or higher, or AVss or lower (even within the range of absolute maximum ratings) is applied to a channel, the converted value of that channel becomes undefined, or the converted value of the other channels may be affected.
  - The analog input pins (ANI0 to ANI7) are also used as input port pins (P10 to P17).
     When A/D conversion is performed with any of ANI0 to ANI7 selected, do not execute the input instruction to port 1 while conversion is in progress; otherwise, the conversion resolution may be degraded.

If a digital pulse is applied to the pins adjacent to the pin currently being used for A/D conversion, the expected value of the A/D conversion may not be obtained due to coupling noise. Therefore, do not apply a pulse to the adjacent pins to the pin under going A/D conversion.

#### (7) AVREF pin

This pin inputs a reference voltage to the A/D converter.

Based on the voltage applied between AVREF and AVss, the signal input to ANI0 to ANI7 is converted into a digital signal.

Caution A series resistor string of several 10 k $\Omega$  is connected between the AVREF and AVss pins. If the output impedance of the reference voltage source is high, therefore, the error of the reference voltage increases by connecting the impedance in series with the series resistor string between the AVREF and AVss pins.

#### (8) AVss pin

This is the ground pin of the A/D converter. Always make this pin the same potential as the Vsso pin even when the A/D converter is not used.

# (9) AVDD pin

This is the analog power supply pin of the A/D converter. Always make this pin the same potential as the VDDO pin even when the A/D converter is not used.

# 11.3 Registers Controlling A/D Converter

The following two registers control the A/D converter.

- A/D converter mode register 0 (ADM0)
- Analog input channel specification register 0 (ADS0)

# (1) A/D converter mode register 0 (ADM0)

This register sets conversion time of an analog input to be converted into a digital value, starts/stops the conversion operation, and sets an external trigger.

ADM0 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

**Notes 1.** Set the A/D conversion time so that it satisfies the following ratings.

<Expanded-specification products>

 $4.5 \text{ V} \leq \text{AV}_{\text{DD}} \leq 5.5 \text{ V}$ : 12  $\mu$ s or higher

4.0 V  $\leq$  AV<sub>DD</sub> < 4.5 V: 14  $\mu$ s or higher

3.0 V  $\leq$  AVDD < 4.0 V: 17  $\mu s$  or higher

<Conventional products>

 $4.0 \text{ V} \leq \text{AV}_{\text{DD}} \leq 5.5 \text{ V}$ : 14  $\mu$ s or higher

- 2. Expanded-specification products only
- Setting prohibited because the A/D conversion time cannot satisfy the ratings in Note 1 during operation under these conditions.

Caution When rewriting other than the same data to FR00 to FR02, temporarily stop A/D conversion and then rewrite.

Remark fx: System clock oscillation frequency

# (2) Analog input channel specification register 0 (ADS0)

This register sets the input port of the analog voltage to be converted into a digital value. ADS0 is set by an 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 11-3. Format of Analog Input Channel Specification Register 0

|      |   |   |   |   |   |       |       |       |       | After reset | R/W |

#### 11.4 Operation of A/D Converter

# 11.4.1 Basic operation of A/D converter

- <1> Select one channel for A/D conversion using analog input channel specification register 0 (ADS0).
- <2> The voltage input to the selected analog input channel is sampled by the sample & hold circuit.
- <3> When the voltage has been sampled for a specific time, the sample & hold circuit enters the hold status, and holds the input analog voltage until A/D conversion is completed.
- <4> Bit 9 of the successive approximation register (SAR) is set. The voltage tap of the series resistor string is set to (1/2) AVREF by the tap selector.
- <5> The voltage differential between the voltage tap of the series resistor string and the analog input is compared by the voltage comparator. If the analog input is higher than (1/2) AVREF, the MSB of the SAR remains set. If it is less than (1/2) AVREF, the MSB is reset.
- <6> Next, bit 8 of the SAR is automatically set, and the next voltage differential is compared. Here the voltage tap of the series resistor string is selected as follows, according to the value of bit 9 to which the result of the first comparison has already been set.
  - Bit 9 = 1: (3/4) AVREF
  - Bit 9 = 0: (1/4) AVREF

This voltage tap and analog input voltage are compared, and bit 8 of the SAR is manipulated as follows, according to the result of the comparison.

- Analog input voltage ≥ voltage tap: Bit 8 = 1
- Analog input voltage < voltage tap: Bit 8 = 0
- <7> In this way, all the bits of the SAR, including bit 0, are compared.
- <8> When all the 10 bits of the SAR have been compared, the SAR holds the valid digital results, which are then transferred and latched to A/D conversion result register 0 (ADCR0).

At the same time, an A/D conversion end interrupt request (INTAD0) can be generated.

Caution The first A/D conversion value immediately after starting the A/D conversion operation may not satisfy ratings.

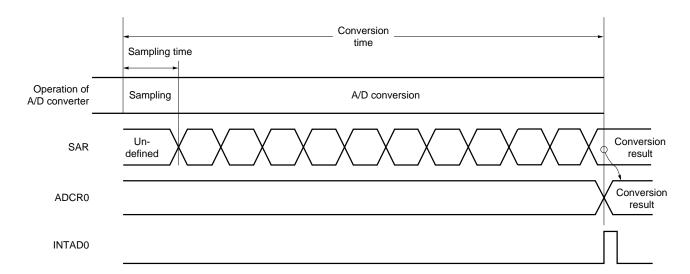

Figure 11-4. Basic Operation of A/D Converter

A/D conversion is performed continuously, until bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) is reset to 0 by software.

If the data of ADM0 or analog input channel specification register 0 (ADS0) is rewritten during A/D conversion, the conversion is initialized. If the ADCS0 bit is set to 1 at this time, conversion is performed again from the start. RESET input makes the contents of A/D conversion result register 0 (ADCR0) undefined.

#### 11.4.2 Input voltage and conversion result

The relationship between the analog voltage input to the analog input pins (ANI0 to ANI7) and A/D conversion result (value stored in A/D conversion result register 0 (ADCR0)) is as follows.

ADCR0 = INT 
$$\left(\frac{V_{IN}}{AV_{REF}} \times 1,024 + 0.5\right)$$

or,

$$(\mathsf{ADCR0} - 0.5) \times \frac{\mathsf{AV_{REF}}}{1,024} \le \mathsf{Vin} < (\mathsf{ADCR0} + 0.5) \times \frac{\mathsf{AV_{REF}}}{1,024}$$

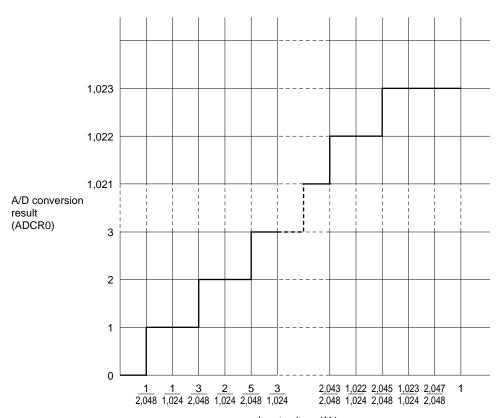

Remark INT(): Function returning integer of value in parentheses

Vin: Analog input voltage AVREF: AVREF pin voltage

ADCR0: Value of A/D conversion result register 0 (ADCR0)

Figure 11-5 shows the relationship between the analog input voltage and A/D conversion result.

Figure 11-5. Relationship Between Analog Input Voltage and A/D Conversion Result

#### 11.4.3 Operation mode of A/D converter

One analog input channel is selected from ANI0 to ANI7 for A/D conversion using analog input channel specification register 0 (ADS0).

A/D conversion can be started in the following two ways.

- Hardware start: Conversion is started by trigger input (ADTRG; rising edge/falling edge, or both rising and falling edges can be specified).
- Software start: Conversion is started by setting A/D converter mode register 0 (ADM0).

The result of the A/D conversion is stored in A/D conversion result register 0 (ADCR0), and at the same time, an interrupt request signal (INTAD0) is generated.

#### (1) A/D conversion operation by hardware start

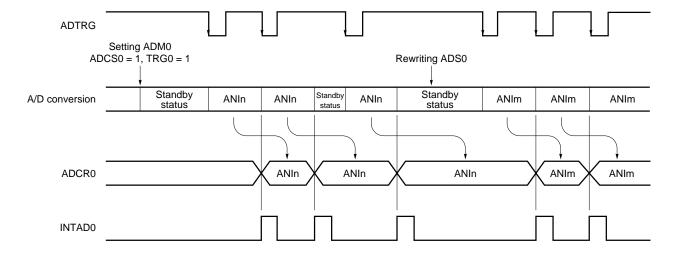

The A/D conversion operation is in standby when both bits 6 (TRG0) and 7 (ADCS0) of A/D converter mode register 0 (ADM0) are set to 1. When an external trigger signal (ADTRG) is input, the voltage applied to the analog input pin specified by analog input channel specification register 0 (ADS0) is converted into a digital value. When A/D conversion is complete, the result of the conversion is stored in A/D conversion result register 0 (ADCR0), and an interrupt request signal (INTAD0) is generated. Once A/D conversion is started and when one A/D conversion is complete, the next A/D conversion is not started unless a new external trigger signal is input.

If ADS0 is rewritten during A/D conversion, the AD conversion under execution is stopped, and stands by until a new external trigger signal is input. When the external trigger signal is input, A/D conversion is performed again from the start. If ADS0 is rewritten while the A/D converter is standing by, the new A/D conversion operation will be started when the next external trigger signal is input.

When 0 is written to the ADCS0 bit of ADM0 during A/D conversion, the conversion is immediately stopped.

Caution When P03/INTP3/ADTRG is used as an external trigger input (ADTRG), specify the valid edge by using bits 1 and 2 (EGA00 and EGA01) of A/D converter mode register 0 (ADM0) and set the interrupt mask flag (PMK3) to 1.

Figure 11-6. A/D Conversion by Hardware Start (with Falling Edge Specified)

**Remark** n = 0, 1, ..., 7m = 0, 1, ..., 7

# (2) A/D conversion by software start

By setting bit 6 (TRG0) of A/D converter mode register 0 (ADM0) to 0 and setting bit 7 (ADCS0) to 1, the voltage applied to the analog input pin specified by analog input channel specification register 0 (ADS0) is converted into a digital value.

When A/D conversion is complete, the result of the conversion is stored in A/D conversion result register 0 (ADCR0), and an interrupt request signal (INTAD0) is generated. When A/D conversion is started once, and one A/D conversion is complete, the next A/D conversion is immediately started. In this way, A/D conversion is repeatedly executed until new data is written to ADS0.

If ADS0 is rewritten during A/D conversion, the conversion under execution is stopped, and A/D conversion of the newly selected analog input channel is started.

If data whose ADCS0 is 0 is written to ADM0 during A/D conversion, the conversion is immediately stopped.

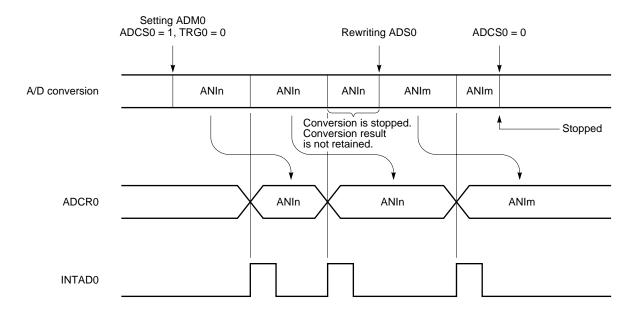

Figure 11-7. A/D Conversion by Software Start

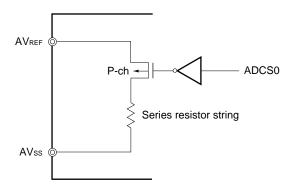

**Remark** n = 0, 1, ..., 7m = 0, 1, ..., 7

#### 11.5 Notes on A/D Converter

#### (1) Current consumption in standby mode

The A/D converter stops operating in the standby mode. At this time, the current consumption can be reduced by stopping the conversion operation (by clearing bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) to 0). An example of reducing the current consumption in standby mode is shown in Figure 11-8.

Figure 11-8. Example of Reducing Current Consumption in Standby Mode

# (2) ANIO to ANI7 input range

Observe the rated range of the ANI0 to ANI7 input voltage. If a voltage of AVREF or higher, or AVss or lower (even within the range of absolute maximum ratings) is input to an analog input channel, the converted value of that channel becomes undefined. In addition, the converted values of the other channels may also be affected.

# (3) Conflict

<1> Conflict between writing A/D conversion result register 0 (ADCR0) on completion of conversion and reading ADCR0 by instruction

Reading ADCR0 has priority. After it has been read, a new conversion result is written to ADCR0.

- <2> Conflict between writing ADCR0 on completion of conversion and external trigger signal input The external trigger signal is not acknowledged during A/D conversion. Therefore, the external trigger signal is not acknowledged while ADCR0 is being written.
- <3> Conflict between writing ADCR0 on completion of conversion and writing A/D converter mode register 0 (ADM0) or writing analog input channel specification register 0 (ADS0)
  Writing ADM0 or ADS0 has priority. ADCR0 is not written. The conversion end interrupt request signal (INTAD0) is not generated.

#### (4) Countermeasures against noise

To keep the resolution of 10 bits, noise superimposed on the AVREF and ANI0 to ANI7 pins must be suppressed as much as possible. The higher the output impedance of the analog input source, the greater the effect. To suppress noise, connecting an external capacitor as shown in Figure 11-9 is recommended.

Reference voltage input

C = 100 to 1000 pF

AVREF

AVSS

VSSO

AVSS

VSSO

Figure 11-9. Processing Analog Input Pin

#### (5) ANIO/P10 to ANI7/P17

The analog input pins (ANI0 to ANI7) are also used as input port pins (P10 to P17).

When A/D conversion is performed with any of ANI0 to ANI7 selected, do not execute the input instruction to port 1 while conversion is in progress; otherwise, the conversion resolution may be degraded.

If a digital pulse is applied to the pins adjacent to the pin currently being used for A/D conversion, the expected value of the A/D conversion may not be obtained due to coupling noise. Therefore, do not apply a pulse to the pins adjacent to the pin under going A/D conversion.

# (6) Input impedance of ANI0 to ANI7 pins

This A/D converter charges the internal sampling capacitor for about 1/10 of the conversion time, and performs sampling.

Therefore at times other than sampling, only the leak current is output. During sampling, the current for charging the capacitor is also output, so the input impedance fluctuates and has no meaning.

However, to ensure adequate sampling, it is recommended that the output impedance of the analog input source be set to below 10 k $\Omega$ , or a 100 pF capacitor be connected to the ANI0 to ANI7 pins (see **Figure 11-9**).

#### (7) Input impedance to AVREF pin

A series resistor string of several 10 k $\Omega$  is connected between the AVREF and AVSS pins.

If the output impedance of the reference voltage source is high, therefore, the reference voltage error increases when connecting the impedance in series with the series resistor string between the AVREF and AVss pins.

#### (8) Interrupt request flag (ADIF)

The interrupt request flag (ADIF) is not cleared even when the contents of analog input channel specification register 0 (ADS0) are changed.

When the analog input pin is changed during A/D conversion, therefore, the chances are that the A/D conversion result of the old analog input and interrupt request flags was set immediately before the contents of ADS0 was rewritten. Consequently, ADIF may be set even if A/D conversion for the newly specified analog input pin has not yet been completed when ADIF is read immediately after ADS0 has been rewritten (refer to **Figure 11-10**).

To resume A/D conversion once it has been stopped, clear ADIF first.

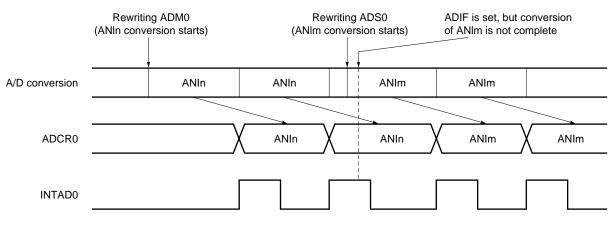

Figure 11-10. A/D Conversion End Interrupt Request Generation Timing

**Remark** n = 0, 1, ....., 7n = 0, 1, ....., 7

# (9) AVDD pin

The AV<sub>DD</sub> pin is the power supply pin to the analog circuit and supplies power to the input circuit of ANI0/P10 to ANI7/P17.

Therefore, even in applications that can be switched over to a backup power source, be sure to apply the same voltage as V<sub>DD0</sub> as shown in Figure 11-11.

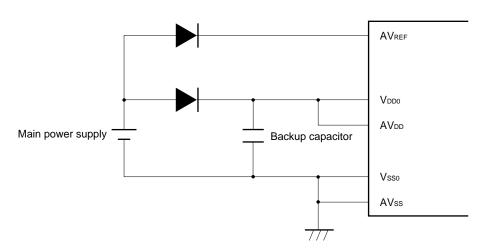

Figure 11-11. Processing of AVDD Pin

#### (10) Conversion result immediately after start of A/D conversion

The first A/D conversion value immediately after starting the A/D conversion operation may not satisfy the ratings.

Poll the A/D conversion end interrupt request (INTAD0) and discard the first conversion result.

#### (11) Reading A/D conversion result register 0 (ADCR0)

When performing a write operation to A/D converter mode register 0 (ADM0) and analog input channel specification register 0 (ADS0), the contents of ADCR0 may become undefined. Read the conversion results after the conversion operation is complete and before the write operation to ADM0 and ADS0. Correct conversion results may not be read out at a timing other than the above.

# (12) Timing at which A/D conversion result is undefined

The A/D conversion value may be undefined if the timing of completion of A/D conversion and the timing of stopping the A/D conversion conflict. Therefore, read the A/D conversion result during the A/D conversion operation. To read the conversion result after stopping the A/D conversion operation, be sure to stop the A/D conversion before the next conversion ends.

Figures 11-12 and 11-13 show the timing of reading the conversion result.

Figure 11-12. Timing of Reading Conversion Result (When Conversion Result Is Undefined)

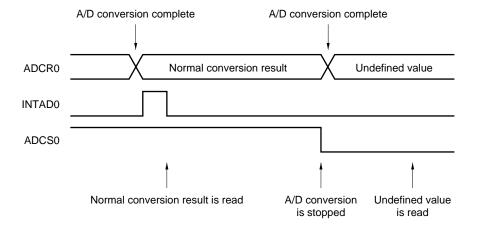

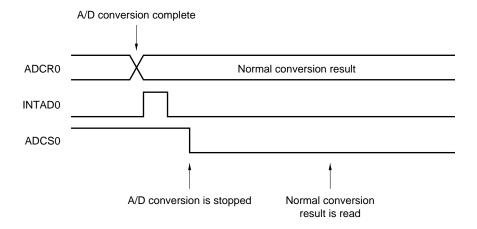

Figure 11-13. Timing of Reading Conversion Result (When Conversion Result Is Normal)

#### (13) Notes on board design

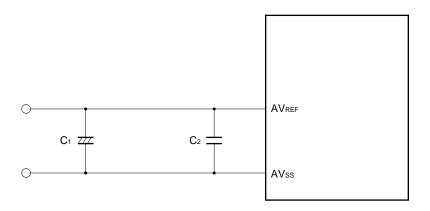

Locate analog circuits as far away from digital circuits as possible on the board because the analog circuits may be affected by the noise of the digital circuits. In particular, do not cross an analog signal line with a digital signal line, or wire an analog signal line in the vicinity of a digital signal line. Otherwise, the A/D conversion characteristics may be affected by the noise of the digital line.

Connect AVsso and Vsso at one location on the board where the voltages are stable.

## (14) AVREF pin

Connect a capacitor to the AV<sub>REF</sub> pin to minimize conversion errors due to noise. If an A/D conversion operation has been stopped and is then started, the voltage applied to the AV<sub>REF</sub> pin becomes unstable, causing the accuracy of the A/D conversion to drop. To prevent this, also connect a capacitor to the AV<sub>REF</sub> pin. Figure 11-14 shows an example of connecting a capacitor.

Figure 11-14. Example of Connecting Capacitor to AVREF Pin

**Remark** C1: 4.7  $\mu$ F to 10  $\mu$ F (reference value)

C2: 0.01  $\mu$ F to 0.1  $\mu$ F (reference value)

Connect C2 as close to the pin as possible.

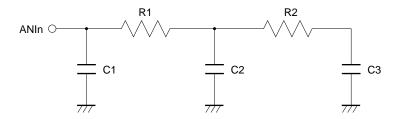

## (15) Internal equivalent circuit of ANI0 to ANI7 pins and permissible signal source impedance

To complete sampling within the sampling time with sufficient A/D conversion accuracy, the impedance of the sensor or other signal source must be sufficiently low. Figure 11-15 shows the internal equivalent circuit of the ANI0 to ANI7 pins.

If the impedance of the signal source is high, connect capacitors with a high capacitance to pins ANI0 to ANI7. An example of this is shown in Figure 11-16. In this case, however, the microcontroller cannot follow an analog signal with a high differential coefficient because a lowpass filter is created.

To convert a high-speed analog signal or to convert an analog signal in the scan mode, insert a low-impedance buffer.

Figure 11-15. Internal Equivalent Circuit of Pins ANI0 to ANI7

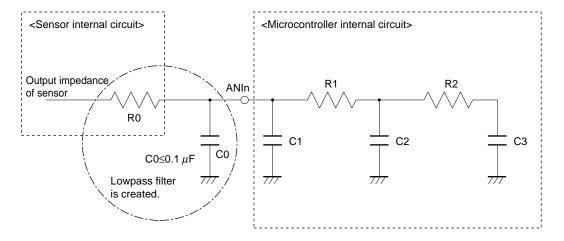

**Remark** n = 0 to 7

Table 11-2. Resistances and Capacitances of Equivalent Circuit (Reference Values)

| AVREF | R1    | R2     | C1   | C2     | C3   |
|-------|-------|--------|------|--------|------|
| 2.7 V | 12 kΩ | 8 kΩ   | 8 pF | 3 pF   | 2 pF |
| 4.5 V | 4 kΩ  | 2.7 kΩ | 8 pF | 1.4 pF | 2 pF |

Caution The resistances and capacitances in Table 11-2 are not guaranteed values.

Figure 11-16. Example of Connection if Signal Source Impedance Is High

**Remark** n = 0 to 7

#### 11.6 How to Read A/D Converter Characteristics Tables

This section describes the technical terms peculiar to the A/D converter.

#### (1) Resolution

This is the minimum identifiable analog input voltage. The ratio of 1 digital output bit to an analog input voltage is said to be 1 LSB (Least Significant Bit). The ratio of the full scale to 1 LSB is expressed in %FSR (Full Scale Range).

Where the resolution is 10 bits,

$$1 LSB = 1/2^{10} = 1/1024$$
  
= 0.098% FSR

The accuracy does not depend on the resolution and is determined by the overall error.

#### (2) Overall error

This is the maximum difference between actually measured and theoretical values.

The overall error indicates a zero-scale error and full-scale error, an integral linearity error, differential linearity error, and a combination of these errors.

Note that the overall error specified in the characteristics table does not include the quantization error.

#### (3) Quantization error

This is an error of  $\pm 1/2$  LSB that inevitably occurs when an analog value is converted into a digital value. Since the A/D converter converts an analog input voltage in the range of  $\pm 1/2$  LSB into the same digital code, a quantization error is unavoidable.

This error is not included in the overall error, zero-scale error, full-scale error, integral linearity error, and differential linearity error specified in the characteristics table.

Figure 11-17. Overall Error

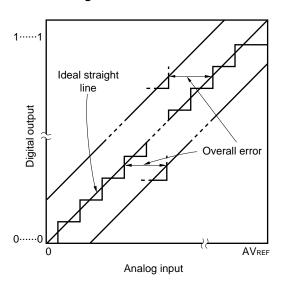

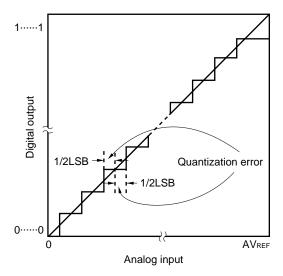

Figure 11-18. Quantization Error

#### (4) Zero-scale error

This is the difference between the actually measured value and the theoretical value (1/2 LSB) of an analog input voltage when the digital output changes from 0...000 to 0...001. If the measured value is greater than the theoretical value, it is the difference between the actually measured value and the theoretical value (3/2 LSB) of the analog input voltage when the digital output changes from 0...001 to 0...010.

#### (5) Full-scale error

This is the difference between the actually measured value and the theoretical value (full scale -3/2 LSB) of an analog input voltage when the digital output changes from 1...110 to 1...111.

#### (6) Integral linearity error

This is the degree to which the conversion characteristics shift from the ideal straight line. It indicates the maximum difference between the measured value and the ideal straight line where the zero-scale error and full-scale error are 0.

#### (7) Differential linearity error

This is the difference between the actually measured value and the theoretical value of an input voltage when the conversion result changes from a certain value by 1. The differential linearity error indicates the degree of dispersion (relative drift) of input voltage variation required when changing from each conversion value in comparison to the integral linearity error that indicates the absolute value of the drift from the theoretical value.

Figure 11-19. Zero-Scale Error

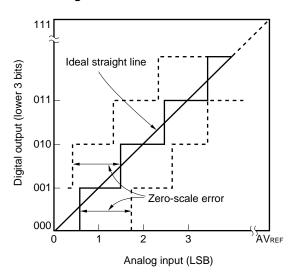

Figure 11-20. Full-Scale Error

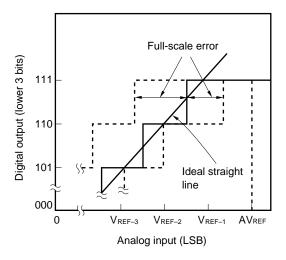

Figure 11-21. Integral Linearity Error

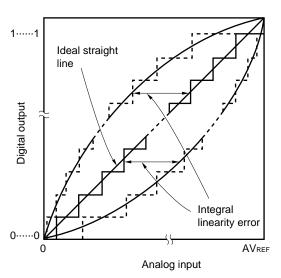

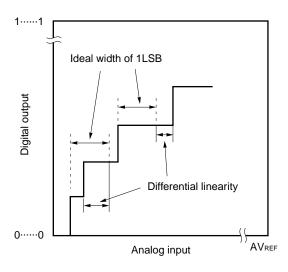

Figure 11-22. Differential Linearity Error

## (8) Conversion time

Time required from when an analog input voltage is given until the digital output is obtained. Sampling time is included in the conversion time in the characteristics table.

# (9) Sampling time

Time during which an analog switch is on to load an analog voltage to the sample & hold circuit.

#### **CHAPTER 12 SERIAL INTERFACES UART00 AND UART01**

#### 12.1 Function of Serial Interfaces

Serial interfaces UART00 and UART01 have the following three modes.

- · Operation stop mode
- · Asynchronous serial interface (UART) mode
- Infrared data transfer mode (UART00 only)

# (1) Operation stop mode

This mode is used when serial transfer is not carried out, and is to reduce power consumption.

## (2) Asynchronous serial interface (UART) mode

In this mode, one byte of data is transmitted/received following the start bit, and full-duplex operation is possible.

A dedicated UART baud rate generator is incorporated, allowing communication over a wide range of baud rates.

Programming baud rate generator control registers 0 and 1 (BRGC00 and BRGC01) allows a baud rate selection of 600 bps to 115.2 kbps (@ fx = 8.38 MHz operation) or 1200 bps to 153.6 kbps (@ fx = 12 MHz operation) for UART00 and 300 bps to 38.4 kbps (@ fx = 8.38 MHz operation) or 600 bps to 76.8 kbps (@ fx = 12 MHz operation) for UART01.

# (3) Infrared data transfer mode (UART00 only)

This mode allows communication at a baud rate of 115.2 kbps (@ fx = 7.3728 MHz operation).

# 12.2 Configuration of Serial Interfaces

Serial interfaces UART00 and UART01 includes the following hardware.

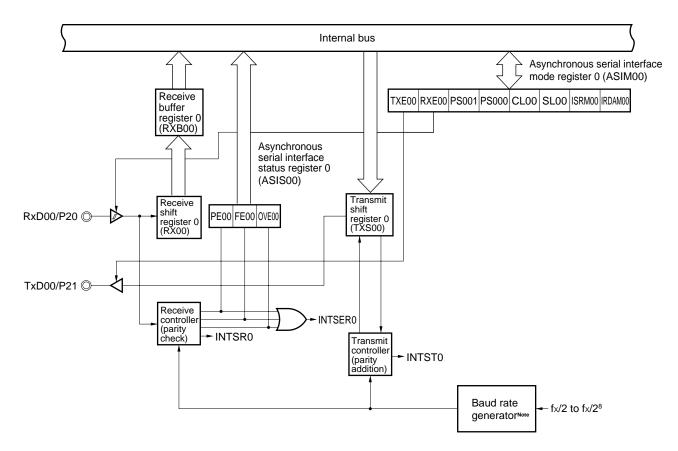

Table 12-1. Configuration of Serial Interfaces

| Item              | Configuration   |
|-------------------|---|
| Registers         | Transmit shift register n (TXS0n)   |
|                   | Receive shift register n (RX0n)   |
|                   | Receive buffer register n (RXB0n)   |
| Control registers | Asynchronous serial interface mode register n (ASIM0n) Asynchronous serial interface status register n (ASIS0n) |
|                   | Baud rate generator control register n (BRGC0n)   |
|                   | Port mode register 2 (PM2) <sup>Note</sup>  |

Note Refer to Figure 4-4 Block Diagram of P20 to P26.

Remark n = 0, 1

Remark TXE00: Bit 7 of asynchronous serial interface mode register 0 (ASIM00)

RXE00: Bit 6 of asynchronous serial interface mode register 0 (ASIM00)

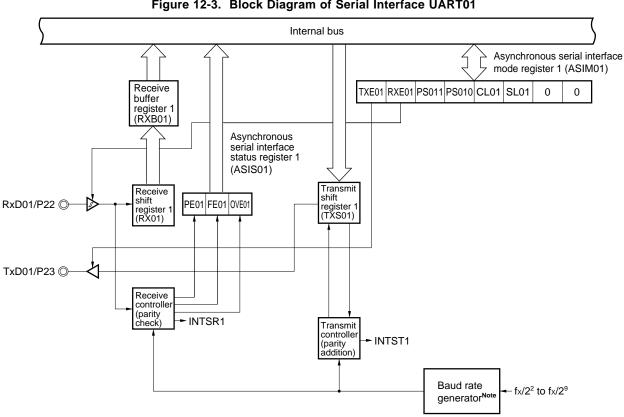

Figure 12-3. Block Diagram of Serial Interface UART01

Note Refer to **Figure 12-4** for the baud rate generator configuration.

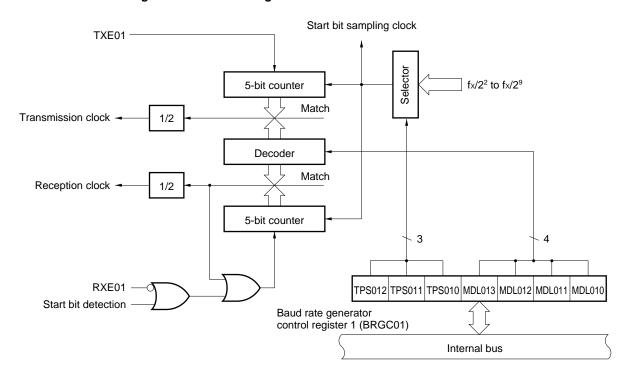

Figure 12-4. Block Diagram of UART01 Baud Rate Generator

Remark TXE01: Bit 7 of asynchronous serial interface mode register 1 (ASIM01) RXE01: Bit 6 of asynchronous serial interface mode register 1 (ASIM01)

#### (1) Transmit shift register n (TXS0n)

This register is used to set the transmit data. The data written in TXS0n is transmitted as serial data.

If the data length is specified as 7 bits, bits 0 to 6 of the data written in TXS0n are transferred as transmit data.

Writing data to TXS0n starts the transmit operation.

TXS0n is written to with an 8-bit memory manipulation instruction. It cannot be read.

RESET input sets TXS0n to FFH.

Caution TXS0n must not be written to during a transmit operation. TXS0n and receive buffer register n (RXB0n) are allocated to the same address, and when a read is performed, the value of RXB0n is read.

## (2) Receive shift register n (RX0n)

This register is used to convert serial data input to the RxD0n pin to parallel data. When one byte of data is received, the receive data is transferred to receive buffer register n (RXB0n).

RX0n cannot be directly manipulated by a program.

#### (3) Receive buffer register n (RXB0n)

This register holds receive data. Each time one byte of data is received, new receive data is transferred from receive shift register n (RX0n).

If the data length is specified as 7 bits, the receive data is transferred to bits 0 to 6 of RXB0n, and the MSB of RXB0n is always set to 0.

RXB0n is read with an 8-bit memory manipulation instruction. It cannot be written to.

RESET input sets RXB0n to FFH.

Caution RXB0n and transmit shift register n (TXS0n) are allocated to the same address, and when a write is performed, the value is written to TXS0n.

# (4) Transmission control circuit

This circuit performs transmit operation control such as the addition of a start bit, parity bit and stop bit to data written in transmit shift register n (TXS0n) in accordance with the contents set in asynchronous serial interface mode register n (ASIM0n).

## (5) Reception control circuit

This circuit controls receive operations in accordance with the contents set in asynchronous serial interface mode register n (ASIM0n). It performs error checks for parity errors, etc., during a receive operation, and if an error is detected, sets a value in asynchronous serial interface status register n (ASIS0n) in accordance with the error contents.

# 12.3 Registers Controlling Serial Interfaces

The following six registers control the serial interfaces UART00 and UART01.

- Asynchronous serial interface mode registers 0, 1 (ASIM00, ASIM01)
- Asynchronous serial interface status registers 0, 1 (ASIS00, ASIS01)
- Baud rate generator control registers 0, 1 (BRGC00, BRGC01)

# (1) Asynchronous serial interface mode registers 0, 1 (ASIM00, ASIM01)

ASIM00 and ASIM01 are 8-bit registers that control the serial transfer operation of the asynchronous serial interface

These registers are set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears these registers to 00H.

# Caution Set the port mode register (PM2x) in the UART mode, as shown below. Set each output latch to 0.

- For reception
  - Set P20 (RxD00) and P22 (RxD01) to input mode (PM20 = 1, PM22 = 1)
- For transmission
  - Set P21 (TxD00) and P23 (TxD01) to output mode (PM21 = 0, PM23 = 0)
- For transmission and reception
  - Set P20 and P22 to input mode and P21 and P23 to output mode.

Caution Before changing the operation mode, be sure to stop the serial transmission/reception.

# (2) Asynchronous serial interface status registers 0, 1 (ASIS00, ASIS01)

ASIS00 and ASIS01 are the registers that indicate the error contents when a receive error occurs. These registers can be read with an 8-bit memory manipulation instruction. RESET input clears these registers to 00H.

Figure 12-7. Format of Asynchronous Serial Interface Status Register 0

| Symbol | 7    | 6      | 5                   | 4        | 3                   | 2    | 1    | 0     | Address | After reset | R/W |

| 0    | Framing error does not occur.                                   |
| 1    | Framing error occurs <sup>Note 1</sup> (stop bit not detected). |

| OVE01 | Overrun error flag  |
|-------|---|
| 0     | Overrun error does not occur.   |
| 1     | Overrun error occurs <sup>Note 2</sup> (Next receive completed before data is read from receive buffer register). |

- **Notes 1.** Even if the stop bit length is set to 2 bits using bit 2 (SL01) of asynchronous serial interface mode register 1 (ASIM01), only 1 stop bit is detected during reception.
  - 2. If an overrun error occurs, be sure to read receive buffer register 1 (RXB01). Until RXB01 is read, an overrun error persistently occurs each time data is received.

# (3) Baud rate generator control registers 0, 1 (BRGC00, BRGC01)

BRGC00 and BRGC01 are the registers that set the serial clock of the asynchronous serial interface. These registers are set by an 8-bit memory manipulation instruction.

RESET input clears these registers to 00H.

Figure 12-9. Format of Baud Rate Generator Control Register 0

Note Expanded-specification products only.

- Cautions 1. If a write to BRGC00 is performed during communication, the output of the baud rate generator may be disrupted, preventing normal communication from continuing. BRGC00 should therefore not be written to during communication.
  - 2. Set BRGC00 to 00H in the infrared data transfer mode.
- Remarks 1. fx: System clock oscillation frequency
  - 2. fsck: 5-bit counter source clock
  - 3. k: Value set in bits MDL000 to MDL003 (0  $\leq$  k  $\leq$  14)

Note Expanded-specification products only.

Caution If a write to BRGC01 is performed during communication, the output of the baud rate generator may be disrupted, preventing normal communication from continuing. BRGC01 should therefore not be written to during communication.

Remarks 1. fx: System clock oscillation frequency

2. fsck: 5-bit counter source clock

**3.** k: Value set in bits MDL010 to MDL013 ( $0 \le k \le 14$ )

## 12.4 Operation of Serial Interfaces

The following three operating modes are available for the serial interfaces UART00 and UART01.

- · Operation stop mode
- · Asynchronous serial interface (UART) mode
- Infrared data transfer mode (UART00 only)

# 12.4.1 Operation stop mode

Serial transfer is not executed in this mode. Consequently, the power consumption can be reduced. In the operation stop mode, the pins can be used as ordinary port pins.

# (1) Register setting

The operation stop mode is set using asynchronous serial interface mode registers 0 and 1 (ASIM00 and ASIM01).

ASIM00 and ASIM01 are set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears these registers to 00H.

| Symbol | 7     | 6     | 5     | 4     | 3    | 2    | 1      | 0       | Address         | After reset | R/W |

|-------|-------|------------------------------------|--|--|
| 0     | 0     | Operation stopped                  | Port function                            | Port function                            |
| 0     | 1     | UART mode<br>(reception only)      | Serial function                          |  |
| 1     | 0     | UART mode (transmission only)      | Port function                            | Serial function                          |
| 1     | 1     | UART mode (transmission/reception) | Serial function                          |  |

Caution Before changing the operation mode, be sure to stop the serial transmission/reception.

Remark n = 0, 1

#### 12.4.2 Asynchronous serial interface (UART) mode

In this mode, one byte of data is transmitted/received following a start bit, and full-duplex operation is possible. A baud rate generator is incorporated, enabling communication to be performed at any of a wide range of baud ates.

Programming baud rate generator control registers 0 and 1 (BRGC00 and BRGC01) allows a baud rate selection

★ of 600 bps to 115.2 kbps (@ fx = 8.38 MHz operation) or 1200 bps to 153.6 kbps (@ fx = 12 MHz operation) for UART00 and 300 bps to 38.4 kbps (@ fx = 8.38 MHz operation) or 600 bps to 76.8 kbps (@ fx = 12 MHz operation) for UART01.

#### (1) Register setting

The UART mode is set using asynchronous serial interface mode registers 0 and 1 (ASIM00 and ASIM01), asynchronous serial interface status registers 0 and 1 (ASIS00 and ASIS01), and baud rate generator control registers 0 and 1 (BRGC00 and BRGC01).

## (a) Asynchronous serial interface mode registers 0, 1 (ASIM00, ASIM01)

ASIM00 and ASIM01 are set by a 1-bit or 8-bit memory manipulation instruction. RESET input clears these registers to 00H.

Caution Set the port mode register (PM2x) in the UART mode, as shown below. Set each output latch to 0.

• For reception

Set P20 (RxD00) and P22 (RxD01) to input mode (PM20 = 1, PM22 = 1)

• For transmission

Set P21 (TxD00) and P23 (TxD01) to output mode (PM21 = 0, PM23 = 0)

• For transmission and reception

Set P20 and P22 to input mode and P21 and P23 to output mode.

| PE0n | Parity error flag  |
|------|--|
| 0    | Parity error does not occur.   |
| 1    | Parity error occurs (transmit data parity specification and receive data parity do not match). |

| FE | 0n | Framing error flag  |
|----|----|---|
| 0  |    | Framing error does not occur.                                   |
| 1  |    | Framing error occurs <sup>Note 1</sup> (stop bit not detected). |

| OVE0n | Overrun error flag  |
|-------|---|
| 0     | Overrun error does not occur.   |
| 1     | Overrun error occurs <sup>Note 2</sup> (Next receive completed before data is read from receive buffer register). |

- **Notes 1.** Even if the stop bit length is set to 2 bits using bit 2 (SL0n) of asynchronous serial interface mode register n (ASIM0n), only 1 stop bit is detected during reception.
  - 2. If an overrun error occurs, be sure to read receive buffer register n (RXB0n). Until RXB0n is read, an overrun error persistently occurs each time data is received.

## **★** (c) Baud rate generator control registers 0, 1 (BRGC00, BRGC01)

BRGC00 and BRGC01 are set by an 8-bit memory manipulation instruction. RESET input clears these registers to 00H.

Note Expanded-specification products only.

- Cautions 1. If a write to BRGC00 is performed during communication, the output of the baud rate generator may be disrupted, preventing normal communication from continuing. BRGC00 should therefore not be written to during communication.
  - 2. Set BRGC00 to 00H in the infrared data transfer mode.
- Remarks 1. fx: System clock oscillation frequency
  - 2. fsck: 5-bit counter source clock
  - **3.** k: Value set in bits MDL000 to MDL003 ( $0 \le k \le 14$ )

| 1      | 1      | 1      | 1      | Setting prohibited                        | _  |

Note Expanded-specification products only.

Caution If a write to BRGC01 is performed during communication, the output of the baud rate generator may be disrupted, preventing normal communication from continuing. BRGC01 should therefore not be written to during communication.

Remarks 1. fx: System clock oscillation frequency

2. fsck: 5-bit counter source clock

3. k: Value set in bits MDL010 to MDL013 ( $0 \le k \le 14$ )

The transmit/receive clock for the baud rate to be generated is obtained by dividing the system clock.

## . Generating transmit/receive clock for baud rate from system clock

The transmit/receive clock is generated by dividing the system clock. The baud rate generated from the system clock can be calculated from the following expression.

[Baud rate] = 
$$\frac{fx}{2^{m+1}(k+16)}$$
 [Hz]

fx: System clock oscillation frequency

m: Value set by TPS0n0 to TPS0n2 (n = 0, 1)  $(1 \le m \le 8 \text{ for UART00}, \ 2 \le m \le 9 \text{ for UART01})$ 

k: Value set by MDL0n0 to MDL0n3 (n = 0, 1) (0  $\leq$  k  $\leq$  14)

Tables 12-2 and 12-3 show the relationship between the source clock of the 5-bit counter and the value of m. Table 12-4 shows the relationship between the system clock and baud rate.

## ★ Table 12-2. Relationship Between Source Clock of 5-Bit Counter and Value of m (with UART00)

| TPS002 | TPS001 | TPS000 |                   | 5-Bit Counter Source           | Clock Selection  | m |

**Note** Expanded-specification products only.

## · Range of baud rate tolerance

The range of baud rate tolerance depends on the number of bits in one frame and division ratio of the counter [1/(16 + k)].

Figure 12-11 shows an example of baud rate tolerance.

Figure 12-11. Baud Rate Tolerance Including Sampling Error (When k = 0)

Remark T: Source clock cycle of 5-bit counter

Baud rate tolerance (when k = 0) =  $\pm 15.5/320 \times 100 = 4.8438$  (%)

# (2) Communication operation

# (a) Data format

Figure 12-12 shows transmit/receive data format.

Figure 12-12. Asynchronous Serial Interface Transmit/Receive Data Format

One data frame consists of following bits:

- Start bits ...... 1 bit
- Character bits ....... 7 bits/8 bits
- Parity bits ...... Even parity/odd parity/0 parity/no parity
- Stop bits ...... 1 bit/2 bits

The character bit length, parity bit and stop bit length for each data frame is specified by asynchronous serial interface mode register n (ASIM0n).

When 7 bits are selected as the number of character bits, only the lower 7 bits (bits 0 to 6) are valid; in transmission the most significant bit (bit 7) is ignored, and in reception the most significant bit (bit 7) is always 0.

The serial transfer rate is selected by means of baud rate generator control register n (BRGC0n). If a serial data receive error is generated, the receive error contents can be determined by reading the status of asynchronous serial interface status register n (ASIS0n).

#### (b) Parity types and operation

The parity bit is used to detect a bit error in the communication data. Normally, the same kind of parity bit is used on the transmitting side and the receiving side. With even parity and odd parity, a one-bit (odd number) error can be detected. With 0 parity and no parity, an error cannot be detected.

## (i) Even parity

#### Transmission

The number of bits with a value of "1", including the parity bit, in the transmit data is controlled to be even. The value of the parity bit is as follows:

Number of bits with a value of "1" in transmit data is odd: 1 Number of bits with a value of "1" in transmit data is even: 0

#### Reception

The number of bits with a value of "1", including the parity bit, in the receive data is counted. If it is odd, a parity error occurs.

## (ii) Odd parity

#### Transmission

Conversely to the situation with even parity, the number of bits with a value of "1", including the parity bit, in the transmit data is controlled to be odd. The value of the parity bit is as follows:

Number of bits with a value of "1" in transmit data is odd: 0 Number of bits with a value of "1" in transmit data is even: 1

# • Reception

The number of bits with a value of "1", including the parity bit, in the receive data is counted. If it is even, a parity error occurs.

## (iii) 0 Parity

When transmitting, the parity bit is set to 0 irrespective of the transmit data.

At reception, a parity bit check is not performed. Therefore, a parity error is not generated, irrespective of whether the parity bit is set to 0 or 1.

## (iv) No parity

A parity bit is not added to the transmit data. At reception, data is received assuming that there is no parity bit. Since there is no parity bit, a parity error is not generated.

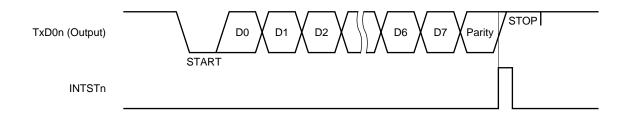

#### (c) Transmission

A transmit operation is enabled by setting the TXE0n bit of asynchronous serial interface mode n (ASIM0n) to 1 and is started by writing transmit data to transmit shift register n (TXS0n). The start bit, parity bit and stop bit(s) are added automatically.

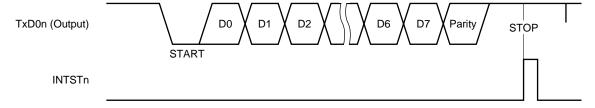

When transmit operation starts, the data in transmit shift register n (TXS0n) is shifted out, and when transmit shift register n (TXS0n) is empty, a transmission completion interrupt request (INTSTn) is generated.

Figure 12-13. Timing of Asynchronous Serial Interface Transmission Completion Interrupt Request Generation

## (a) Stop bit length: 1

# (b) Stop bit length: 2

Caution

Rewriting of asynchronous serial interface mode register n (ASIM0n) should not be performed during a transmit operation. If rewriting of the ASIM0n register is performed during transmission, subsequent transmit operations may not be possible (the normal state is restored by RESET input).

It is possible to determine whether transmission is in progress by software by using a transmission completion interrupt request (INTSTn) or the interrupt request flag (STIFn) set by INTSTn.

#### (d) Reception

When the RXE0n bit of asynchronous serial interface mode register n (ASIM0n) is set (1), a receive operation is enabled and sampling of the RxD0n pin input is performed.

RxD0n pin input sampling is performed using the serial clock specified by ASIM0n.

When the RxD0n pin input becomes low, the 5-bit counter of the baud rate generator starts counting, and at the time when half the time determined by the specified baud rate has passed, the data sampling start timing signal is output. If the RxD0n pin input sampled again as a result of this start timing signal is low, it is identified as a start bit, the 5-bit counter is initialized and starts counting, and data sampling is performed. When character data, a parity bit and one stop bit are detected after the start bit, reception of one frame of data ends.

When one frame of data has been received, the receive data in the shift register is transferred to receive buffer register n (RXB0n), and a reception completion interrupt request (INTSRn) is generated.

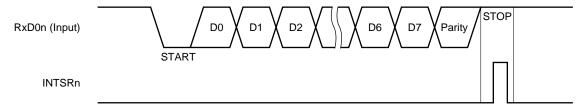

If an error occurs, the receive data in which the error occurred is still transferred to RXB0n.

INTSRn is generated if bit 1 (ISRM0n) of ASIM0n is cleared (0) on occurrence of the error.

If the ISRM0n bit is set (1), INTSRn is not generated.

If the RXE0n bit is reset (0) during the receive operation, the receive operation is stopped immediately. In this case, the contents of RXB0n and ASIS0n are not changed, and INTSRn and INTSRn are not generated.

Figure 12-14. Timing of Asynchronous Serial Interface Reception Completion Interrupt Request Generation

Caution Receive buffer register n (RXB0n) must be read even if a receive error occurs. If RXB0n is not read, an overrun error will occur when the next data is received, and the receive error state will continue indefinitely.

#### (e) Receive errors

The three types of errors during receive operations are the parity error, framing error and overrun error. With the UART00, setting the data receive result error flag in asynchronous serial interface status register 0 (ASIS00) generates a receive error interrupt request (INTSER0). The receiver error interrupt request is generated before the receive complete interrupt request (INTSR0). With the UART01, the receiver error interrupt request is not generated. Table 12-5 shows the causes of receive errors.

Reading the data in ASIS0n makes it possible to ascertain what error has occurred during reception (see Figures 12-14 and 12-15).

The contents of ASIS0n are reset (0) by reading receive buffer register n (RXB0n) or receiving the next data (if there is an error in the next data, the corresponding error flag is set).

 Receive Error
 Cause
 ASISOn Value

 Parity error
 Transmission-time parity specification and reception data parity do not match
 04H

 Framing error
 Stop bit not detected
 02H

 Overrun error
 Reception of next data is completed before data is read from receive buffer register
 01H

Table 12-5. Receive Error Causes

- Notes 1. INTSRn is not generated if a receive error occurs when the ISRM0n bit is set (1).
  - 2. The receive error interrupt request is not generated with UART01.
- Cautions 1. The contents of ASIS0n are reset (to 0) by reading receive buffer register n (RXB0n) or receiving the next data. To ascertain the error contents, ASIS0n must be read before reading RXB0n.
  - 2. Receive buffer register n (RXB0n) must be read even if a receive error has occurred. If RXB0n is not read, an overrun error will occur when the next data is received, and the receive error state will continue indefinitely.

#### 12.4.3 Infrared data transfer mode

## Caution The infrared data transfer mode can only be used with UART00.

In the infrared data transfer mode, pulses can be output and received in the following data format.

\* Remark The SIR standard is not supported (negotiation at 9,600 bps cannot be performed).

# (1) Data format

Figure 12-16 shows the data format of the infrared data transfer mode in comparison with the data format in LIART mode.

The IR frame corresponds to the bit string of the UART frame that consists of a start bit, 8 data bits and 1 stop bit.

The length of the electrical pulse transmitted or received in the IR frame is 3/16 of a 1-bit cycle. The pulse 3/16 of a 1-bit cycle rises in the middle of the bit cycle (refer to the figure below).

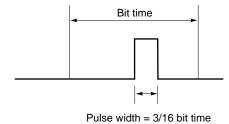

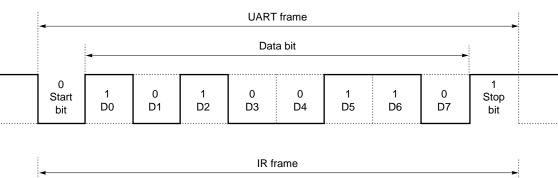

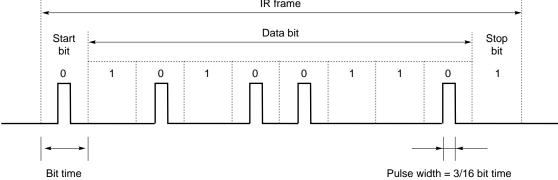

Figure 12-16. Comparison of Data Format in Infrared Data Transfer Mode and UART Mode

## (2) Bit rate and pulse width

Table 12-6 shows the values of the bit rate, bit rate tolerance, and pulse width.

Table 12-6. Bit Rate and Pulse Width

| Bit Rate<br>(kbits/s)   | Bit Rate Tolerance<br>(% of Bit Rate) | Minimum Pulse Width (μs) <sup>Note 2</sup> | Nominal Value of Pulse<br>Width 3/16 (μs) | Maximum Pulse<br>Width (μs) |
|-------------------------|---------------------------------------|--|---|-----------------------------|
| 115.2 <sup>Note 1</sup> | ±0.87                                 | 1.41                                       | 1.63                                      | 2.71                        |

**Notes 1.** fx = @ 7.3728 MHz operation

2. Where a digital noise eliminator is used with the microcontroller at a frequency of 1.41 MHz or higher

Caution Set baud rate generator control register 0 (BRGC00) to 00H in the infrared data transfer mode.

Remark fx: System clock oscillation frequency

# (3) Baud rate that can be set in infrared data transfer mode

Table 12-7. Baud Rate That Can Be Set in Infrared Data Transfer Mode

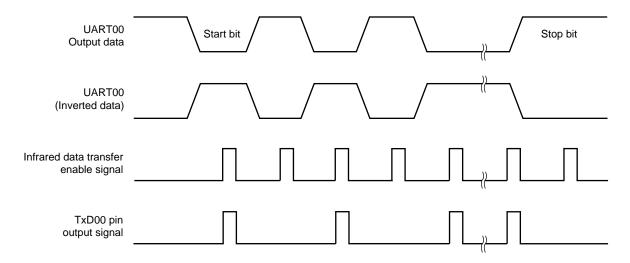

| System Clock fx (MHz)  | Baud Rate (bps)         |  |  |  |  |
|------------------------|-------------------------|--|--|--|--|
| 12.000 <sup>Note</sup> | 187,500 <sup>Note</sup> |  |  |  |  |

| 4.1943                 | 65,536                  |  |  |  |  |

Note Expanded-specification products only.

\*

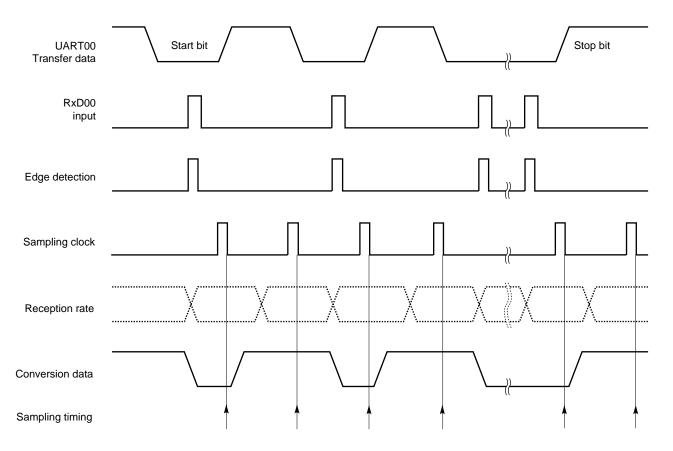

# (4) I/O data and internal signal

# • Transmission timing

# • Reception timing

Data reception is delayed by half the set baud rate.

## **CHAPTER 13 SERIAL INTERFACE SIO3**

#### 13.1 Function of Serial Interface SIO3

Serial interface SIO3 has the following two modes.

# (1) Operation stop mode

This mode is used when serial transfers are not performed. For details, see 13.4.1 Operation stop mode.

# (2) 3-wire serial I/O mode (fixed as MSB first)

This is an 8-bit data transfer mode using three lines: a serial clock line (SCK), serial output line (SO), and serial input line (SI).

Since simultaneous transmit and receive operations are enabled in 3-wire serial I/O mode, the processing time for data transfers is reduced.

The first bit of the serial transferred 8-bit data is fixed as the MSB.

3-wire serial I/O mode is useful for connection to a peripheral I/O incorporating a clock-synchronous serial interface, a display controller, etc.

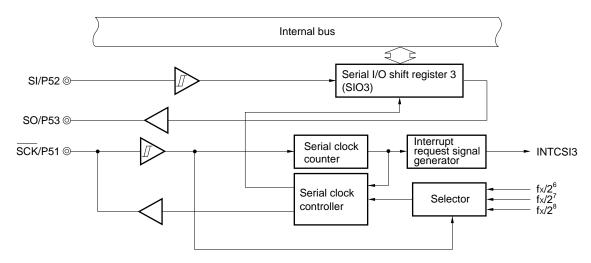

# 13.2 Configuration of Serial Interface

Serial interface SIO3 includes the following hardware.

Table 13-1. Configuration of Serial Interface 3

| Item             | Configuration                            |  |  |  |  |
|------------------|--|--|--|--|--|
| Register         | Serial I/O shift register 3 (SIO3)       |  |  |  |  |
| Control register | Serial operation mode register 3 (CSIM3) |  |  |  |  |

Figure 13-1. Block Diagram of Serial Interface 3

# (1) Serial I/O shift register 3 (SIO3)

This is an 8-bit register that performs parallel-serial conversion and serial transmit/receive (shift operations) in synchronization with the serial clock.

SIO3 is set by an 8-bit memory manipulation instruction.

When bit 7 (CSIE3) of serial operation mode register 3 (CSIM3) is set to 1, a serial operation can be started by writing data to or reading data from SIO3.

When transmitting, data written to SIO3 is output to the serial output (SO).

When receiving, data is read from the serial input (SI) and written to SIO3.

RESET input makes SIO3 undefined.

Caution Do not access SIO3 during a transfer operation unless the access is triggered by a transfer start (read operations are disabled when MODE = 0 and write operations are disabled when MODE = 1).

#### 13.3 Register Controlling Serial Interface

Serial interface SIO3 is controlled by the following register.

• Serial operation mode register 3 (CSIM3)

#### (1) Serial operation mode register 3 (CSIM3)

This register is used to enable or disable the SIO3 serial clock, operation modes, and specific operations. CSIM3 can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets CSIM3 to 00H.

Caution When using the 3-wire serial I/O mode, set the port mode registers (PM5x) as shown below.

Also, set the respective output latches to 0.

- For serial clock output (master transmit/receive)
   Set P51 (SCK) to the output mode (PM51 = 0).
- For serial clock input (slave transmit/receive)
   Set P51 to the input mode (PM51 = 1).
- For transmit/transmit and receive mode
   Set P53 (SO) to the output mode (PM53 = 0).
   Set P52 (SI) to the input mode (PM52 = 1) (in transmit/receive mode).
- For receive mode

  Set P52 (SI) to the input mode (PM52 = 1).

Figure 13-2. Format of Serial Operation Mode Register 3

| Symbol | 7     | 6 | 5 | 4 | 3 | 2    | 1     | 0     | Address | After reset | R/W |

|-------|-------|-------------------------------------|----------------------------------|------------------|--|--|--|--|
|       |       |                                     | At fx = 12 MHz <sup>Note 3</sup> | At fx = 8.38 MHz |  |  |  |  |
| 0     | 0     | External clock i                    | External clock input to SCK pin  |                  |  |  |  |  |
| 0     | 1     | fx/2 <sup>6</sup>                   | 187 kHz                          | 131 kHz          |  |  |  |  |
| 1     | 0     | fx/2 <sup>7</sup>                   | 93.7 kHz                         | 65.5 kHz         |  |  |  |  |
| 1     | 1     | fx/2 <sup>8</sup> 46.8 kHz 32.7 kHz |                                  |                  |  |  |  |  |

**Notes 1.** When CSIE3 = 0 (SIO3 operation stopped), the SI, SO, and  $\overline{SCK}$  pins can be used for port functions.

- 2. When CSIE3 = 1 (SIO3 operation enabled), if only the transmit function is used, the SI pin can be used for a port function, and in the receive-only mode, the SO pin can be used for a port function.
- **3.** Expanded-specification products only

Remark fx: System clock oscillation frequency

## 13.4 Operation of Serial Interface

This section explains the two modes of serial interface SIO3.

#### 13.4.1 Operation stop mode

Because serial transfer is not performed during this mode, the power consumption can be reduced. In addition, pins can be used as normal I/O ports.

# (1) Register settings

Operation stop mode is set by serial operation mode register 3 (CSIM3). CSIM3 can be set by a 1-bit or 8-bit memory manipulation instruction. RESET input sets CSIM3 to 00H.

| Symbol | 7     | 6 | 5 | 4 | 3 | 2    | 1     | 0     | Address | After reset | R/W |
|--------|-------|---|---|---|---|------|-------|-------|---------|-------------|-----|
| CSIM3  | CSIE3 | 0 | 0 | 0 | 0 | MODE | SCL31 | SCL30 | FFB0H   | 00H         | R/W |

| CSIE3 | Enable/disable specification for SIO3 |                         |  |  |  |  |  |  |  |
|-------|---------------------------------------|-------------------------|--|--|--|--|--|--|--|
|       | Shift register operation              | Serial counter          | Port                                   |  |  |  |  |  |  |
| 0     | Operation disabled                    | Cleared                 | Port function <sup>Note 1</sup>        |  |  |  |  |  |  |
| 1     | Operation enabled                     | Count operation enabled | Serial function + port function Note 2 |  |  |  |  |  |  |

**Notes 1.** When CSIE3 = 0 (SIO3 operation stopped), the SI, SO, and  $\overline{SCK}$  pins can be used for port functions.

2. When CSIE3 = 1 (SIO3 operation enabled), if only the transmit function is used, the SI pin can be used for a port function, and in the receive-only mode, the SO pin can be used for a port function.

#### 13.4.2 3-wire serial I/O mode

The 3-wire serial I/O mode is useful for connection to a peripheral I/O incorporating a clock-synchronous serial interface, a display controller, etc.

This mode executes data transfers via three lines: a serial clock line (SCK), serial output line (SO), and serial input line (SI).

#### (1) Register settings

The 3-wire serial I/O mode is set by serial operation mode register 3 (CSIM3).

CSIM3 can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets CSIM3 to 00H.

# Caution When using the 3-wire serial I/O mode, set the port mode registers (PM5x) as shown below.

Also, set the respective output latches to 0.

- For serial clock output (master transmit/receive)
  - Set P51 ( $\overline{SCK}$ ) to the output mode (PM51 = 0).
- For serial clock input (slave transmit/receive)
  - Set P51 to the input mode (PM51 = 1).
- · For transmit/transmit and receive mode
  - Set P53 (SO) to the output mode (PM53 = 0).
  - Set P52 (SI) to the input mode (PM52 = 1) (in transmit/receive mode).
- · For receive mode
  - Set P52 (SI) to the input mode (PM52 = 1).

| Symbol | 7     | 6 | 5 | 4 | 3 | 2    | 1     | 0     | Address | After reset | R/W |

|-------|-------|-------------------|---|----------|--|--|--|--|
|       |       |                   | At $f_X = 12 \text{ MHz}^{\text{Note 3}}$ At $f_X = 8.38 \text{ MHz}^{\text{Note 3}}$ |          |  |  |  |  |
| 0     | 0     | External clock i  | External clock input to SCK pin   |          |  |  |  |  |
| 0     | 1     | fx/2 <sup>6</sup> | 187 kHz   | 131 kHz  |  |  |  |  |
| 1     | 0     | fx/2 <sup>7</sup> | 93.7 kHz  | 65.5 kHz |  |  |  |  |
| 1     | 1     | fx/2 <sup>8</sup> | fx/2 <sup>8</sup> 46.8 kHz 32.7 kHz   |          |  |  |  |  |

**Notes 1.** When CSIE3 = 0 (SIO3 operation stopped), the SI, SO, and  $\overline{\text{SCK}}$  pins can be used for port functions.

- 2. When CSIE3 = 1 (SIO3 operation enabled), if only the transmit function is used, the SI pin can be used for a port function, and in the receive-only mode, the SO pin can be used for a port function.
- 3. Expanded-specification products only

Remark fx: System clock oscillation frequency

#### (2) Communication operations

In the 3-wire serial I/O mode, data is transmitted and received in 8-bit units. Each bit of data is transmitted or received in synchronization with the serial clock.

Serial I/O shift register 3 (SIO3) is shifted in synchronization with the falling edge of the serial clock. Transmission data is held in the SO latch and is output from the SO pin. Data that is received via the SI pin in synchronization with the rising edge of the serial clock is latched to SIO3.

Completion of an 8-bit transfer automatically stops operation of SIO3 and sets an interrupt request flag (CSIIF3).

Figure 13-3. Timing of 3-Wire Serial I/O Mode

Transfer starts in synchronization with the SCK falling edge

#### (3) Transfer start

A serial transfer starts when the following conditions have been satisfied and transfer data has been set (or read) to serial I/O shift register 3 (SIO3).

- The SIO3 operation control bit (CSIE3) = 1
- After an 8-bit serial transfer, either the internal serial clock is stopped or SCK is set to high level.
- Transmit/transmit and receive mode
   When CSIE3 = 1 and MODE = 0, transfer starts when writing to SIO3.
- · Receive-only mode

When CSIE3 = 1 and MODE = 1, transfer starts when reading from SIO3.

Caution After data has been written to SIO3, transfer will not start even if the CSIE3 bit value is set to 1.

Completion of an 8-bit transfer automatically stops the serial transfer operation and sets an interrupt request flag (CSIIF3).

#### **CHAPTER 14 INTERRUPT FUNCTIONS**

#### 14.1 Types of Interrupt Functions

The following three types of interrupt functions are available.

# (1) Non-maskable interrupt

This interrupt is unconditionally acknowledged even in the interrupt disabled status. It is not subject to interrupt priority control and therefore takes precedence over all interrupt requests.

This interrupt generates a standby release signal.

One interrupt request from the watchdog timer is incorporated as a non-maskable interrupt.

## (2) Maskable interrupts

These interrupts are subject to mask control, and can be divided into two groups according to the setting of the priority specification flag register (PR0L, PR0H, PR1L): one with higher priority and the other with lower priority. Higher-priority interrupts can nest lower-priority interrupts. The priority when two or more interrupt requests with the same priority occur at the same time is predetermined (refer to **Table 14-1**).

This interrupt generates a standby release signal.

Eight external interrupt requests and sixteen internal interrupt requests are incorporated as maskable interrupts.

#### (3) Software interrupt

This is a vectored interrupt generated when the BRK instruction is executed and can be acknowledged even in the interrupt disabled status. This interrupt is not subject to interrupt priority control.

## 14.2 Interrupt Sources and Configuration

A total of 26 interrupt sources including non-maskable, maskable, and software interrupt sources are available (refer to **Table 14-1**).

**Remark** There are two types of interrupt sources for the watchdog timer (INTWDT): non-maskable interrupts and maskable interrupts (internal). Only one of these interrupts can be selected.

Table 14-1. Interrupt Source List (1/2)

| Interrupt        | Note 1<br>Default |          | Interrupt Source  | Internal/ | Vector<br>Table | Note 2<br>Basic       |

# 14.3 Registers Controlling Interrupt Functions

The following eight types of registers control the interrupt functions.

- Interrupt request flag registers (IF0L, IF0H, IF1L)
- Interrupt mask flag registers (MK0L, MK0H, MK1L)
- Priority specification flag registers (PR0L, PR0H, PR1L)
- External interrupt rising edge enable register (EGP)
- External interrupt falling edge enable register (EGN)
- External interrupt rising edge enable register 5 (EGP5)
- External interrupt falling edge enable register 5 (EGN5)
- Program status word (PSW)

Table 14-2 shows the names of the interrupt request flags, interrupt mask flags, and priority specification flags corresponding to the respective interrupt request sources.

Table 14-2. Flags Corresponding to Respective Interrupt Request Sources

| Interrupt Source | Interrupt Re          | equest Flag | Interrupt Mask Flag   |          | Priority Spec         | ification Flag |

Note Interrupt control flag when the watchdog timer is used as an interval timer

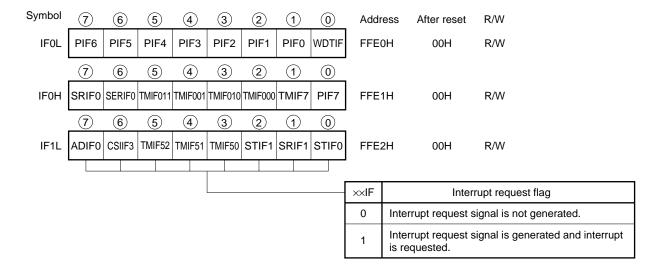

# (1) Interrupt request flag registers (IF0L, IF0H, IF1L)

An interrupt request flag is set to 1 when the corresponding interrupt request is generated or when an instruction is executed, and is cleared to 0 when the interrupt request is acknowledged, when the RESET signal is input, or when an instruction is executed.

IF0L, IF0H, and IF1L are set by a 1-bit or 8-bit memory manipulation instruction. When using IF0L and IF0H as a 16-bit register, IF0, it is set by a 16-bit memory manipulation instruction.

RESET input clears these registers to 00H.

Figure 14-2. Format of Interrupt Request Flag Registers

- Cautions 1. The WDTIF flag can be read/written only when the watchdog timer is used as an interval timer. Clear the WDTIF flag to 0 when watchdog timer mode 1 is used.
  - Before restarting the timer, serial interface, or A/D converter in the standby mode, be sure to clear the interrupt request flag. Note that noise may cause an interrupt request flag to be set.
  - 3. When an interrupt is acknowledged, the interrupt request flag is automatically cleared, and then the interrupt routine is started.

## (2) Interrupt mask flag registers (MK0L, MK0H, MK1L)

An interrupt mask flag enables or disables the corresponding maskable interrupt servicing and release of the standby mode.

MK0L, MK0H, and MK1L are set by a 1-bit or 8-bit memory manipulation instruction. When using MK0L and MK0H as a 16-bit register, MK0, it is set by a 16-bit memory manipulation instruction.

RESET input sets these registers to FFH.

Symbol (6) (5) (4) (3) (2) (1) (0) Address R/W After reset PMK6 PMK5 PMK4 PMK3 PMK2 PMK1 PMK0 WDTMK MK0L FFE4H FFH R/W (7)(4) (2) (1) (6) (5) (3) (0) TMMK TMMK TMMK TMMK MKOH SRMKO SERMKO TMMK7 PMK7 FFE5H FFH R/W 001 010 000 011 (7)(5) (3) (2) (1) (0) (6) (4) TMMK TMMK TMMK MK1L ADMK0 CSIMK3 STMK1 SRMK1 STMK0 FFE6H FFH R/W  $\times \times MK$ Interrupt servicing control 0 Enables interrupt servicing

Figure 14-3. Format of Interrupt Mask Flag Register

- Cautions 1. If the watchdog timer is used in watchdog timer mode 1, the WDTMK flag will be undefined when read.
  - 2. Because port 0 and P54 to P57 have alternate functions of external interrupt request inputs, the corresponding interrupt request flag is set when the output mode is specified and output level of a port pin is changed.

To use the port in the output mode, therefore, set the corresponding interrupt mask flag to 1 in advance.

Disables interrupt servicing

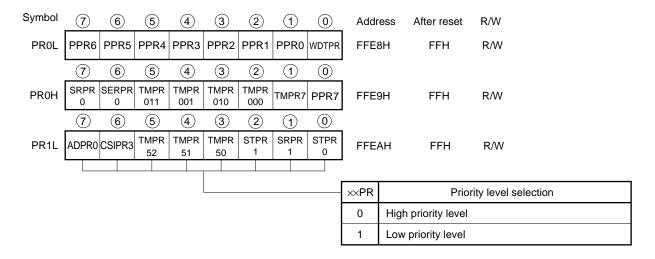

## (3) Priority specification flag registers (PR0L, PR0H, PR1L)

A priority specification flag sets the priority of the corresponding maskable interrupt.

PR0L, PR0H, and PR1L are set by a 1-bit or 8-bit memory manipulation instruction. When using PR0L and PR0H as a 16-bit register, PR0, it is set by a 16-bit memory manipulation instruction.

RESET input sets these registers to FFH.

Figure 14-4. Format of Priority Specification Flag Register

Caution To use the watchdog timer in watchdog timer mode 1, set the WDTPR flag to 1.

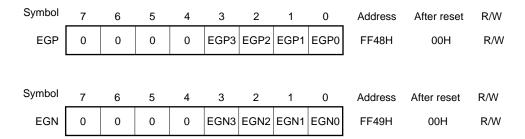

# (4) External interrupt rising edge enable register (EGP), external interrupt falling edge enable register (EGN)

EGP and EGN specify the valid edge to be detected on pins P00 to P03.

EGP and EGN can be read or written to with a 1-bit or 8-bit memory manipulation instruction.

RESET input clears these registers to 00H.

Figure 14-5. Format of External Interrupt Rising Edge Enable Register and External Interrupt Falling Edge Enable Register

| EGPn | EGNn | Valid edge of INTPn pin (n = 0 to 3) |

| 1    | 1    | Both rising and falling edges        |

# (5) External interrupt rising edge enable register 5 (EGP5), external interrupt falling edge enable register 5 (EGN5)

EGP5 and EGN5 specify the valid edge to be detected on pins P54 to P57.

EGP5 and EGN5 can be read or written to with a 1-bit or 8-bit memory manipulation instruction.

RESET input clears these registers to 00H.

| 1     | 1     | Both rising and falling edges        |

#### (6) Program status word (PSW)

The program status word is a register that holds the instruction execution result and current status of interrupt request. An IE flag that enables/disables the maskable interrupts and an ISP flag that controls multiple interrupts processing are mapped to this register.

This register can be read or written in 8-bit units. In addition, it can also be manipulated by using a bit manipulation instruction or dedicated instructions (EI and DI). When a vectored interrupt request is acknowledged, and when the BRK instruction is executed, the contents of the PSW are automatically saved to the stack. At this time, the IE flag is reset to 0. If a maskable interrupt request has been acknowledged, the contents of the priority flag of that interrupt are transferred to the ISP flag. The contents of the PSW can also be saved to the stack by the PUSH PSW instruction, and restored from the stack by RETI, RETB, or POP PSW instruction.

RESET input sets the PSW to 02H.

Figure 14-7. Configuration of Program Status Word

#### 14.4 Interrupt Servicing Operation

#### 14.4.1 Non-maskable interrupt request acknowledgement operation

The non-maskable interrupt request is unconditionally acknowledged even when interrupt requests are disabled. It is not subject to interrupt priority control and takes precedence over all other interrupts.

When the non-maskable interrupt request is acknowledged, the contents are saved to the stack, program status word (PSW) and program counter (PC), in that order, the IE flag and ISP flag are reset to 0, the contents of the vector table are loaded to the PC, and then program execution branches.

If a new non-maskable interrupt request is generated while the non-maskable interrupt service program is being executed, the interrupt request is acknowledged when the current execution of the non-maskable interrupt service program is complete (after the RETI instruction has been executed) and one instruction in the main routine has been executed. If two or more new non-maskable interrupt requests are generated while the non-maskable interrupt service program is being executed, only one non-maskable interrupt request is acknowledged after execution of the non-maskable interrupt service program is complete.

Figure 14-8 shows the flowchart from non-maskable interrupt request generation to acknowledgement, Figure 14-9 shows the timing of non-maskable interrupt request acknowledgement, and Figure 14-10 shows the acknowledgement operation when multiple non-maskable interrupt requests are generated.

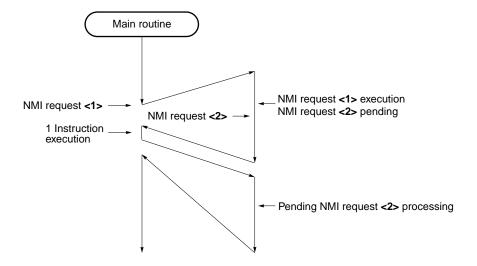

Figure 14-9. Timing of Non-Maskable Interrupt Request Acknowledgement

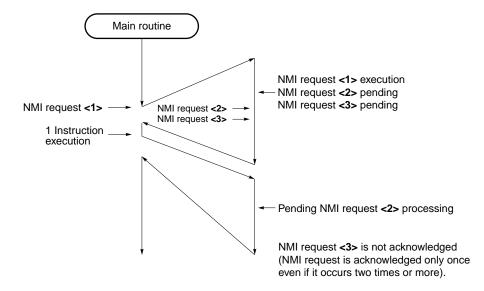

WDTIF: Watchdog timer interrupt request flag

Figure 14-10. Acknowledgement Operation of Non-Maskable Interrupt Request

(a) When new non-maskable interrupt request is generated while non-maskable interrupt service program is being executed

(b) If two new non-maskable interrupt requests are generated while non-maskable interrupt service program is being executed

#### 14.4.2 Maskable interrupt request acknowledgement operation

A maskable interrupt request can be acknowledged when the interrupt request flag is set to 1 and the corresponding interrupt request mask (MK) flag is cleared to 0. A vectored interrupt request is acknowledged in the interrupt enabled status (when the IE flag is set to 1). However, an interrupt request with a lower priority cannot be acknowledged while an interrupt with a higher priority is being serviced (when the ISP flag is reset to 0).

The time required to start the interrupt servicing after a maskable interrupt request has been generated is shown in Table 14-3.

For the timing of the interrupt request acknowledgement, refer to Figures 14-12 and 14-13.

Table 14-3. Time from Generation of Maskable Interrupt Request to Servicing

|               | Minimum Time | Maximum Time <sup>Note</sup> |
|---------------|--------------|------------------------------|
| When ××PR = 0 | 7 clocks     | 32 clocks                    |
| When ××PR = 1 | 8 clocks     | 33 clocks                    |

**Note** The wait time is the maximum when an interrupt request is generated immediately before a division instruction.

**Remark** 1 clock: 
$$\frac{1}{f_{CPU}}$$
 (fcpu: CPU clock)

When two or more maskable interrupt requests are generated at the same time, they are acknowledged starting from the one assigned the highest priority by the priority specification flag. If the same priorities are specified by the priority specification flag, the interrupt with the highest default priority is acknowledged first.

A pending interrupt request is acknowledged when the status in which it can be acknowledged is set.

Figure 14-11 shows the algorithm of acknowledging interrupt requests.

When a maskable interrupt request is acknowledged, the contents are saved to the stack, the program status word (PSW) and the program counter (PC), in that order, the IE flag is reset to 0, and the contents of the interrupt priority specification flag of the acknowledged interrupt request are transferred to the ISP flag. In addition, the data in the vector table determined for each interrupt request is loaded to the PC, and execution branches.

To return from interrupt servicing, use the RETI instruction.

Figure 14-13. Interrupt Request Acknowledgement Timing (Maximum Time)

**Remark** 1 clock:  $\frac{1}{f_{CPU}}$  (fcpu: CPU clock)

## 14.4.3 Software interrupt request acknowledgement operation

The software interrupt request can be acknowledged when the BRK instruction is executed. This interrupt cannot be disabled.

When the software interrupt request is acknowledged, the contents are saved to the stack, the program status word (PSW) and the program counter (PC), in that order, the IE flag is reset to 0, the contents of the vector table (003EH and 003FH) are loaded to the PC, and execution branches.

To return from the software interrupt servicing, use the RETB instruction.

Caution Do not use the RETI instruction to return from the software interrupt.

#### 14.4.4 Multiple interrupt servicing

Acknowledging another interrupt request while one interrupt is being serviced is called multiple interrupts. Multiple interrupts are not generated unless interrupt requests are enabled (IE = 1) (except the non-maskable interrupt). When an interrupt request is acknowledged, the other interrupts are disabled (IE = 0). To enable multiple interrupts, therefore, the IE flag must be set to 1 by executing the EI instruction during interrupt servicing and interrupts must be enabled.

Even if interrupt requests are enabled, some multiple interrupts are not acknowledged due to control by the programmable priority. An interrupt has two types of priorities: a default priority and a programmable priority. Multiple interrupts are controlled by the programmable priority.

In the EI status, if an interrupt request having the same as or higher priority than that of the interrupt currently being serviced is generated, the interrupt is acknowledged as multiple interrupt. If an interrupt request with a priority lower than that of the interrupt currently being serviced is generated, the interrupt is not acknowledged as multiple interrupt.

If interrupts are disabled, or if a multiple interrupt is not acknowledged because it has a low priority, the interrupt is held pending. After the servicing of the current interrupt is complete, and after one instruction of the main servicing has been executed, the pending interrupt is acknowledged.

Multiple interrupts are not acknowledged while the non-maskable interrupt is being serviced.

Table 14-4 shows interrupt requests enabled for multiple interrupts. Figure 14-14 shows multiple interrupt examples.

| Mı                     | Multiple Interrupt |                   | Maskable Interrupt Request |        |          |        |
|------------------------|--------------------|-------------------|----------------------------|--------|----------|--------|
|                        | Request            | Non-Maskable      | ××PF                       | R = 0  | ××PF     | R = 1  |
| Servicing Interrupt    |                    | Interrupt Request | IE = 1                     | IE = 0 | IE = 1   | IE = 0 |

| Maskable interrupt     | ISP = 0            | √                 | <b>V</b>                   | ×      | ×        | ×      |
|                        | ISP = 1            | √                 | <b>V</b>                   | ×      | <b>V</b> | ×      |
| Software interrupt     |                    | √                 | <b>V</b>                   | ×      | <b>√</b> | ×      |

Table 14-4. Interrupt Requests Enabled for Multiple Interrupt During Interrupt Servicing

# **Remarks 1.** $\sqrt{ }$ : Multiple interrupt enabled.

×: Multiple interrupt disabled.

2. ISP and IE are flags included in PSW.

ISP = 0: Interrupt with higher priority is serviced.

ISP = 1: Interrupt request is not acknowledged or interrupt with lower priority is being serviced.

IE = 0: Acknowledging interrupt request is disabled.

IE = 1: Acknowledging interrupt request is enabled.

3. ××PR is flag included in PR0L, PR0H, and PR1L.

 $\times \times PR = 0$ : Higher priority level

 $\times \times PR = 1$ : Lower priority level

Example 1. Multiple interrupt is generated twice INTxx Main servicing INTyy **INTzz** servicing servicing servicing IE = 0IE = 0IE = 0ΕI ΕI ΕI INTxx -INTyy INTzz (PR = 1)(PR = 0)(PR = 0)RETI RETI RETI

Figure 14-14. Multiple Interrupt Example (1/2)

This multiple interrupt example shows two interrupt requests, INTyy and INTzz, being acknowledged while interrupt INTxx is being serviced. Before each interrupt request is acknowledged, the EI instruction is always issued and interrupt requests are enabled.

Example 2. Multiple interrupt is not generated because of its priority

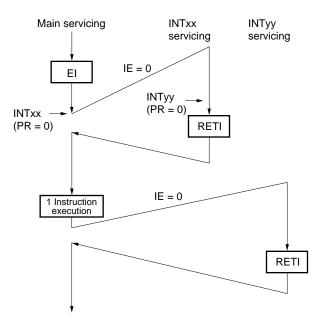

INTyy, which is generated while INTxx is being serviced, is not acknowledged and multiple interrupt servicing is not performed because the priority of INTyy is lower than that of INTxx. INTyy is held pending and is acknowledged after one instruction of the main servicing has been executed.

PR = 0: Higher priority level PR = 1: Lower priority level

IE = 0: Acknowledging interrupt request is disabled

Figure 14-14. Multiple Interrupt Example (2/2)

Example 3. Multiple interrupt is not generated because interrupts not enabled

While INTxx is serviced, other interrupts are not enabled (the EI instruction has not been executed). Therefore, INTyy is not acknowledged and multiple interrupt servicing is not performed. This interrupt (INTyy) is held pending and is acknowledged after one instruction of the main servicing has been executed.

PR = 0: Higher priority level

IE = 0: Acknowledging interrupt request is disabled

#### 14.4.5 Pending interrupt requests

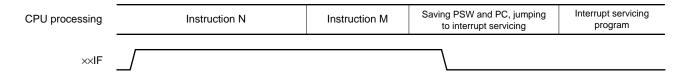

There are instructions where, even if an interrupt request is issued for them while another instruction is being executed, request acknowledgement is held pending until the end of execution of the next instruction. These instructions (instructions that have interrupt requests held pending) are listed below.

- MOV PSW, #byte
- MOV A, PSW
- MOV PSW, A
- MOV1 PSW. bit, CY
- MOV1 CY, PSW. bit
- AND1 CY, PSW. bit
- OR1 CY, PSW. bit
- XOR1 CY, PSW. bit
- , -
- SET1 PSW. bit
- CLR1 PSW. bit
- RETB
- RETI
- PUSH PSW
- POP PSW
- BT PSW. bit, \$addr16
- BF PSW. bit, \$addr16
- BTCLR PSW. bit, \$addr16
- FI
- DI
- Manipulation instruction to IF0L, IF0H, IF1L, MK0L, MK0H, MK1L, PR0L, PR0H, PR1L, EGP, EGN, EGP5, EGN5
  registers

Caution The BRK instruction is not one of the above-listed instructions that have interrupt requests held pending. However, the software interrupt activated by executing the BRK instruction causes the IE flag to be cleared to 0. Therefore, even if a maskable interrupt request is generated during execution of the BRK instruction, the interrupt request is not acknowledged. However, the non-maskable interrupt request is acknowledged.

The timing with which interrupt requests are held pending is shown in Figure 14-15.

Figure 14-15. Pending Interrupt Request

- Remarks 1. Instruction N: Instruction that has interrupt request held pending
  - 2. Instruction M: Instruction other than one which has interrupt request held pending
  - 3. The operation of  $\times$ IF (interrupt request) is not affected by the value of  $\times$ PR (priority level).

#### **CHAPTER 15 EXTERNAL DEVICE EXPANSION FUNCTION**

## 15.1 External Device Expansion Function

The external device expansion function is for connecting an external device to areas other than the internal ROM, RAM, and SFR areas. To connect an external device, ports 4 and 6 are used. Port 4 controls address/data, read/write strobe, wait, and address strobe signals.

The  $\mu$ PD780982, 780983, 780984, and 780986 can be expanded with 256 bytes of external memory. By using an external access area in the SFR area, the  $\mu$ PD780988 can be expanded with 16 bytes of external memory.

**Caution** The external device expansion function can only be used under conditions of fx = 8.38 MHz or lower, and  $V_{DD} = 4.0$  to 5.5 V.

Table 15-1. Pin Functions in External Memory Expansion Mode

| Pin Function | Alternate<br>Function        |            |
|--------------|------------------------------|------------|
| Name         | Function                     | Function   |
| AD0 to AD7   | Multiplexed address/data bus | P40 to P47 |
| RD           | Read strobe signal           | P64        |
| WR           | Write strobe signal          | P65        |
| WAIT         | Wait signal                  | P66        |
| ASTB         | Address strobe signal        | P67        |

Table 15-2. Status of Ports 4 and 6 in External Memory Expansion Mode

| Port                           | Port 4       | Port 6             |
|--------------------------------|--------------|--------------------|
| External Expansion Mode        | 0 to 7       | 4 5 6 7            |
| Single-chip mode               | Port         | Port               |
| 256-byte memory expansion mode | Address/data | RD, WR, WAIT, ASTB |

Caution When the external wait function is not used, the WAIT pin can be used as a port pin in all the modes.

The memory map is as follows when the external device expansion function is used.

Figure 15-1. Memory Map When External Device Expansion Function Used (1/3)

Figure 15-1. Memory Map When External Device Expansion Function Used (3/3)

(e) Memory map of the  $\mu$ PD78F0988A when the  $\mu$ PD780988 and flash memory capacity are 60 KB

- Cautions 1. The  $\mu$ PD78F0988A of when the  $\mu$ PD780988 and flash memory capacity is 60 KB cannot be expanded with external memory of 256 bytes. Use of the SFR area's external access area will allow 16-byte external memory expansion.
  - 2. Setting the flash memory capacity to 48 KB or less with the internal memory size switching register (IMS) will allow the  $\mu$ PD78F0988A to be expanded with 256 bytes of external memory.

# 15.2 Registers Controlling External Device Expansion Function

The external device expansion function is controlled by the following three registers.

- Memory expansion mode register (MEM)
- Memory expansion wait setting register (MM)
- Memory size switching register (IMS)

# (1) Memory expansion mode register (MEM)

MEM is a register that sets an external expansion area.

MEM is set by an 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 15-2. Format of Memory Expansion Mode Register

Symbol 5 1 0 Address After reset R/W MEM 0 0 0 0 MEM2 MEM1 MEM0 FF47H 00H W

| MEM2  | МЕМ1    | мемо | 3 - 1                    | P40 to P47, P64 | to P67 pin status |
|-------|---------|------|--------------------------|-----------------|-------------------|
|       |         |      | expansion mode selection | P40 to P47      | P64 to P67        |
| 0     | 0       | 0    | Single-chip mode         | Port mode       |                   |
| 0     | 1       | ×    | 256-byte memory          | AD0 to AD7      | P64 = RD          |
|       |         |      | expansion mode           |                 | P65 = WR          |
|       |         |      |                          |                 | P66 = WAIT        |
|       |         |      |                          |                 | P67 = ASTB        |
| Other | than ab | ove  | Setting prohibited       |                 |                   |

Caution Always set bits 3 to 7 to 0.

Remark x: don't care

## (2) Memory expansion wait setting register (MM)

MM is a register that sets the number of wait states.

MM is set by an 8-bit memory manipulation instruction.

RESET input sets this register to 10H.

Figure 15-3. Format of Memory Expansion Wait Setting Register

| Symbol | 7 | 6 | 5   | 4   | 3 | 2 | 1 | 0 | Address | After reset | R/W |
|--------|---|---|-----|-----|---|---|---|---|---------|-------------|-----|
| MM     | 0 | 0 | PW1 | PW0 | 0 | 0 | 0 | 0 | FFF8H   | 10H         | R/W |

| PW1 | PW0 | Wait state control                |
|-----|-----|-----------------------------------|
| 0   | 0   | No wait                           |
| 0   | 1   | Wait (1 wait state is inserted)   |
| 1   | 0   | Setting prohibited                |
| 1   | 1   | Wait control by external wait pin |

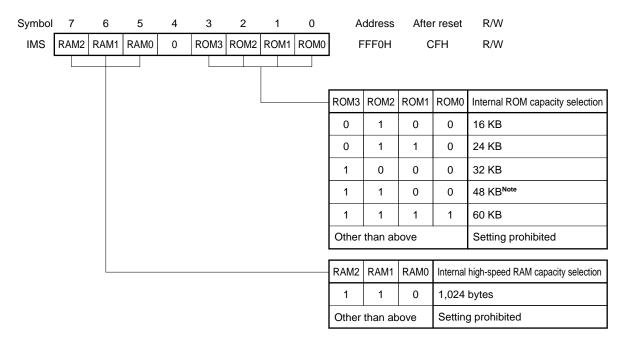

Caution To perform wait control using the external wait pin, be sure to set the WAIT/P66 pin to input mode (set bit 6 (PM66) of the port mode register 6 (PM6) to 1).

#### (3) Memory size switching register (IMS)

This register sets the capacities of the internal ROM and internal high-speed RAM. IMS is set by an 8-bit memory manipulation instruction.

RESET input sets this register to CFH.

Figure 15-4. Format of Memory Size Switching Register

**Note** Make the flash memory capacity 48 KB or less when using the external device expansion function with the  $\mu$ PD78F0988A.

- Cautions 1. The value of IMS after reset is the same (CFH) for all the products in the  $\mu$ PD780988 Subseries, regardless of the internal memory capacity. Therefore, be sure to set the value of IMS according to the internal memory capacity of the product used.
  - 2. The external memory space can be expanded in a space other than that specified by IMS, regardless of the internal memory capacity.

Table 15-3. Set Value of Internal Memory Size Switching Register

| Part Number | Set Value of IMS      |  |  |
|-------------|-----------------------|--|--|
| μPD780982   | C4H                   |  |  |
| μPD780983   | C6H                   |  |  |
| μPD780984   | C8H                   |  |  |
| μPD780986   | ССН                   |  |  |
| μPD780988   | CFH <sup>Note 1</sup> |  |  |
| μPD78F0988A | Note 2                |  |  |

- **Notes 1.** There is no need to change the set value of IMS because the initial value of the  $\mu$ PD780988 is CFH.
  - 2. Set C4H, C6H, C8H, CCH, or CFH according to the mask ROM version used.

## 15.3 Timing of External Device Expansion Function

The timing control signal output pins used in the external memory expansion mode are as follows.

#### (1) RD pin (alternate function: P64)

This pin outputs a read strobe signal when an instruction is fetched or data is accessed from the external memory.

When the internal memory is accessed, the read strobe signal is not output (instead, this pin holds a high level).

## (2) WR pin (alternate function: P65)

This pin outputs a write strobe signal when the external memory is accessed for data.

When the internal memory is accessed, the write strobe signal is not output (this pin holds a high level).

## (3) WAIT pin (alternate function: P66)

This pin inputs an external wait signal.

When the external wait signal is not used, the WAIT pin can be used as an I/O port pin.

When the internal memory is accessed, the external wait signal is ignored.

## (4) ASTB pin (alternate function: P67)

This pin outputs an address strobe signal which is always output regardless of instruction fetch or data access from the external memory.

The address strobe signal is also output when the internal memory is accessed.

#### (5) AD0 to AD7 pins (alternate function: P40 to P47)

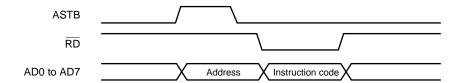

These pins output address and data signals. The valid signals are output or input when instructions are fetched or data is accessed from the external memory.

The status of the signal also changes when the internal memory is accessed (the output contents are undefined).

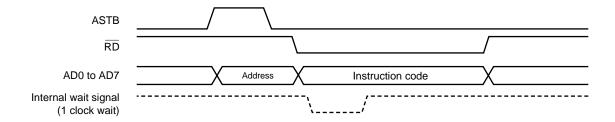

Figures 15-5 to 15-8 show the timing charts.

# 15.4 Example of Connection with Memory

Figure 15-9 shows an example of connecting the  $\mu$ PD780984 and an external memory. In this application example, SRAM is connected. In addition, the external device expansion function is used in the full address mode, and 32 KB of addresses, 0000H to 7FFFH, are allocated to internal ROM; addresses 8000H and higher are allocated to SRAM.

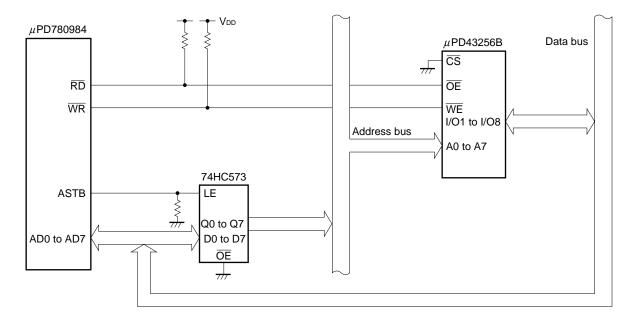

Figure 15-9. Example of Connecting  $\mu$ PD780984 and Memory

#### **CHAPTER 16 STANDBY FUNCTION**

#### 16.1 Standby Function and Configuration

#### 16.1.1 Standby function

The standby function is used to reduce the current consumption of the system and can be effected in the following two modes.

#### (1) HALT mode

This mode is set when the HALT instruction is executed. The HALT mode stops the operation clock of the CPU. The system clock oscillator continues oscillating. This mode does not reduce the current consumption as much as the STOP mode, but is useful for resuming processing immediately when an interrupt request is generated, or for intermittent operations such as a watch operation.

#### (2) STOP mode

This mode is set when the STOP instruction is executed. The STOP mode stops the system clock oscillator and stops the entire system. The current consumption of the CPU can be substantially reduced in this mode. The low voltage ( $V_{DD} = 2.0 \text{ V}$ ) of the data memory can be retained. Therefore, this mode is useful for retaining the contents of the data memory at an extremely low current.

The STOP mode can be released by an interrupt request, so this mode can be used for intermittent operation. However, a certain amount of time is required until the system clock oscillator stabilizes after the STOP mode is released. If processing must be resumed immediately by using an interrupt request, therefore, use the HALT mode.

In both modes, the previous contents of the registers, flags, and data memory before setting the standby mode are all retained. In addition, the statuses of the output latch of the I/O ports and output buffer are also retained.

- Cautions 1. To set the STOP mode, be sure to stop the operations of the peripheral hardware before executing the STOP instruction.
  - 2. To reduce the current consumption of the A/D converter, clear bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) to 0 to stop A/D conversion, and then execute the HALT or STOP instruction.

### 16.1.2 Register controlling standby function

The wait time during which oscillation is stabilized after the STOP mode is released by an interrupt request is controlled by the oscillation stabilization time select register (OSTS).

OSTS is set by an 8-bit memory manipulation instruction.

 $\overline{\text{RESET}}$  input sets this register to 04H. Therefore, to release the STOP mode by inputting the  $\overline{\text{RESET}}$  signal, the time required to release the mode is  $2^{17}/\text{fx}$ .

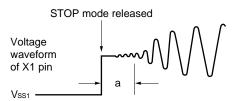

Figure 16-1. Format of Oscillation Stabilization Time Select Register

| Symbol | 7 | 6 | 5 | 4 | 3 | 2     | 1     | 0     | Address | After reset | R/W |
|--------|---|---|---|---|---|-------|-------|-------|---------|-------------|-----|
| OSTS   | 0 | 0 | 0 | 0 | 0 | OSTS2 | OSTS1 | OSTS0 | FFFAH   | 04H         | R/W |

|------------------|-------|-------------|---|--------------------------------|------------------|--|--|--|
|                  |       |             |   | At fx = 12 MHz <sup>Note</sup> | At fx = 8.38 MHz |  |  |  |
| 0                | 0     | 0           | 2 <sup>12</sup> /fx   | 341.3 μs                       | 488.8 μs         |  |  |  |
| 0                | 0     | 1           | 2 <sup>14</sup> /fx   | 1.36 ms                        | 1.96 ms          |  |  |  |
| 0                | 1     | 0           | 2 <sup>15</sup> /fx   | 2.73 ms                        | 3.91 ms          |  |  |  |
| 0                | 1     | 1           | 2 <sup>16</sup> /fx   | 5.46 ms                        | 7.82 ms          |  |  |  |
| 1                | 0     | 0           | 2 <sup>17</sup> /fx   | 10.9 ms                        | 15.6 ms          |  |  |  |
| Other than above |       | Setting pro | phibited  |                                |                  |  |  |  |

Note Expanded-specification products only.

Caution The wait time when the STOP mode is released does not include the time required for the clock oscillation to start after the STOP mode has been released (see "a" in the figure below). The same applies when the STOP mode is released by RESET input or generation of an interrupt request.

Remark fx: System clock oscillation frequency

# 16.2 Operation of Standby Function

# 16.2.1 HALT mode

# (1) Setting and operation status of HALT mode

The HALT mode is set by executing the HALT instruction.

The operation status in the HALT mode is shown in the table below.

Table 16-1. Operation Status in HALT Mode

|                       | Item       | Operation Status                                  |  |  |  |
|-----------------------|------------|---|--|--|--|
| Clock generator       |            | Oscillatable Supply of clock to CPU is stopped.   |  |  |  |
| CPU                   |            | Stops operation.                                  |  |  |  |
| Port (output latch)   |            | Retains previous status before setting HALT mode. |  |  |  |

| Serial interface      |            |   |  |  |  |
| External interrupt    |            |   |  |  |  |
| Externally            | AD0 to AD7 | High impedance                                    |  |  |  |
| extended bus line     | ASTB       | Low level   |  |  |  |
|                       | WR, RD     | High level  |  |  |  |
|                       | WAIT       | High impedance                                    |  |  |  |

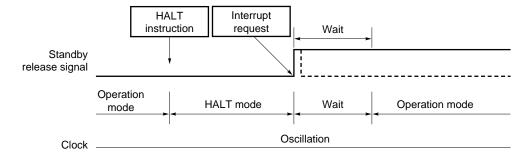

#### (2) Releasing HALT mode

The HALT mode can be released by the following three sources.

#### (a) Releasing by unmasked interrupt request

If an unmasked interrupt request is generated, the HALT mode is released. If the interrupt request is enabled at this time, vectored interrupt servicing is performed. If the interrupt request is disabled, the instruction at the next address is executed.

Figure 16-2. Releasing HALT Mode by Interrupt Request

- **Remarks 1.** The dotted lines indicate the case when the interrupt request that has released the standby mode is acknowledged.
  - 2. The wait time is as follows.

When vectored interrupt servicing is performed: 8 to 9 clocks
When vectored interrupt servicing is not performed: 2 to 3 clocks

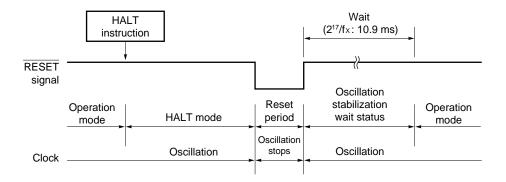

# (b) Releasing by non-maskable interrupt request

If a non-maskable interrupt request is generated, the HALT mode is released regardless of whether interrupt requests are enabled or disabled, and vectored interrupt servicing is performed.

# (c) Releasing by RESET input

If the RESET signal is input, the HALT mode is released. After branching to the reset vector address in the same manner as the ordinary reset operation, and program execution is started again.

Figure 16-3. Releasing HALT Mode by RESET Input

Remarks 1. fx: System clock oscillation frequency

**2.** The parenthesized values apply to operation at fx = 12 MHz.

Table 16-2. Operation After Release of HALT Mode

| Releasing Source               | MK×× | PR×× | IE | ISP | Operation                          |
|--------------------------------|------|------|----|-----|------------------------------------|
| Maskable interrupt request     | 0    | 0    | 0  | ×   | Executes next address instruction. |
|                                | 0    | 0    | 1  | ×   | Executes interrupt servicing.      |
|                                | 0    | 1    | 0  | 1   | Executes next address instruction. |
|                                | 0    | 1    | ×  | 0   |                                    |
|                                | 0    | 1    | 1  | 1   | Executes interrupt servicing.      |
|                                | 1    | ×    | ×  | ×   | Retains HALT mode.                 |
| Non-maskable interrupt request | _    | _    | ×  | ×   | Executes interrupt servicing.      |
| RESET input                    | -    | -    | ×  | ×   | Executes reset processing.         |

×: don't care

#### 16.2.2 STOP mode

#### (1) Setting and operation status of STOP mode

The STOP mode is set by executing the STOP instruction.

- Cautions 1. When the STOP mode is set, the X2 pin is internally pulled up to V<sub>DD1</sub> to suppress the current leakage of the crystal oscillator block. Therefore, do not use the STOP mode in a system where the external clock is used as the system clock.
  - 2. Because the standby mode can be released by an interrupt request signal, the standby mode is released as soon as it is set if there is an interrupt source whose interrupt request flag is set and interrupt mask flag is reset. When the STOP mode is set, therefore, the HALT mode is set immediately after the STOP instruction has been executed, the wait time set by the oscillation stabilization time select register (OSTS) elapses, and then an operation mode is set.

The following table shows the operation status in the STOP mode.

Table 16-3. Operation Status in STOP Mode

| Item                  |                   | Operation Status  |  |  |  |  |  |
|-----------------------|-------------------|---|--|--|--|--|--|
| Clock generator       |                   | Oscillation stopped.  |  |  |  |  |  |
| CPU                   |                   | Stops operation.  |  |  |  |  |  |
| Output port           | t (output latch)  | Retains previous status immediately before STOP instruction execution.  |  |  |  |  |  |
| 16-bit timer          | r/event counter   | Operable only when Tl000 or Tl001 is selected as count clock.   |  |  |  |  |  |
| 8-bit timer/          | event counter     | Operable only when TI50, TI51, or TI52 is selected as count clock.  |  |  |  |  |  |
| 10-bit inver          | ter control timer | Stops operation.  |  |  |  |  |  |
| Watchdog              | timer             | Stops operation.  |  |  |  |  |  |
| Real-time o           | putput port       | Operable when external trigger is used or when TI010, TI011, or TI52 is selected as count clock of timer/event counter. |  |  |  |  |  |
| A/D conver            | ter               | Stops operation.  |  |  |  |  |  |

### (2) Releasing STOP mode

The STOP mode can be released by the following two sources.

### (a) Releasing by unmasked interrupt request

If an unmasked interrupt request is generated, the STOP mode can be released. If interrupt requests are enabled at this time, vectored interrupt servicing is performed, after the oscillation stabilization time has elapsed. If interrupt requests are in the acknowledgement disabled status, the instruction at the next address is executed.

Figure 16-4. Releasing STOP Mode by Interrupt Request

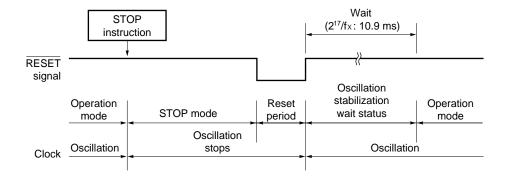

**Remark** The dotted lines indicate the case when the interrupt request that has released the standby mode is acknowledged.

# (b) Releasing by RESET input

If the RESET signal is input, the STOP mode is released. The reset operation is performed after the oscillation stabilization time has elapsed.

Figure 16-5. Releasing STOP Mode by RESET Input

Remarks 1. fx: System clock oscillation frequency

**2.** The parenthesized values apply to operation at fx = 12 MHz.

Table 16-4. Operation After Release of STOP Mode

| Releasing Source           | MK×× | PR×× | IE | ISP | Operation                          |
|----------------------------|------|------|----|-----|------------------------------------|
| Maskable interrupt request | 0    | 0    | 0  | ×   | Executes next address instruction. |
|                            | 0    | 0    | 1  | ×   | Executes interrupt servicing.      |
|                            | 0    | 1    | 0  | 1   | Executes next address instruction. |

x: don't care

#### **CHAPTER 17 RESET FUNCTION**

The reset signal can be effected by the following two methods.

- (1) External reset input from RESET pin
- (2) Internal reset by inadvertent program loop detection by watchdog timer

There is no functional difference between the external reset and internal reset, and execution of the program is started from addresses written to addresses 0000H and 0001H when the  $\overline{\text{RESET}}$  signal is input.

The reset function is effected when a low-level signal is input to the RESET pin or when an overflow occurs in the watchdog timer. As a result, each hardware enters the status shown in Table 17-1. Each pin goes into a high-impedance state while the RESET signal is input, and during the oscillation stabilization time immediately after the reset function has been released.

When a high-level signal is input to the  $\overline{\text{RESET}}$  pin, the reset function is released, and program execution is started after oscillation stabilization time ( $2^{17}/\text{fx}$ ) has elapsed. The reset function effected by an overflow in the watchdog timer is automatically released after reset, and program execution is started after the oscillation stabilization time ( $2^{17}/\text{fx}$ ) has elapsed (refer to **Figures 17-2** to **17-4**).

Cautions 1. Input a low-level signal to the  $\overline{RESET}$  pin for 10  $\mu s$  or longer to execute an external reset.

- 2. Oscillation of the system clock is stopped while the RESET signal is being input.
- When releasing the STOP mode by the RESET input, the contents during the STOP mode are retained while the RESET signal is being input. However, the port pins go into a highimpedance state.

|                               | External interrupt falling edge enable registers (EGN, EGN5)    | 00H                |

### CHAPTER 18 $\mu$ PD78F0988A

The  $\mu$ PD78F0988A replaces the on-chip mask ROM of the  $\mu$ PD780988 with flash memory, which can be written, deleted, and rewritten while mounted on the board. Table 18-1 lists the differences between the  $\mu$ PD78F0988A and the mask ROM versions.

Table 18-1. Differences Between  $\mu$ PD78F0988A and Mask ROM Versions

| Item                            | μPD78F0988A                   | Mask ROM Versions  |
|---------------------------------|-------------------------------|--|
| Internal ROM type               | Flash memory                  | Mask ROM   |
| Internal ROM capacity           | 60 KBNote 1                   | μPD780982: 16 KB<br>μPD780983: 24 KB<br>μPD780984: 32 KB<br>μPD780986: 48 KB<br>μPD780988: 60 KB |
| Internal expansion RAM capacity | 1,024 bytes <sup>Note 2</sup> | μPD780982, 780983, 780984: None<br>μPD780986, 780988: 1,024 bytes                                |
| TEST pin                        | Not available                 | Available  |
| V <sub>PP</sub> pin             | Available                     | Not available  |

- **Notes 1.** By using the internal memory size switching register (IMS), the flash memory capacity can be set to the same capacity as the memory in the mask ROM versions.
  - **2.** By using the internal expansion RAM size switching register (IXS), the flash memory capacity can be set to the same capacity as the memory in the mask ROM versions.

Caution There are differences in noise immunity and noise radiation between the flash memory versions and mask ROM versions. When pre-producing an application set with the flash memory version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluations for the commercial samples (not engineering samples) of the mask ROM versions.

### 18.1 Internal Memory Size Switching Register

For the  $\mu$ PD78F0988A, it is possible to select the capacity of the internal memory using the internal memory size switching register (IMS). By setting IMS, the internal memory of the  $\mu$ PD78F0988 can be mapped identically to that of a mask ROM version.

IMS is set by an 8-bit memory manipulation instruction.

RESET input sets this register to CFH.

Symbol R/W 6 5 3 2 0 Address After reset ROM3 ROM2 ROM1 ROM0 IMS RAM2 RAM1 RAM0 0 FFF0H CFH R/W ROM3 ROM2 ROM1 ROM0 Internal ROM capacity selection 0 16 KB 0 1 1 0 24 KB 0 32 KB 0 48 KB 1 1 0 1 1 60 KB Other than above Setting prohibited RAM2 RAM1 RAM0 Internal high-speed RAM capacity selection 1024 bytes Other than above Setting prohibited

Figure 18-1. Format of Memory Size Switching Register

The values set to IMS in order to obtain the same memory map as mask ROM versions are shown in Table 18-2.

| Applicable Mask ROM Versions | Set Value of IMS |
|------------------------------|------------------|
| μPD780982                    | C4H              |
| μPD780983                    | С6Н              |

| μΡD780986                    | ССН              |
| μPD780988                    | CFH              |

Table 18-2. Set Values of Memory Size Switching Register

Caution When mask ROM versions are used, IMS should be set to the values shown in Table 18-2. The setting value for the  $\mu$ PD780988 is CFH, so it is not necessary to change the initial value.

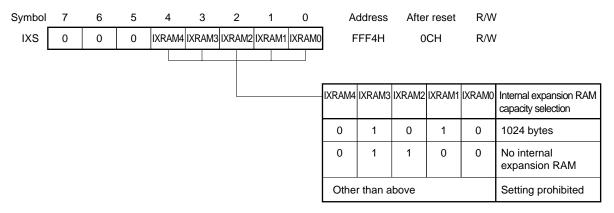

#### 18.2 Internal Expansion RAM Size Switching Register

For the  $\mu$ PD78F0988A, it is possible to select the capacity of the internal expansion RAM using the internal expansion RAM size switching register (IXS). By setting IXS, the same memory map as mask ROM versions with different internal expansion RAM capacities is possible.

IXS is set by an 8-bit memory manipulation instruction.

RESET input sets this register to 0CH.

Figure 18-2. Format of Internal Expansion RAM Size Switching Register

The values set to IXS in order to obtain the same memory map as mask ROM versions are shown in Table 18-3.

Table 18-3. Set Values of Internal Expansion RAM Size Switching Register

| Applicable Mask ROM Versions | Set Value of IXS |
|------------------------------|------------------|
| μPD780982                    | 0CH              |
| μPD780983                    |                  |
| μPD780984                    |                  |
| μPD780986                    | 0AH              |
| μPD780988                    |                  |

Caution When mask ROM versions are used, IXS should be set to the values shown in Table 18-3. The setting value for the  $\mu$ PD780982, 780983, and 780984 is 0CH, so it is not necessary to change the initial value.

### **★ 18.3 Flash Memory Characteristics**

Flash memory programming is performed by connecting a dedicated flash programmer (Flashpro III (part no. FL-PR3, PG-FP3)/Flashpro IV (part no. FL-PR4, PG-FP4)) to the target system with the  $\mu$ PD78F0988A mounted (onboard). A flash memory writing adapter (program adapter), which is a target board used exclusively for programming, is also provided.

**Remark** FL-PR3, FL-PR4, and the program adapter are the products made by Naito Densei Machida Mfg. Co., Ltd. (TEL +81-45-475-4191).

Write or erase the flash memory under the following conditions.

- Expanded-specification products
  - $4.5 \text{ V} \le \text{V}_{DD} \le 5.5 \text{ V}$ : fx = 10.0 MHz or lower
  - 3.0 V  $\leq$  V<sub>DD</sub> < 4.5 V: fx = 8.38 MHz or lower
- Conventional products
  - 4.0 V  $\leq$  V<sub>DD</sub>  $\leq$  5.5 V: fx = 8.38 MHz or lower

Refer to CHAPTER 20 ELECTRICAL SPECIFICATIONS (EXPANDED-SPECIFICATION PRODUCTS) and CHAPTER 21 ELECTRICAL SPECIFICATIONS (CONVENTIONAL PRODUCTS) for details of conditions other than the above.

Programming using flash memory has the following advantages.

- Software can be modified after the microcontroller is solder-mounted on the target system.
- · Distinguishing software facilities low-quantity, varied model production
- Easy data adjustment when starting mass production

### 18.3.1 Programming environment

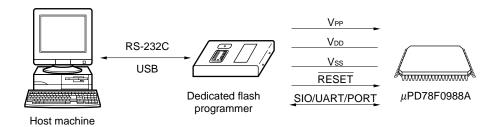

The following shows the environment required for  $\mu$ PD78F0988A flash memory programming.

When Flashpro III or Flashpro IV is used as a dedicated flash programmer, a host machine is required to control the dedicated flash programmer. Communication between the host machine and flash programmer is performed via RS-232C/USB (Rev. 1.1).

For details, refer to the manuals for Flashpro III/Flashpro IV.

Remark USB is supported by Flashpro IV only.

Figure 18-3. Environment for Writing Program to Flash Memory

#### 18.3.2 Communication mode

Use the communication mode shown in Table 18-4 to perform communication between the dedicated flash programmer and  $\mu$ PD78F0988A.

Table 18-4. Communication Mode List

| Communication                                 |                                 | T                                    |           | Pins Used             | Number of VPP |  |        |
|---|---------------------------------|--------------------------------------|-----------|-----------------------|---------------|--|--------|
| Mode  | COMM PORT                       | SIO Clock                            | CPU CLOCK | Flash Clock           | Multiple Rate |  | Pulses |
| 3-wire serial I/O<br>(SIO3)                   | SIO ch-0<br>(3-wired,<br>sync.) | 100 Hz to<br>1.25 MHz<br>Note 2      | Any       | 1 to 10 MHz<br>Note 2 | 1.0           | SI/P52<br>SO/P53<br>SCK/P51  | 0      |
| 3-wire serial I/O (SIO3) with handshake       | SIO ch-3<br>+ handshake         |                                      |           |                       |               | SI/P52<br>SO/P53<br>SCK/P51<br>P50 (HS)  | 3      |
| UART<br>(UART00)                              | UART ch-0<br>(Async.)           | 4,800 to<br>76,800 bps<br>Notes 2, 4 | Any       | 1 to 10 MHz<br>Note 2 | 1.0           | RxD00/P20<br>TxD00/P21   | 8      |
| Pseudo 3-wire<br>serial I/O <sup>Note 3</sup> | PORT A<br>(Pseudo-<br>3-wired)  | 100 Hz to 1<br>kHzNote 2             | Any       | 1 to 10 MHz<br>Note 2 | 1.0           | P24/TI50/TO50<br>(serial data input)<br>P25/TI51/TO51<br>(serial data output)<br>P26/TI52/TO52<br>(serial clock input) | 12     |

- Notes 1. Selection items for TYPE settings on the dedicated flash programmer (Flashpro III/Flashpro IV).
  - 2. The possible setting range differs depending on the voltage. For details, refer to CHAPTER 20 ELECTRICAL SPECIFICATIONS (EXPANDED-SPECIFICATION PRODUCTS) and CHAPTER 21 ELECTRICAL SPECIFICATIONS (CONVENTIONAL PRODUCTS).
  - 3. Serial transfer is executed by controlling the port with software.
  - **4.** Because factors other than the baud rate error, such as the signal waveform slew, also affect UART communication, thoroughly evaluate the slew as well as the baud rate error.

Figure 18-4. Communication Mode Selection Format

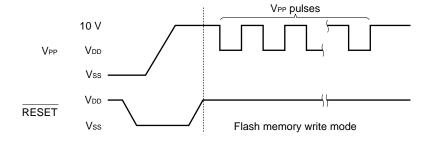

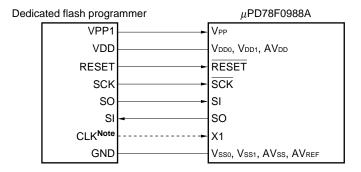

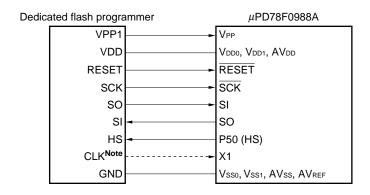

Figure 18-5. Example of Connection with Dedicated Flash Programmer (1/2)

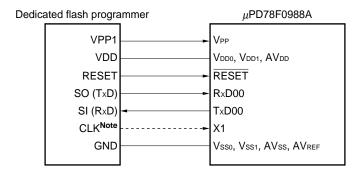

### (a) 3-wire serial I/O (SIO3)

# (b) 3-wire serial I/O (SIO3) with handshake

# (c) UART (UART00)

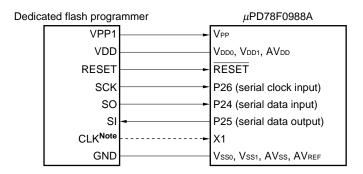

**Note** Connect this pin when the system clock is supplied from the dedicated flash programmer. If a resonator is already connected to the X1 pin, the CLK pin does not need to be connected.

Caution The V<sub>DD0</sub> and V<sub>DD1</sub> pins, if already connected to the power supply, must be connected to the VDD pin of the dedicated flash programmer. Before using the power supply connected to the V<sub>DD0</sub> and V<sub>DD1</sub> pins, supply voltage before starting programming.

Figure 18-5. Example of Connection with Dedicated Flash Programmer (2/2)

#### (d) Pseudo 3-wire serial I/O

**Note** Connect this pin when the system clock is supplied from the dedicated flash programmer. If a resonator is already connected to the X1 pin, the CLK pin does not need to be connected.

Caution The V<sub>DD0</sub> and V<sub>DD1</sub> pins, if already connected to the power supply, must be connected to the VDD pin of the dedicated flash programmer. Before using the power supply connected to the V<sub>DD0</sub> and V<sub>DD1</sub> pins, supply voltage before starting programming.

If Flashpro III/Flashpro IV is used as a dedicated flash programmer, the following signals are generated for the  $\mu$ PD78F0988A. For details, refer to the manual of Flashpro III/Flashpro IV.

Table 18-5. Pin Connection List

| Signal Name | I/O    | Pin Function  | Pin Name                | SIO3   | SIO3 (HS) | UART00 | Pseudo<br>3-Wired |  |  |
|-------------|--------|---|-------------------------|--------|-----------|--------|-------------------|--|--|
| VPP1        | Output | Write voltage   | VPP                     | 0      | 0         | 0      | 0                 |  |  |
| VPP2        | _      | -   | -                       | ×      | ×         | ×      | ×                 |  |  |
| VDD         | I/O    | V <sub>DD</sub> voltage generation/<br>voltage monitoring | VDD0, VDD1, AVDD        | ○ Note | ○ Note    | Note   | ○ Note            |  |  |
| GND         | _      | Ground  | Vsso, Vss1, AVss, AVref | 0      | 0         | 0      | 0                 |  |  |
| CLK         | Output | Clock output  | X1                      | 0      | 0         | 0      | 0                 |  |  |
| RESET       | Output | Reset signal  | RESET                   | 0      | 0         | 0      | 0                 |  |  |
| SI (RxD)    | Input  | Reception signal  | SO/TxD00/P25            | 0      | 0         | 0      | 0                 |  |  |
| SO (TxD)    | Output | Transmit signal   | SI/RxD00/P24            | 0      | 0         | 0      | 0                 |  |  |
| SCK         | Output | Transfer clock  | SCK/P26                 | 0      | 0         | ×      | 0                 |  |  |
| HS          | Input  | Handshake signal  | P50 (HS)                | ×      | 0         | ×      | × ×               |  |  |

**Note** V<sub>DD</sub> voltage must be supplied before programming is started.

Remark : Pin must be connected.

O: If the signal is supplied on the target board, pin need not be connected.

x: Pin need not be connected.

#### 18.3.3 On-board pin processing

When performing programming on the target system, provide a connector on the target system to connect the dedicated flash programmer.

An on-board function that allows switching between normal operation mode and flash memory programming mode may be required in some cases.

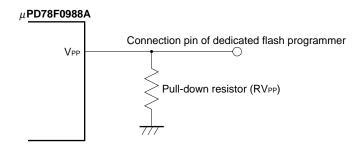

#### <VPP pin>

In normal operation mode, input 0 V to the VPP pin. In flash memory programming mode, a write voltage of 10.0 V (TYP.) is supplied to the VPP pin, so perform the following.

- (1) Connect a pull-down resistor (RVPP = 10 k $\Omega$ ) to the VPP pin.
- (2) Use the jumper on the board to switch the VPP pin input to either the writer or directly to GND.

A VPP pin connection example is shown below.

Figure 18-6. VPP Pin Connection Example

#### <Serial interface pin>

The following shows the pins used by the serial interface.

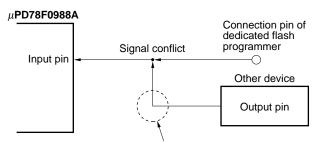

| Serial Interface                        | Pins Used             |
|---|-----------------------|
| 3-wire serial I/O (SIO3)                | SI, SO, SCK           |
| 3-wire serial I/O (SIO3) with handshake | SI, SO, SCK, P50 (HS) |
| UART (UART00)                           | RxD00, TxD00          |
| Pseudo 3-wire serial I/O                | P24, P25, P26         |

When connecting the dedicated flash programmer to a serial interface pin that is connected to another device onboard, signal conflict or abnormal operation of the other devices may occur. Care must therefore be taken with such connections.

#### (1) Signal conflict

If the dedicated flash programmer (output) is connected to a serial interface pin (input) that is connected to another device (output), a signal conflict occurs. To prevent this, isolate the connection with the other device or set the other device to the output high impedance status.

Figure 18-7. Signal Conflict (Input Pin of Serial Interface)

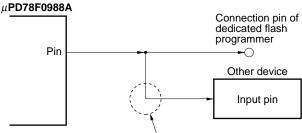

In the flash memory programming mode, the signal output by another device and the signal sent by the dedicated flash programmer conflict, therefore, isolate the signal of the other device.

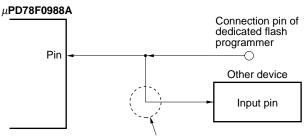

#### (2) Abnormal operation of other device

If the dedicated flash programmer (output or input) is connected to a serial interface pin (input or output) that is connected to another device (input), a signal is output to the device, and this may cause an abnormal operation. To prevent this abnormal operation, isolate the connection with the other device or set so that the input signals to the other device are ignored.

Figure 18-8. Abnormal Operation of Other Device

If the signal output by the  $\mu$ PD78F0988A affects another device in the flash memory programming mode, isolate the signals of the other device.

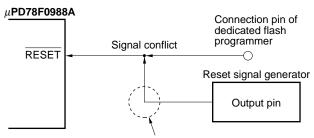

If the signal output by the dedicated flash programmer affects another device in the flash memory programming mode, isolate the signals of the other device.

#### <RESET pin>

If the reset signal of the dedicated flash programmer is connected to the RESET pin connected to the reset signal generator on-board, a signal conflict occurs. To prevent this, isolate the connection with the reset signal generator. If the reset signal is input from the user system in the flash memory programming mode, a normal programming operation cannot be performed. Therefore, do not input reset signals from other than the dedicated flash programmer.

Figure 18-9. Signal Conflict (RESET Pin)

The signal output by the reset signal generator and the signal output from the dedicated flash programmer conflict in the flash memory programming mode, so isolate the signal of the reset signal generator.

#### <Port pins>

When the  $\mu$ PD78F0988A enter the flash memory programming mode, all the pins other than those that communicate in flash programmer are in the same status as immediately after reset.

If the external device does not recognize initial statuses such as the output high impedance status, therefore, connect the external device to VDD0 or VSS0 via a resistor.

#### <Oscillator>

When using the on-board clock, connect X1 and X2 as required in the normal operation mode.

When using the clock output of the flash programmer, connect it directly to X1, disconnecting the main oscillator on-board, and leave the X2 pin open.

### <Power supply>

To use the power output from the flash programmer, connect the VDD0 and VDD1 pins to VDD of the flash programmer, and the Vss0 and Vss1 pins to GND of the flash programmer.

To use the on-board power supply, make connections that accord with the normal operation mode. However, because the voltage is monitored by the flash programmer, be sure to connect VDD of the flash programmer. Supply the same power as in the normal operation mode to the other power supply pins (AVDD and AVss).

### <Other pins>

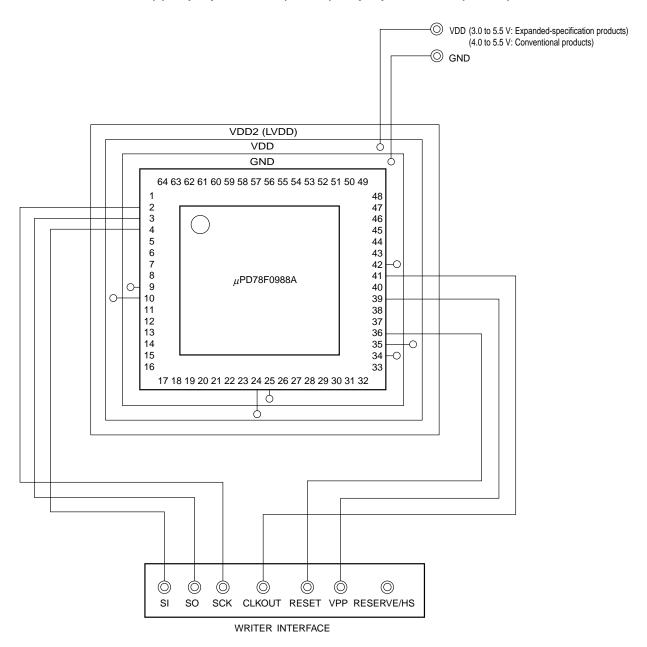

Process the other pins (TO70 to TO75, AVREF, and TEST) in the same manner as in the normal operation mode.

#### 18.3.4 Connection of adapter for flash writing

The following figures show the examples of recommended connection when the adapter for flash writing is used.

Figure 18-10. Wiring Example for Flash Writing Adapter with 3-Wire Serial I/O (SIO3)

(a) 64-pin plastic QFP (14  $\times$  14), 64-pin plastic LQFP (14  $\times$  14)

# (b) 64-pin plastic SDIP (19.05 mm (750))

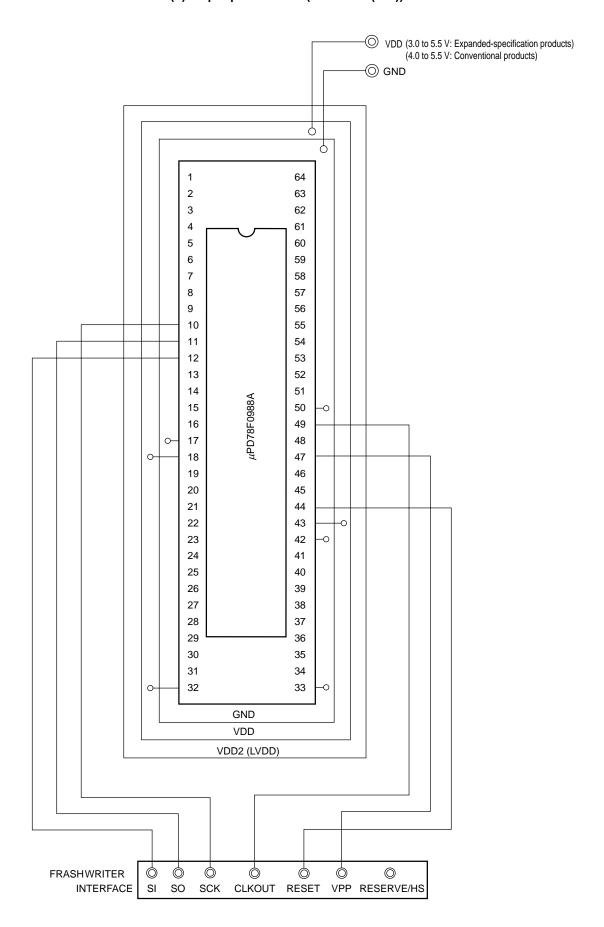

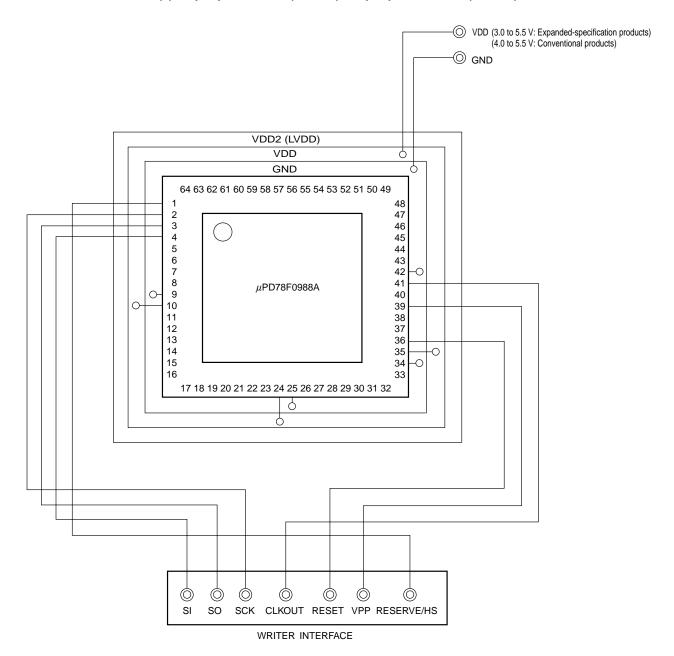

Figure 18-11. Wiring Example for Flash Writing Adapter with 3-Wire Serial I/O (SIO3) with Handshake

# (a) 64-pin plastic QFP (14 $\times$ 14), 64-pin plastic LQFP (14 $\times$ 14)

# (b) 64-pin plastic SDIP (19.05 mm (750))

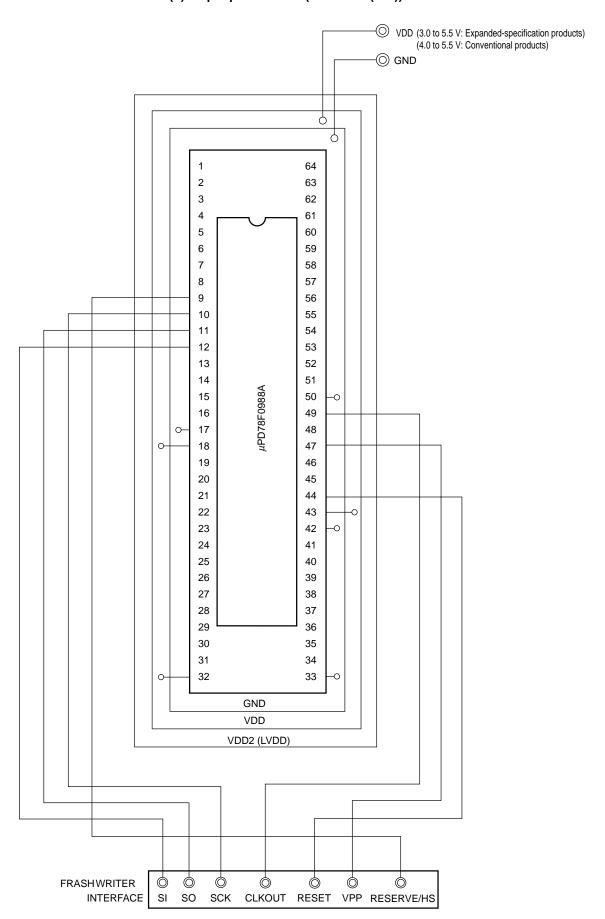

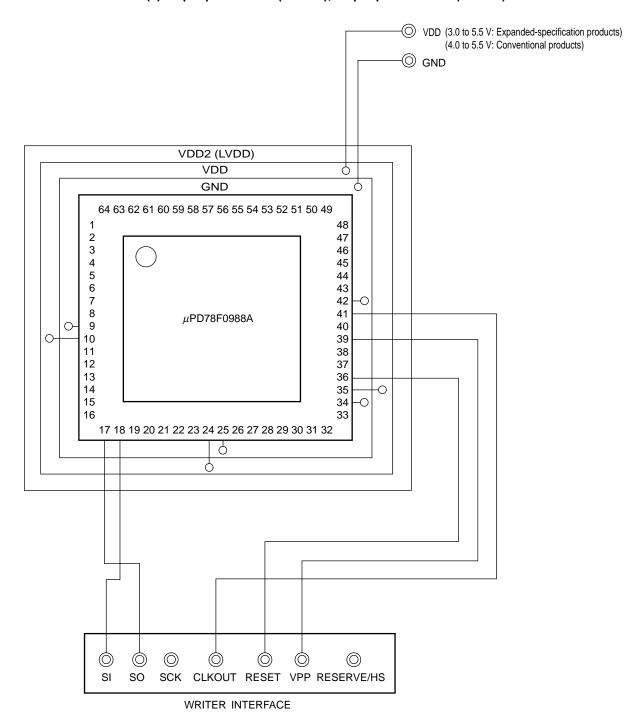

Figure 18-12. Wiring Example for Flash Writing Adapter with UART (UART00)

# (a) 64-pin plastic QFP (14 $\times$ 14), 64-pin plastic LQFP (14 $\times$ 14)

# (b) 64-pin plastic SDIP (19.05 mm (750))

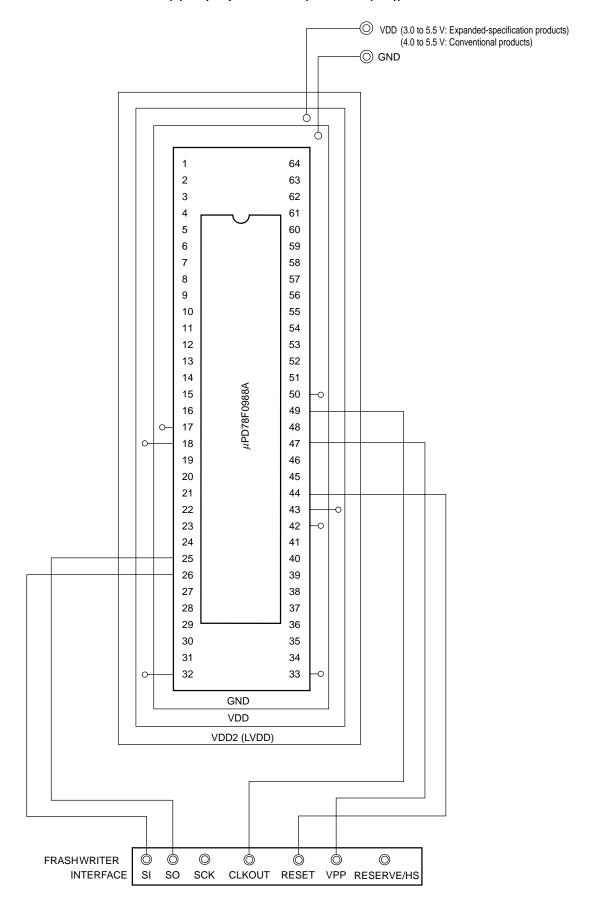

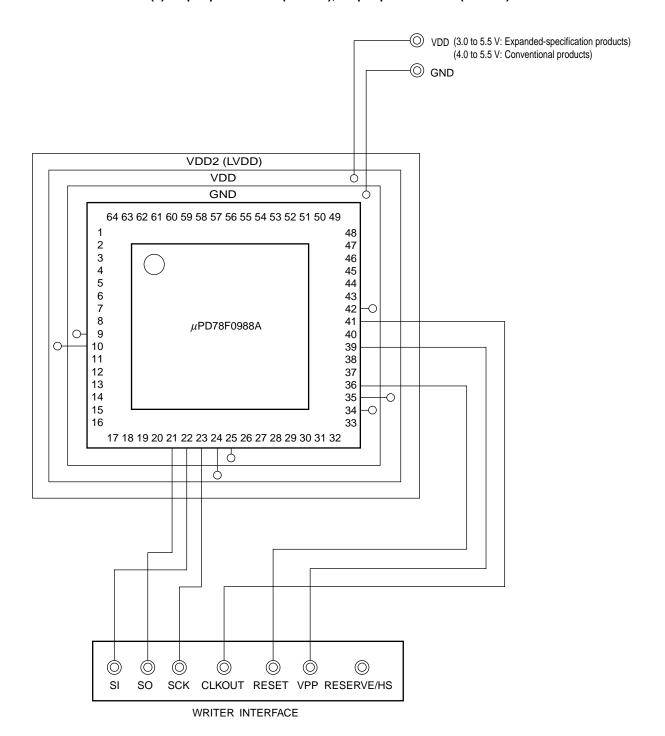

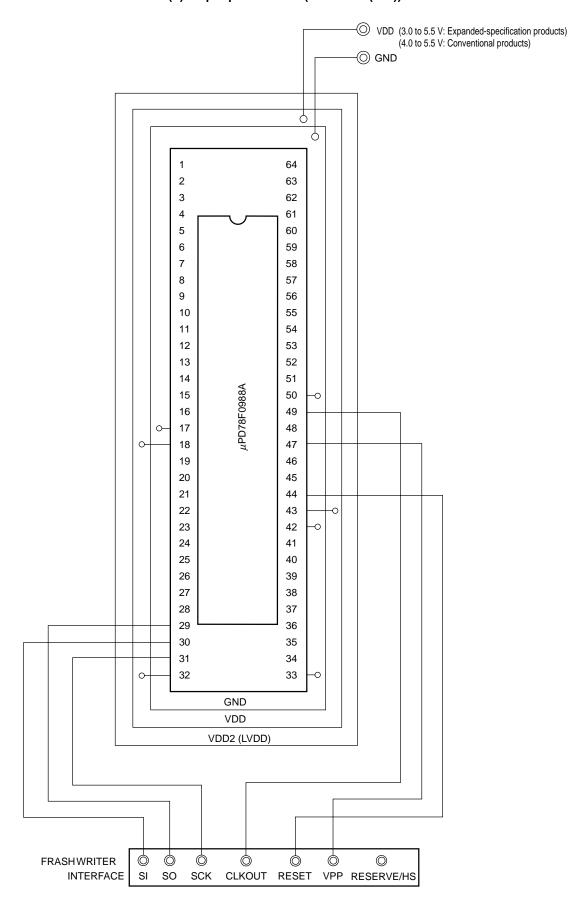

Figure 18-13. Wiring Example for Flash Writing Adapter with Pseudo 3-Wire Serial I/O

# (a) 64-pin plastic QFP (14 $\times$ 14), 64-pin plastic LQFP (14 $\times$ 14)

# (b) 64-pin plastic SDIP (19.05 mm (750))

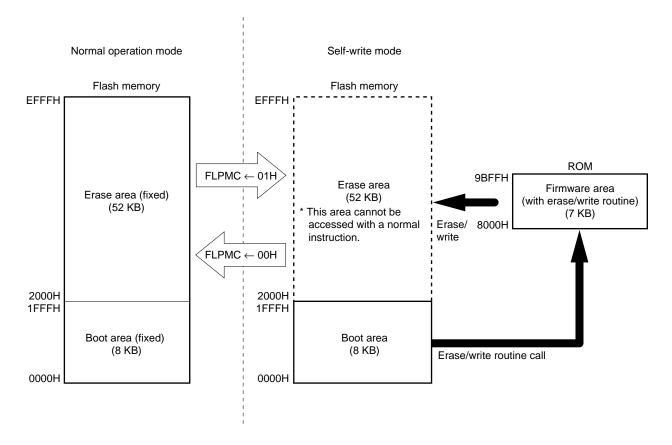

# 18.4 Flash Memory Programming by Self Write

With the  $\mu$ PD78F0988A, it is possible to rewrite the flash memory by a program.

# 18.4.1 Flash memory configuration

The configuration of the flash memory is shown in Figure 18-14.

Figure 18-14. Flash Memory Configuration

#### 18.4.2 Flash programming mode control register

The flash programming mode control register (FLPMC) is a register for checking the operation mode selection and VPP pin status.

FLPMC is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 08H.

Figure 18-15. Format of Flash Programming Mode Control Register

| Symbol | 7 | 6 | 5 | 4 | 3 | 2   | 1 | 0      | Address | After reset           | R/W                   |
|--------|---|---|---|---|---|-----|---|--------|---------|-----------------------|-----------------------|
| FLPMC  | 0 | 0 | 0 | 0 | 1 | VPP | 0 | FLSPM0 | FF89H   | 08H <sup>Note 1</sup> | R/W <sup>Note 2</sup> |

| VPP | V <sub>PP</sub> pin voltage status  |
|-----|---|
| 0   | The voltage required for erase/write is not applied to V <sub>PP</sub> pin.         |
| 1   | Voltage greater than that of $V_{\text{DD}}$ pin is applied to $V_{\text{PP}}$ pin. |

| FLSPM0 | Operation mode selection |  |  |  |  |
|--------|--------------------------|--|--|--|--|
| 0      | Normal operation mode    |  |  |  |  |
| 1      | Self-write mode          |  |  |  |  |

- Notes 1. Bit 2 changes depending on the level of VPP.
  - 2. Bit 2 is read only.
- Cautions 1. The VPP bit indicates the status of the voltage applied to the VPP pin. If the VPP bit is 0, the voltage required for erase/write is not being applied. However, even if the VPP bit is 1, it does not necessarily mean that the voltage required for erase/write is being applied. Set the hardware so that the voltage required for erase/write is applied to the VPP pin.

  Also, if using software in addition to hardware to check that the voltage required for erase/write is being applied, use an external hardware detection circuit and its output.
  - 2. The initial values of bits 1 and 3 to 7 should not be changed.

# 18.4.3 Self-write procedure

The procedure for performing self write is shown below (see Figure 18-16).

- (1) Disable interrupts.
- (2) Designate the self-write mode (FLPMC = 09H).
- (3) Select register bank 3.
- (4) Specify the start address of the entry RAM for the HL register.
- (5) VPP: ON (ON signal for voltage IC)
- (6) Check the VPP level.
- (7) Initialize the flash subroutine.
- (8) Set the parameters.
- (9) Control the flash memory (erase, write, etc.).
- (10) VPP: OFF (OFF signal for voltage IC)
- (11) Designate the normal operating mode (FLPMC = 08H).

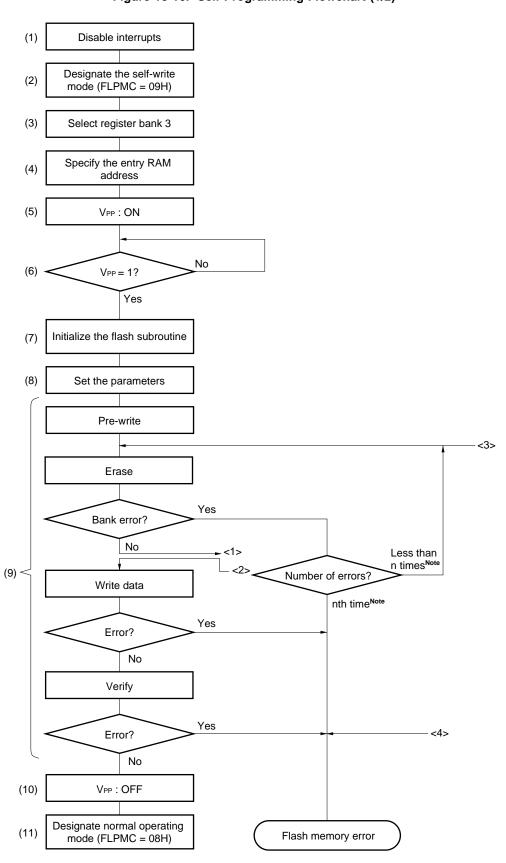

Figure 18-16. Self Programming Flowchart (1/2)

Note Differs depending on the user program.

**Remark** For <1> to <4>, refer to the following flowchart.

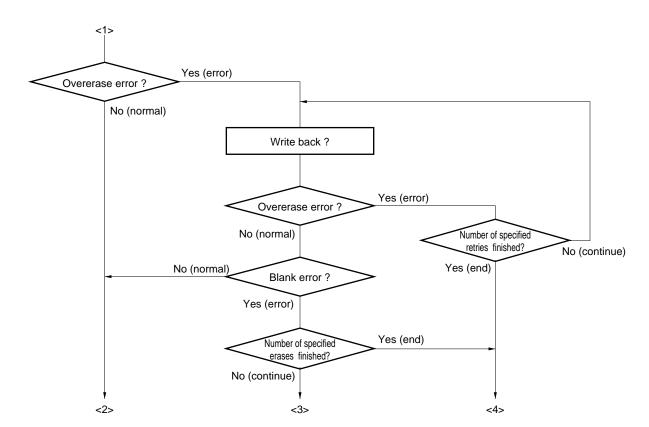

Figure 18-16. Self Programming Flowchart (2/2)

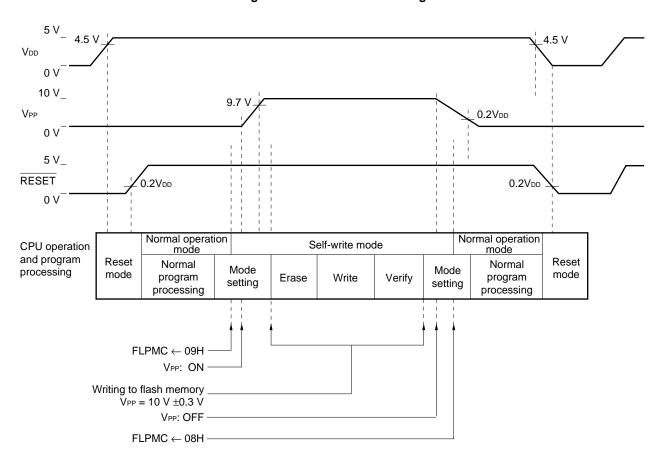

Figure 18-17. Self-Write Timing

#### 18.4.4 CPU resources

The CPU resources used during self write are as follows.

• Register bank: BANK3 (8 bytes)

B register: Status flag C register: Function number

HL register: Entry RAM area starting address

• Stack area: Maximum 16 bytes

• Write data storage area: 1 to 256 bytes

• Entry RAM area: 32 bytes

RAM area used by the self-write subroutines.

Can be specified by the user using the HL register.

· Status flag

| 7             | 6 | 5 | 4            | 3           | 2           | 1           | 0 |
|---------------|---|---|--------------|-------------|-------------|-------------|---|
| Parameter     | _ | _ | Verify error | Write error | Erase error | Blank check | _ |
| setting error |   |   |              |             |             | error       |   |

#### 18.4.5 Entry RAM area

A description of the entry RAM area is shown in Table 18-6.

Table 18-6. Entry RAM Area

| Offset Value | Description  |
|--------------|--|
| +0           | Reserved area (1 byte)                               |
| +1           | Reserved area (1 byte)                               |
| +2 and +3    | Flash memory start address (2 bytes)                 |
| +4 and +5    | Reserved area (2 bytes)                              |
| +6           | No. of bytes written in flash memory (1 byte)        |
| +7           | Write time data (1 byte)                             |
| +8 to +10    | Erase time data (3 bytes)                            |
| +11 to +13   | Writeback time data (3 bytes)                        |
| +14 and +15  | Write data storage buffer starting address (2 bytes) |
| +16 and +17  | Total number of blocks and areas (2 bytes)           |
| +18          | Reserved area (15 bytes)                             |
| :            |  |

Example When the value of the HL register of register bank 3 is 0FD00H

0FD00H: Status

0FD02H: Flash memory start address

0FD06H: Number of bytes written in flash memory

.

The entry RAM area is explained in detail below.

#### (a) Flash memory start address

This is the flash memory address value used by the \_FlashByteWrite subroutine.

#### (b) Number of bytes written in flash memory

Area number and number of bytes written in the flash memory.

#### (c) Write time data

Set the following values according to the operating frequency.

| fx (MHz)     | Setting Value |
|--------------|---------------|
| 1.00 to 1.28 | 20H           |
| 1.29 to 2.56 | 40H           |
| 2.57 to 5.12 | 60H           |
| 5.13 to 8.38 | 80H           |
| 8.39 to 10.0 | A0H           |

#### (d) Erase time data

Setting value = Erase time (s)  $\times$  Operating frequency/29 + 1

(Erase time range: 0.2 to 20 seconds, up to 100 times in 20 seconds are possible, assuming that one erase time is 0.2 seconds)

Example Erase time: 0.2 seconds, operating frequency: 5 MHz

Setting value =  $0.2 \times 5,000,000/512 + 1$ = 1954 (decimal) = 7A2 (hexadecimal)

#### (e) Write data storage buffer starting address

This area contains the starting address of the write data storage buffer area. The RAM data (write data) specified by the address data in this area is written in the flash memory (\_FlashByteWrite subroutine). The data in this area is specified as the starting address and it is possible to specify up to a maximum of 256 bytes of write data.

#### (f) Writeback time

Setting value = Writeback time (s)  $\times$  Operating frequency/ $2^7$  (Up to 30 times in 1.5 seconds are possible, assuming that one writeback time is 0.05 seconds.)

Example Writeback time: 0.05 seconds, operating frequency: 5 MHz

Setting value =  $0.05 \times 5,000,000/128$ = 1953 (decimal) = 7A1 (hexadecimal)

#### 18.4.6 Self-write subroutines

The self-write subroutines and their functions are shown in Table 18-7 below.

Table 18-7. List of Self-Write Subroutines

| Function | Number      | Subroutine Name      | Function  |  |  |  |  |
|----------|-------------|----------------------|---|--|--|--|--|
| Decimal  | Hexadecimal |                      |   |  |  |  |  |
| 0        | 00H         | _FlashEnv            | Initializes the flash subroutine.                   |  |  |  |  |
| 1        | 01H         | _FlashSetEnv         | Sets the parameters.                                |  |  |  |  |
| 2        | 02H         | _FlashGetInfo        | Reads flash information.                            |  |  |  |  |
| 16       | 10H         | _FlashAreaBlankCheck | Performs a blank check of a specified area.         |  |  |  |  |
| 32       | 20H         | _FlashAreaPreWrite   | Performs prewrite for a specified area.             |  |  |  |  |
| 48       | 30H         | _FlashAreaErase      | Erases a specified area.                            |  |  |  |  |
| 54       | 40H         | _FlashAreaWriteBack  | Writes back to a specified area.                    |  |  |  |  |
| 80       | 50H         | _FlashByteWrite      | Writes continuously in byte units.                  |  |  |  |  |

# (1) \_FlashEnv subroutine

#### [Function]

Initializes the flash subroutine.

#### [Argument]

Entry RAM address ..... 2 bytes (HL register)

# [Return value]

None

#### [Register/memory status after called]

Entry RAM address

# [Call example]

```
When the entry RAM address = 0FC30H
```

DΙ

SET1 FLSPM0

LOOP: BF VPP, \$LOOP

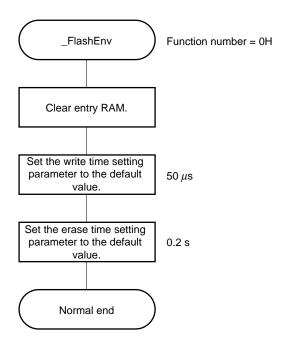

SEL RB3

MOVW HL, #0FC30H ; Entry RAM address

MOV C, #0H ; FlashEnv (function number setting)

CALL !8100H

:

#### (2) \_FlashSetEnv subroutine

#### [Function]

Sets the parameters.

# [Argument]

Write time data: 1 byte (offset value: +7)
Erase time data: 3 bytes (offset value: +8 to 10)

#### [Return value]

Status (B register) 00H: Normal end

80H: Parameter setting error

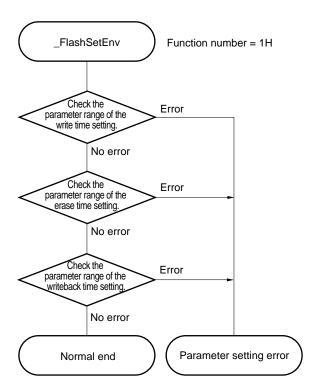

# [Register/memory status after called]

Entry RAM address, write time data, erase time data

#### [Call example]

When the entry RAM address = 0FC30H

```
MOV
         A, #20H
                       ; Write time data
MOV
         !0FC37H, A
MOV
         A, #A2H
                       ; Erase time data
MOV
         !0FC38H, A
                       ; 0.2 s : 0007A2H (at 5 MHz)

         !8100H
```

#### (3) \_FlashGetInfo subroutine

#### [Function]

Reads the flash product identification codes.

```
• \muPD78F0988A signature: 50H
• \muPD78F0988 (old product) signature: 40H
```

#### [Argument]

Flash product identification code: 1 byte (offset value: +6)

# [Return value]

```
Status (B register)
```

00H: Normal end

80H: Option specify error

Product identification code (A register)

# [Register/memory status after called]

Entry RAM starting address

# [Call example]

When the entry RAM address = 0FC30H

```
MOV A, #0H
MOV !0FC36H, A
;

MOV C, #40H ; FlashGetInfo (function number setting)
CALL !8100H
```

#### [Note]

This function enables new products to be distinguished from old products.

#### (4) \_FlashAreaBlankCheck subroutine

#### [Function]

Performs a blank check of a specified area.

## [Argument]

Area number (= 0, 1): 1 byte (offset value: +6)

0: Blank check of area 0000H to 1FFFH (boot area)

1: Blank check of area 2000H to EFFFH

#### [Return value]

Status (B register)

00H: Normal end

02H: Blank check error

80H: Area number specification error

# [Register/memory status after called]

Entry RAM address, area number

# [Call example]

When the entry RAM address = 0FC30H

MOV A, #01H ; Specifies area 2000H to EFFFH

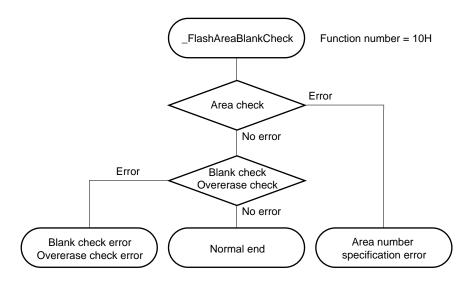

MOV !0FC36H, A

MOV C, #10H ; FlashAreaBlankCheck (function number setting)

CALL !8100H

.

Caution Area 0 (0000H to 1FFFH) is a boot area. Do not specify area 0 as an argument.

#### (5) \_FlashAreaPreWrite subroutine

#### [Function]

Performs prewrite for a specified area (writes 00H to a specified area).

#### [Argument]

Area number (= 0, 1, 2): 1 byte (offset value: +6)
0: Prewrites area 0000H to 1FFFH (boot area)
1: Prewrites area 2000H to EFFFH

#### [Return value]

Status (B register) 00H: Normal end 08H: Write error

80H: Area number specification error

#### [Register/memory status after called]

Entry RAM address, area number

# [Call example]

When the entry RAM address = 0FC30H

MOV A, #1H ; Specifies 2000H to EFFFH

MOV !0FC36H, A

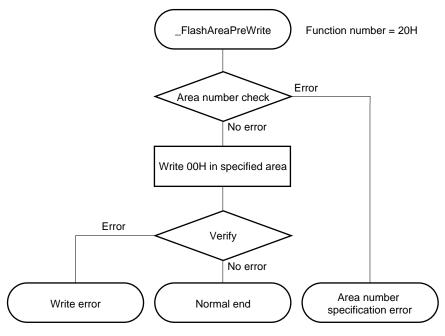

;

MOV C, #20H ; FlashAreaPreWrite (function number setting)

CALL !8100H

:

Caution Area 0 (0000H to 1FFFH) is a boot area. Do not specify area 0 as an argument.

#### (6) \_FlashAreaErase subroutine

#### [Function]

Erases a specified area.

# [Argument]

Area number (= 0, 1): 1 byte (offset value: +6)
0: Erases area 0000H to 1FFFH (boot area)
1: Erases area 2000H to EFFFH

#### [Return value]

Status (B register)
00H: Normal end
02H: Blank check error
04H: Overerase check error
80H: Area number specification error

#### [Register/memory status after called]

Entry RAM address, area number

#### [Call example]

```
When the entry RAM address = 0FC30H

MOV A, #1H ; Specifies 2000H to EFFFH

MOV !0FC36H, A

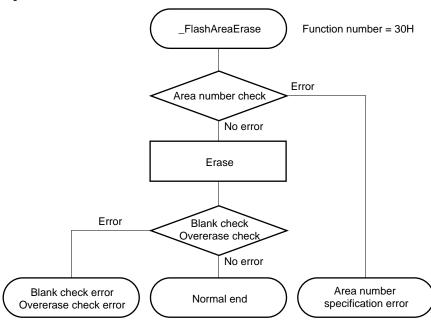

;

MOV C, #30H ; FlashAreaErase (function number setting)

CALL !8100H

:
```

Caution Area 0 (0000H to 1FFFH) is a boot area. Do not specify area 0 as an argument.

#### (7) \_FlashAreaWriteBack subroutine

#### [Function]

Writes back the flash signature codes.

(Writeback is an operation to return a flash area in an overerasure status after erasure to the proper erasure status.)

#### [Argument]

```
Area number (= 0, 1): 1 byte (offset value: +6)
```

# [Return value]

Status (B register)

00H: Normal end02H: Blank check error04H: Overerase check error80H: Write address error

#### [Register/memory status after called]

Entry RAM starting address and area number

#### [Call example]

When the entry RAM address = 0FC30H

```
MOV A, #1H ; Area 1 setting
MOV !0FC36H, A
;

MOV C, #40H ; FlashAreaWriteBack (function number setting)
CALL !8100H
```

#### [Notes]

Set the writeback time to 50 ms/writeback.

Set the number of writebacks to 30 max., assuming 50 ms/writeback.

#### (8) \_FlashByteWrite subroutine

#### [Function]

Writes continuously in byte units.

#### [Argument]

```
Flash memory write start address: 2 bytes (offset value: +2)

Number of bytes Note written in flash memory: 1 byte (offset value: +6)

Write data storage buffer starting address: 2 bytes (offset value: +14)
```

**Note** If 0 is set, it is possible to set a maximum of 256 bytes.

#### [Return value]

Status (B register)
00H: Normal end
08H: Write error
80H: Write address error

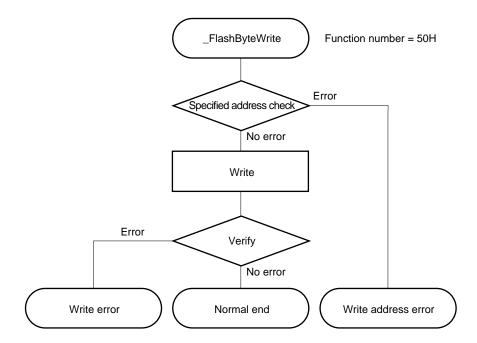

#### [Register/memory status after called]

Entry RAM address, number of bytes written in flash memory

The flash memory write start address is updated to the address at the end of writing.

# [Call example]

```
When the entry RAM address = 0FC30H
      MOVW
               AX, #0FD00H ; Write data storage buffer starting address
      MOVW
               !0FC3EH, AX
      MOVW
               AX, #2000H
                             ; Flash memory write start address
      MOVW
               !0FC32H, AX
      MOV
               A, #0H
                             ; Number of bytes written in flash memory (256 bytes)
      MOV
               !0FC36H, A
      MOV
               C, #50H
                             ; FlashByteWrite (function number setting)
      CALL
               !8100H
```

#### (9) \_FlashArealVerify subroutine

#### [Function]

Performs internal verification of a specified area (reads the flash memory of a specified area in a different mode, and compares it).

#### [Argument]

```
Area number (= 0, 1): 1 byte (offset value: +6)
0: Performs internal verification of area 0000H to 1FFFH (boot area)
1: Performs internal verification of area 2000H to EFFFH
```

#### [Return value]

```
Status (B register)
00H: Normal end
10H: Verify error
80H: Area number specification error
```

#### [Register/memory status after called]

Entry RAM address, area number

#### [Call example]

```
When the entry RAM address = 0FC30H

MOV A, #01H ; Specifies 2000H to EFFFH

MOV !0FC36H, A

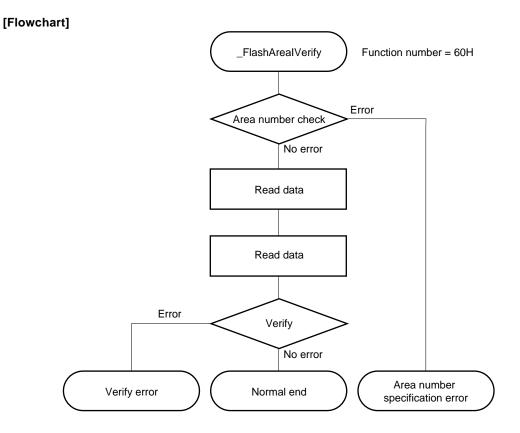

;

MOV C, #60H ; FlashArealVerify (function number setting)

CALL !8100H

.
```

Caution Area 0 (0000H to 1FFFH) is a boot area. Do not specify area 0 as an argument.

# 18.4.7 Self-write circuit configuration

The configuration of the self-write circuit is shown in Figure 18-18.

 $\mu$ PD78F0988A  $V_{DD} = 5 \text{ V} \pm 10\%$   $V_{DD} = 5 \text{ V} \pm 10\%$   $V_{DD} = 9.7 \text{ to } 10.2 \text{ V}$   $V_{DD} = 9.7 \text{ to } 10.2 \text{ V}$   $V_{DD} = 9.7 \text{ to } 10.2 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$   $V_{DD} = 11 \text{ to } 13.5 \text{ V}$ 

Figure 18-18. Self-Write Circuit Configuration

#### **CHAPTER 19 INSTRUCTION SET**

This chapter lists the instruction set of the  $\mu$ PD780988 Subseries. For the details of the operation and machine language (instruction code) of each instruction, refer to **78K/0 Series User's Manual Instructions (U12326E)**.

#### 19.1 Conventions

#### 19.1.1 Operand representation and description formats

In the operand field of each instruction, an operand is described according to the description format for operand representation of that instruction (for details, refer to the assembler specifications). Some operands may be described in two or more description formats. In this case, select one of them. Uppercase characters, #, !, \$, and [] are keywords and must be described as is. The meanings of the symbols are as follows:

• #: Immediate data

· \$: Relative address

• !: Absolute address

• []: Indirect address

When describing immediate data, also describe an appropriate numeric value or label. When describing a label, be sure to describe #, !, \$, or [].

Register description formats r or rp for an operand can be described as a function name (such as X, A, or C) or absolute name (the name in parentheses in the table below, such as R0, R1, or R2).

Table 19-1. Operand Representation and Description Formats

| Representation | Description Format   |
|----------------|--|
| r              | X (R0), A (R1), C (R2), B (R3), E (R4), D (R5), L (R6), H (R7)   |
| rp             | AX (RP0), BC (RP1), DE (RP2), HL (RP3)   |
| sfr            | Special function register symbol <sup>Note</sup>   |
| sfrp           | Special function register symbol (only even address of register that can be manipulated in 16-bit units) <sup>Note</sup> |
| saddr          | FE20H to FF1FH immediate data or label   |
| saddrp         | FE20H to FF1FH immediate data or label (even address only)   |
| addr16         | 0000H to FFFFH immediate data or label   |
|                | (even address only for 16-bit data transfer instruction)   |
| addr11         | 0800H to 0FFFH immediate data or label   |
| addr5          | 0040H to 007FH immediate data or label (even address only)   |
| word           | 16-bit immediate data or label   |
| byte           | 8-bit immediate data or label  |
| bit            | 3-bit immediate data or label  |
| RBn            | RB0 to RB3   |

**Note** FFD0H to FFDFH cannot be addressed.

Remark For the symbols of the special function registers, refer to Table 3-4 Special Function Register List.

#### 19.1.2 Description of operation column

A: A register; 8-bit accumulator

X: X registerB: B registerC: C registerD: D register

E: E register
H: H register
L: L register

AX: AX register pair; 16-bit accumulator

BC: BC register pair
DE: DE register pair
HL: HL register pair
PC: Program counter
SP: Stack pointer

PSW: Program status word

CY: Carry flag

AC: Auxiliary carry flag

Z: Zero flag

RBS: Register bank select flag
IE: Interrupt request enable flag

NMIS: Non-maskable interrupt servicing flag

(): Memory contents indicated by contents of address or register in ()

XH, XL: Higher 8 bits and lower 8 bits of 16-bit register

∴: Logical product (AND)∴: Logical sum (OR)

 $\forall$ : Exclusive logical sum (exclusive OR)

: Inverted data

addr16: 16-bit immediate data or label

jdisp8: Signed 8-bit data (displacement value)

# 19.1.3 Description of flag operation column

(Blank): Not affected 0: Cleared to 0 1: Set to 1

X: Set/cleared according to resultR: Value saved before is restored

# 19.2 Operation List

**Notes 1.** When the internal high-speed RAM area is accessed or when an instruction that does not access data is executed

- 2. When an area other than the internal high-speed RAM area is accessed
- 3. Except r = A

**Remarks 1.** One clock of an instruction is equal to one CPU clock (fcpu) selected by the processor clock control register (PCC).

- 2. The number of clocks shown is when the program is stored in the internal ROM area.
- 3. n indicates the number of wait states when the external memory expansion area is read.
- 4. m indicates the number of wait states when the external memory expansion area is written.

(The notes are explained on the following page.)

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

- **Notes** 1. When writing in the flash memory, be sure to satisfy the following conditions on the VPP voltage supply timing.
  - At rising edge of power supply voltage
     More than 10 μs after V<sub>DD</sub> reaches the lower limit voltage (3.0 V) of the operating voltage range, V<sub>PP</sub> should exceed V<sub>DD</sub> (a in the figure below).
  - At falling edge of power supply voltage More than 10  $\mu$ s after VPP falls below the lower limit voltage (3.0 V) of the VDD operating voltage range, start up VDD (b in the figure below).

2. The rms value should be calculated as follows: [rms value] = [Peak value]  $\times \sqrt{\text{Duty}}$ 

#### Capacitance (TA = 25°C, VDD = Vss = 0 V)

| Parameter         | Symbol |                 | MIN.                          | TYP. | MAX. | Unit |  |
|-------------------|--------|-----------------|-------------------------------|------|------|------|--|
| Input capacitance | Cin    | f = 1 MHz Unme  |                               |      | 15   | pF   |  |
| I/O capacitance   | Сю     | f = 1 MHz       |                               |      | 15   | pF   |  |
|                   |        | Unmeasured pins | to P37, P40 to P47, P50 to    |      |      |      |  |
|                   |        | returned to 0 V | P57, P64 to P67, TO70 to TO75 |      |      |      |  |

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of port pins.

**Notes** 1. In the case of the  $\mu$ PD78F0988A and 78F0988A(A)

- 2. Indicates only oscillator characteristics. Refer to AC Characteristics for instruction execution time.
- 3. Time required to stabilize oscillation after reset or STOP mode release.

Caution When using the system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as Vss1.
- Do not ground the capacitor to a ground pattern through which a high current flows.
- · Do not fetch signals from the oscillator.

#### **Recommended Oscillator Constant**

(1) µPD780982, 780983, 780984, 780986, 780988, 780982(A), 780983(A), 780984(A), 780986(A), 780988(A)

System clock: Ceramic resonator ( $T_A = -40 \text{ to } +85^{\circ}\text{C}$ )

# Caution The oscillator constant is a reference value based on evaluation in specific environments by the resonator manufacturer. If the oscillator characteristics need to be optimized in the actual application, request the resonator manufacturer for evaluation on the implementation circuit. Note that the oscillation voltage and oscillation frequency merely indicate the characteristics of the oscillator. Use the internal operation conditions of the μPD780988 Subseries within the specifications of the DC and AC characteristics.

| width                  |                |                             |   |                      |      |       |      |

Note Selection of  $f_{sam} = f_x$ ,  $f_x/4$ ,  $f_x/32$  is possible with bits 0 and 1 (PRM000, PRM001) of prescaler mode register 00 (PRM00) or with bits 0 and 1 (PRM010, PRM011) of prescaler mode register 01 (PRM01). Note that when selecting TI000 (TM00) or TI001 (TM01) valid edge as the count clock,  $f_{sam} = f_x/16$ .

# Tcy vs VDD (System clock operation)

| Overall erase time per area                | Tera             | When step erase time = 0.2 s <b>Note 2</b>                        |       |      | 20    | s/area                              |
| Writeback time                             | Twb              | Note 3  | 49.4  | 50   | 50.6  | ms                                  |
| Number of writebacks per writeback command | Cwb              | When writeback time = 50 ms Note 4                                |       |      | 60    | Times/<br>write-<br>back<br>command |
| Number of erase/<br>writebacks             | Cerwb            |   |       |      | 16    | Times                               |
| Step write time                            | Twr              | Note 5  | 48    | 50   | 52    | μs                                  |
| Overall write time per word                | Twrw             | When step write time = 50 $\mu$ s (1 word = 1 byte) <b>Note 6</b> | 48    |      | 520   | μs/<br>word                         |
| Number of rewrites per area                | Cerwr            | 1 erase + 1 write after erase = 1 rewrite Note 7                  |       | 20   |       | Times/<br>area                      |

### **Notes 1.** The recommended setting value for the step erase time is 0.2 s.

- 2. The prewrite time before erasure and the erase verify time (writeback time) is not included.
- 3. The recommended setting value for the writeback time is 50 ms.
- 4. Writeback is executed once by the issuance of the writeback command. Therefore, the number of retries must be the maximum value minus the number of commands issued.
- **5.** Recommended step write time setting value is 50  $\mu$ s.
- 6. The actual write time per word is 100  $\mu$ s longer. The internal verify time during or after a write is not included.
- 7. When a product is first written after shipment, "erase  $\rightarrow$  write" and "write only" are both taken as one rewrite.

Example: P: Write, E: Erase

Shipped product →  $P \rightarrow E \rightarrow P \rightarrow E \rightarrow P$ : 3 rewrites

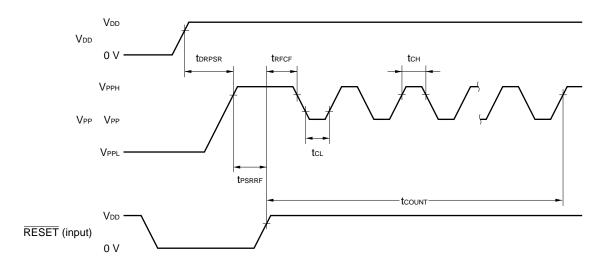

Shipped product  $\rightarrow$  E  $\rightarrow$  P  $\rightarrow$  E  $\rightarrow$  P  $\rightarrow$  E  $\rightarrow$  P: 3 rewrites

- Remarks 1. The range of the operating clock during flash memory programming is not the same as the range during normal operation.
  - 2. When using the PG-FP3, FL-PR3 (made by Naito Densei), PG-FP4, or FL-PR4 (made by Naito Densei) the time parameters that need to be downloaded from the parameter files for write/erase are automatically set. Unless otherwise directed, do not change the set values.

# (2) Serial write operation characteristics

(The notes are explained on the following page.)

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

- **Notes** 1. When writing in the flash memory, be sure to satisfy the following conditions on the VPP voltage supply timing.
  - At rising edge of power supply voltage
     More than 10 μs after V<sub>DD</sub> reaches the lower limit voltage (4.0 V) of the operating voltage range, V<sub>PP</sub> should exceed V<sub>DD</sub> (a in the figure below).
  - At falling edge of power supply voltage More than 10  $\mu$ s after VPP falls below the lower limit voltage (4.0 V) of the VDD operating voltage range, start up VDD (b in the figure below).

2. The rms value should be calculated as follows: [rms value] = [Peak value]  $\times \sqrt{\text{Duty}}$ 

### Capacitance ( $T_A = 25^{\circ}C$ , $V_{DD} = V_{SS} = 0 V$ )

| Parameter         | Symbol |                 | Conditions                              |  |  | MAX. | Unit |
|-------------------|--------|-----------------|---|--|--|------|------|

**Notes** 1. In the case of the  $\mu$ PD78F0988A and 78F0988A(A)

- 2. Indicates only oscillator characteristics. Refer to AC Characteristics for instruction execution time.
- 3. Time required to stabilize oscillation after reset or STOP mode release.

Caution When using the system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as Vss1.
- Do not ground the capacitor to a ground pattern through which a high current flows.
- · Do not fetch signals from the oscillator.

### **Recommended Oscillator Constant**

Caution The oscillator constant is a reference value based on evaluation in specific environments by the resonator manufacturer. If the oscillator characteristics need to be optimized in the actual application, request the resonator manufacturer for evaluation on the implementation circuit. Note that the oscillation voltage and oscillation frequency merely indicate the characteristics of the oscillator. Use the internal operation conditions of the μPD780988 Subseries within the specifications of the DC and AC characteristics.

## **Remarks** 1. tcy = Tcy/4

- 2. n indicates the number of waits.
- 3.  $C_L = 100 \text{ pF}$  ( $C_L$  is the load capacitance of the AD0 to AD7,  $\overline{RD}$ ,  $\overline{WR}$ ,  $\overline{WAIT}$ , and ASTB pins.)

Caution Tcy can only be used when the MIN. value is 0.238  $\mu$ s.

## (3) Serial interface ( $T_A = -40 \text{ to } +85^{\circ}\text{C}$ , $V_{DD} = 4.0 \text{ to } 5.5 \text{ V}$ )

## (a) 3-wire serial I/O mode (SCK... Internal clock output)

| Number of erase/<br>writebacks                | Cerwb            |   |       |      | 16    | Times                               |
| Step write time                               | Twr              | Note 5  | 48    | 50   | 52    | μs                                  |
| Overall write time per word                   | Twrw             | When step write time = 50 $\mu$ s (1 word = 1 byte) <b>Note 6</b> | 48    |      | 520   | μs/<br>word                         |
| Number of rewrites per area                   | Cerwr            | 1 erase + 1 write after erase = 1 rewrite Note 7                  |       | 20   |       | Times/<br>area                      |

**Notes 1.** The recommended setting value for the step erase time is 0.2 s.

- 2. The prewrite time before erasure and the erase verify time (writeback time) is not included.
- 3. The recommended setting value for the writeback time is 50 ms.
- **4.** Writeback is executed once by the issuance of the writeback command. Therefore, the number of retries must be the maximum value minus the number of commands issued.
- **5.** Recommended step write time setting value is 50  $\mu$ s.
- **6.** The actual write time per word is 100  $\mu$ s longer. The internal verify time during or after a write is not included.
- 7. When a product is first written after shipment, "erase → write" and "write only" are both taken as one rewrite.
  Example: P: Write, E: Erase

```
Shipped product \rightarrow P \rightarrow E \rightarrow P \rightarrow E \rightarrow P: 3 rewrites
Shipped product \rightarrow E \rightarrow P \rightarrow E \rightarrow P \rightarrow E \rightarrow P: 3 rewrites
```

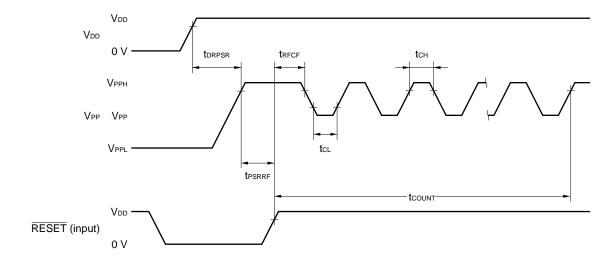

**Remarks 1.** The range of the operating clock during flash memory programming is the same as the range during normal operation.

2. When using the PG-FP3, FL-PR3 (made by Naito Densei), PG-FP4, or FL-PR4 (made by Naito Densei) the time parameters that need to be downloaded from the parameter files for write/erase are automatically set. Unless otherwise directed, do not change the set values.

# (2) Serial write operation characteristics

P64GC-80-AB8-5

# 64-PIN PLASTIC LQFP (14x14)

#### NOTE

Each lead centerline is located within 0.20 mm of its true position (T.P.) at maximum material condition.

#### **CHAPTER 23 RECOMMENDED SOLDERING CONDITIONS**

This product should be soldered and mounted under the following recommended conditions.

For soldering methods and conditions other than those recommended below, contact an NEC sales representative.

For details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**.

Table 23-1. Surface Mounting Type Soldering Conditions (1/2)

64-pin plastic QFP (14  $\times$  14) (1)  $\mu$ PD780982GC-xxx-AB8: **μPD780983GC-xxx-AB8:** 64-pin plastic QFP (14  $\times$  14) **μPD780984GC-xxx-AB8:** 64-pin plastic QFP (14  $\times$  14) 64-pin plastic QFP (14  $\times$  14) μPD780986GC-xxx-AB8: 64-pin plastic QFP (14  $\times$  14) **μPD780988GC-xxx-AB8:**  $\mu$ PD780982GC(A)-xxx-AB8: 64-pin plastic QFP (14 × 14)  $\mu$ PD780983GC(A)-xxx-AB8: 64-pin plastic QFP (14 × 14)  $\mu$ PD780984GC(A)-xxx-AB8: 64-pin plastic QFP (14 × 14)  $\mu$ PD780986GC(A)-xxx-AB8: 64-pin plastic QFP (14 × 14)  $\mu$ PD780988GC(A)-xxx-AB8: 64-pin plastic QFP (14 × 14) **μPD78F0988AGC-AB8**: 64-pin plastic QFP ( $14 \times 14$ )

| Soldering Method   | Soldering Conditions   | Recommended<br>Condition Symbol |
|--|--|---------------------------------|
| Infrared reflow  | ared reflow Package peak temperature: 235°C, Time: 30 seconds max.  (at 210°C or higher), Count: Three times or less |                                 |
| VPS  | Package peak temperature: 215°C, Time: 40 seconds max.  (at 200°C or higher), Count: Three times or less             |                                 |
| Wave soldering  Solder bath temperature: 260°C max., Time: 10 seconds max.,  Count: Once, Preheating temperature: 120°C max. (package surface temperature) |  | WS60-00-1                       |
| Partial heating Pin temperature: 300°C max., Time: 3 seconds max. (per pin row)  |  |                                 |

Caution Do not use different soldering methods together (except for partial heating).

| Soldering Method | Soldering Conditions  | Recommended Condition Symbol |
|------------------|---|------------------------------|
| Infrared reflow  | Package peak temperature: 235°C, Time: 30 seconds max. (at 210°C or higher), Count: Two times or less                                     | IR35-00-2                    |
| VPS              | Package peak temperature: 215°C, Time: 40 seconds max. (at 200°C or higher), Count: Two times or less                                     | VP15-00-2                    |
| Wave soldering   | Solder bath temperature: 260°C max., Time: 10 seconds max., Count: Once, Preheating temperature: 120°C max. (package surface temperature) | WS60-00-1                    |
| Partial heating  | Pin temperature: 300°C max., Time: 3 seconds max. (per pin row)   | _                            |

Caution Do not use different soldering methods together (except for partial heating).

Table 23-2. Insertion Type Soldering Conditions

 $\mu$ PD780983CW-xxx: 64-pin plastic SDIP (19.05 mm (750))  $\mu$ PD780983CW-xxx: 64-pin plastic SDIP (19.05 mm (750))  $\mu$ PD780984CW-xxx: 64-pin plastic SDIP (19.05 mm (750))  $\mu$ PD780986CW-xxx: 64-pin plastic SDIP (19.05 mm (750))  $\mu$ PD780988CW-xxx: 64-pin plastic SDIP (19.05 mm (750))  $\mu$ PD78F0988ACW: 64-pin plastic SDIP (19.05 mm (750))

| Soldering Method               | Soldering Condition   |
|--------------------------------|---|
| Wave soldering (only for pins) | Solder bath temperature: 260°C max., Time: 10 seconds max.      |
| Partial heating                | Pin temperature: 300°C max., Time: 3 seconds max. (per pin row) |

Caution Apply wave soldering only to the pins and be careful not to bring solder into direct contact with the package.

#### APPENDIX A DEVELOPMENT TOOLS

The following development tools are available for the development of systems which employ the  $\mu$ PD780988 Subseries. Figure A-1 shows the configuration example of the tools.

#### • Support for PC98-NX series

Unless otherwise specified, products supported by IBM PC/AT<sup>TM</sup> compatibles can be used for PC98-NX series computers. When using PC98-NX series computers, refer to the description for IBM PC/AT compatibles.

#### Windows

Unless otherwise specified, "Windows" means the following OSs.

- Windows 3.1
- Windows 95
- Windows 98
- Windows 2000
- Windows NT<sup>TM</sup> Ver. 4.0

- - Software package - Software package Debugging software Language processing software Assembler package • Integrated debugger C compiler package System simulator • Device file • C library source fileNote 1 Control software Project manager (Windows only)<sup>Note 2</sup> Embedded software • Real-time OS Host machine (PC or EWS) Interface adapter, PC card interface, etc. Power supply unit Flash memory In-circuit emulator write environment **Emulation board** Flash programmer Flash memory I/O board write adapter Performance board Flash memory Emulation probe

Figure A-1. Configuration of Development Tools

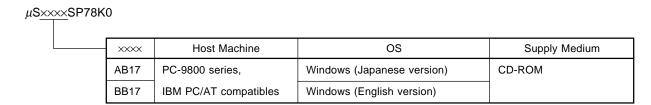

- **Notes 1.** The C library source file is not included in the software package.
  - **2.** The project manager is included in the assembler package. The project manager is only used for Windows.

Conversion socket or conversion adapter

Target system

#### A.1 Software Package

| SP78K0           | This package contains various software tools for 78K/0 Series development. |
|------------------|--|
| Software package | The following tools are included.  |
|                  | RA78K0, CC78K0, ID78K0-NS, SM78K0, and various device files                |
|                  | Part Number: μSxxxxSP78K0  |

# A.2 Language Processing Software

| RA78K0<br>Assembler package                      | This assembler converts programs written in mnemonics into object codes executable with a microcontroller.  Further, this assembler is provided with functions capable of automatically creating symbol tables and branch instruction optimization.  This assembler should be used in combination with an optional device file (DF780988).  Precaution when using RA78K0 in PC environment> This assembler package is a DOS-based application. It can also be used in Windows, however, by using the Project Manager (included in assembler package) on Windows. |
|--|--|
|  | Part Number: μSxxxRA78K0   |
| CC78K0<br>C compiler package                     | This compiler converts programs written in C language into object codes executable with a microcontroller.  This compiler should be used in combination with an optional assembler package and   |
|  | device file.   |
|  | <pre> <pre> <pre> </pre> This C compiler package is a DOS-based application. It can also be used in Windows, however, by using the Project Manager (included in assembler package) on Windows.</pre></pre>   |
|  | Part Number: μS××××CC78K0  |
| DF780988Note 1 Device file                       | This file contains information peculiar to the device.  This device file should be used in combination with an optional tool (RA78K0, CC78K0, SM78K0, ID78K0-NS, ID78K0, and RX78K0).  Corresponding OS and host machine differ depending on the tool used.  |
|  | Part Number: μSxxxxDF780988  |
| CC78K0-L <sup>Note 2</sup> C library source file | This is a source file of functions configuring the object library included in the C compiler package.  This file is required to match the object library included in C compiler package to the user's specifications.  It does not depend on the operating environment because it is a source file.  |
|  | Part Number: μSxxxxCC78K0-L  |

**Notes 1.** The DF780988 can be used in common with the RA78K0, CC78K0, SM78K0, ID78K0-NS, ID78K0, and RX78K0.

2. CC78K0-L is not included in the software package (SP78K0).

**Remark** ×××× in the part number differs depending on the host machine and OS used.

#### \* A.3 Control Software

| Project manager | This is control software designed to enable efficient user program development in the       |
|-----------------|---|
|                 | Windows environment. All operations used in development of a user program, such as          |
|                 | starting the editor, building, and starting the debugger, can be performed from the project |
|                 | manager.  |
|                 | <caution></caution>   |
|                 | The project manager is included in the assembler package (RA78K0).                          |
|                 | It can only be used in Windows.   |

#### **★ A.4 Flash Memory Writing Tools**

| Flashpro III (Part number: FL-PR3, PG-FP3) Flashpro IV (Part number: FL-PR4, PG-FP4) Flash programmer | Flash programmer dedicated to microcontrollers with on-chip flash memory.    |
|---|--|
| FA-64CW   | Flash memory writing adapter used connected to the Flashpro III/Flashpro IV. |
| FA-64GC   | • FA-64CW: 64-pin plastic SDIP (CW type)                                     |
| FA-64GC-8BS-A   | FA64-GC: 64-pin plastic QFP (GC-AB8 type)                                    |
| Flash memory writing adapter  | FA-64GC-8BS-A: 64-pin plastic LQFP (GC-8BS type)                             |

**Remark** FL-PR3, FL-PR4, FA-64CW, FA-64GC, and FA-64GC-8BS-A are products of Naito Densei Machida Mfg. Co., Ltd.

Contact: +81-45-475-4191 Naito Densei Machida Mfg. Co., Ltd.

#### A.5 Debugging Tools (Hardware)

#### ★ A.5.1 When using the in-circuit emulator IE-78K0-NS or IE-78K0-NS-A

| IE-78K0-NS<br>In-circuit emulator                                   |                | The in-circuit emulator serves to debug hardware and software when developing application systems using a 78K/0 Series product. It is supported by the integrated debugger (ID78K0-NS). This emulator should be used in combination with a power supply unit, emulation probe, and interface adapter, which is required to connect this emulator to the host machine. |
|---|----------------|---|
| IE-78K0-NS-PA<br>Performance box                                    | ard            | This board is used to enhance the functions of the IE-78K0-NS. By connecting this board to the IE-78K0-NS-PA before use, debugging functions, such as coverage function addition and the enhancement of tracer and timer functions, are enhanced.   |
| IE-78K0-NS-A<br>In-circuit emulate                                  | or             | In-circuit emulator that combines IE-78K0-NS and IE-78K0-NS-PA  |
| IE-70000-MC-PS<br>Power supply ur                                   | · <del>-</del> | This adapter is used for supplying power from a receptacle of 100 V to 240 V AC.  |
| IE-70000-98-IF-0<br>Interface adapte                                |                | This adapter is required when using a PC-9800 Series computer (except notebook type) as the host machine (C bus supported).   |
| IE-70000-CD-IF-<br>PC card interfac                                 |                | This PC card and interface cable are required when using a notebook-type computer as the host machine (PCMCIA socket supported).  |
| IE-70000-PC-IF-<br>Interface adapte                                 |                | This adapter is required when using an IBM PC/AT or compatible computer as the host machine (ISA bus supported).  |
| IE-70000-PCI-IF<br>Interface adapte                                 |                | This adapter is required when using a PCI bus integrated computer as the host machine.  |
| IE-780988-NS-E<br>Emulation board                                   |                | This board emulates the operations of the peripheral hardware peculiar to a device. It should be used in combination with an in-circuit emulator and IE-78K0-NS-P01.  |
| IE-78K0-NS-P01<br>I/O board   |                | This board is used in combination with the IE-780988-NS-EM4 and IE-78K0-NS to perform emulation.  |
| NP-64CW<br>Emulation probe  |                | This probe is used to connect the in-circuit emulator to the target system and is designed for a 64-pin plastic SDIP (CW type).   |
| NP-64GC-TQ<br>NP-H64GC-TQ   |                | This probe is used to connect the in-circuit emulator to the target system and is designed for a 64-pin plastic QFP (GC-AB8 type) and 64-pin plastic LQFP (GC-8BS type).  |
| Emulation TGC-064SAP probe Conversion adapter (Refer to Figure A-4) |                | This conversion adapter connects the NP-64GC-TQ and NP-H64GC-TQ to the target system board designed to mount a 64-pin plastic QFP (GC-AB8 type) and 64-pin plastic LQFP (GC-8BS type).  |

**Remarks 1.** NP-64CW, NP-64GC, NP-64GC-TQ, and NP-H64GC-TQ are products of Naito Densei Machida Mfg. Co., Ltd.

For further information, contact Naito Densei Machida Mfg. Co., Ltd. (+81-45-475-4191)

2. TGC-064SAP is a product made by TOKYO ELETECH CORPORATION.

For further information, contact Daimaru Kogyo Co., Ltd.

Tokyo Electronics Department (+81-3-3820-7112)

Osaka Electronics Department (+81-6-6244-6672)

**3.** The TGC-064SAP is sold in single units.

## A.5.2 When using the in-circuit emulator IE-78001-R-A

| _ |  |                             |   |
|---|--|-----------------------------|---|
|   | IE-78001-R-A In-circuit emulator  IE-70000-98-IF-C Interface adapter                         |                             | The in-circuit emulator serves to debug hardware and software when developing application systems using a 78K/0 Series product. It is supported by the integrated debugger (ID78K0). This emulator should be used in combination with an emulation probe and interface adapter, which is required to connect this emulator to the host machine. |
|   |  |                             | This adapter is required when using a PC-9800 Series computer (except notebook type) as the IE-78001-R-A host machine (C bus supported).  |
|   | IE-70000-PC-IF-<br>Interface adapte  |                             | This adapter is required when using an IBM PC/AT or compatible computer as the IE-78001-R-A host machine (ISA bus supported).   |
| * | IE-70000-PCI-IF-<br>Interface adapte   |                             | This adapter is required when using a PCI bus integrated computer as the IE-78001-R-A host machine.   |
|   | IE-78000-R-SV3<br>Interface adapter  |                             | This is the adapter and cable required when using an EWS computer as the IE-78001-R-A host machine, and is used connected to the board in the IE-78001-R-A. 10Base-5 is supported for Ethernet <sup>TM</sup> . For other methods, a commercially available conversion adapter is required.  |
|   | IE-780988-NS-EM4<br>Emulation board  |                             | This board emulates the operations of the peripheral hardware peculiar to a device. It should be used in combination with an in-circuit emulator, IE-78K0-NS-P01, and IE-78K0-R-EX1.  |
|   |  | IE-78K0-NS-P01<br>I/O board | This board is used in combination with the IE-780988-NS-EM4 and IE-78K0-NS to perform emulation.  |
|   | IE-78K0-R-EX1<br>Emulation probe   | conversion board            | This board is required when using the IE-780988-NS-EM4 and IE-78K0-NS-P01 on the IE-78001-R-A.  |
|   | EP-78240CW-R<br>Emulation probe  |                             | This probe is used to connect the in-circuit emulator to the target system and is designed for a 64-pin plastic SDIP (CW type).   |
|   | EP-78240GC-R<br>Emulation probe  |                             | This probe is used to connect the in-circuit emulator to the target system and is designed for a 64-pin plastic QFP (GC-AB8 type).  |
|   | EV-9200GC-64<br>Conversion socket<br>(Refer to <b>Figures</b><br><b>A-2</b> and <b>A-3</b> ) |                             | This conversion socket connects the EP-78240GC-R to the target system board designed to mount a 64-pin plastic QFP (GC-AB8 type).   |

**Remark** The EV-9200GC-64 is sold in packages of 5 units.

# A.6 Debugging Tools (Software)

| SM78K0  | This is a system simulator for the 78K/0 Series. The SM78K0 is Windows-based   |  |
|---|--|--|
| System simulator  | software.  |  |
|   | It is used to perform debugging at the C source level or assembler level while simulating the operation of the target system on a host machine.  Use of the SM78K0 allows the execution of application logical testing and performance testing on an independent basis from hardware development, thereby providing higher development efficiency and software quality.  The SM78K0 should be used in combination with the device file (DF780988) (sold separately). |  |
|   | Part Number: μS××××SM78K0  |  |
| ID78K0-NS Integrated debugger (supporting in-circuit emulators IE-78K0-NS and IE-78K0-NS-A) | This debugger supports the in-circuit emulators for the 78K/0 Series. The ID78K0-NS is Windows-based software. It has improved C-compatible debugging functions and can display the results of tracing with the source program using an integrating window function that associates  |  |
| ID78K0 Integrated debugger (supporting in-circuit emulator                                  | the source program, disassemble display, and memory display with the trace result.  It should be used in combination with the device file (DF780988) (sold separately).  |  |
| IE-78001-R-A)   | Part Number: μSxxxxID78K0-NS, μSxxxxID78K0   |  |

#### A.8 Upgrading from Former In-Circuit Emulator for 78K/0 Series to IE-78001-R-A

If you already have a former in-circuit emulator for 78K/0 Series microcontrollers (IE-78000-R or IE-78000-R-A), that in-circuit emulator can operate as equivalent to the IE-78001-R-A by replacing its internal break board with the IE-78001-R-BK.

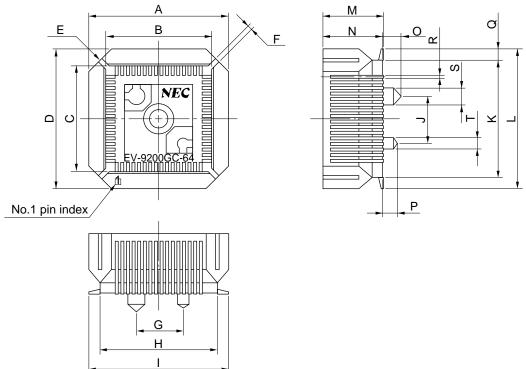

Table A-1. Upgrading from Former In-Circuit Emulator for 78K/0 Series to IE-78001-R-A

| In-Circuit Emulator Owned | In-Circuit Emulator Cabinet System UpgradeNote | Board to Be Purchased |
|---------------------------|--|-----------------------|
| IE-78000-R                | Required                                       | IE-78001-R-BK         |
| IE-78000-R-A              | Not required                                   |                       |

Note To replace the cabinet, send your in-circuit emulator to NEC.

#### APPENDIX D REVISION HISTORY

A history of the revisions up to this edition is shown below. "Applied to:" indicates the chapters to which the revision was applied.

(1/6)

| Edition | Contents   | Applied to:                               |
|---------|--|---|
| 3rd     | Change of status from "under development" to "development completed" for the following products μPD780982, 780983, and 780984  | Throughout                                |
|         | 1.4 Pin Configuration (Top View)     Deletion of Cautions for AV <sub>DD</sub> and AV <sub>SS</sub> connections  | CHAPTER 1<br>GENERAL                      |
|         | <ul> <li>2.1 List of Pin Functions (2) Non-port pins</li> <li>Modification of descriptions for TI000, TI001, AV<sub>DD</sub>, AV<sub>SS</sub> pins</li> <li>2.2.5 P40 to P47 (Port 4) Modification of description for (2) Control mode</li> <li>Addition of I/O circuit type description to Table 2-1 Types of Pin I/O Circuits</li> <li>Addition of Figure 2-1 Pin I/O Circuit</li> </ul>   | CHAPTER 2<br>PIN FUNCTIONS                |
|         | Modification of description for TMC50, TMC51, TMC52 in <b>Table 3-4 Special Function Register List</b>   | CHAPTER 3 CPU ARCHITECTURE                |
|         | 4.3 Registers Controlling Port Functions  Addition of Caution to (1) Port mode registers (PM0, PM2, PM3, PM4, PM5, PM6)  Addition of Caution to (2) Pull-up resistor option registers (PU0, PU2, PU3, PU4, PU5, PU6)  Modification of Figure 4-11 Format of Pull-Up Resistor Option Register   | CHAPTER 4 PORT FUNCTIONS                  |
|         | 6.3 Configuration of 16-Bit Timer/Event Counter Modification of Table 6-3 Tl00n Pin Valid Edge and CR00n, CR01n Capture Triggers Modification of Caution in (3) 16-bit capture/compare register 010, 011 (CR010, CR011) Addition of Caution to Figure 6-5 Format of Capture/Compare Control Register 00 Addition of Caution to Figure 6-6 Format of Capture/Compare Control Register 01 Addition of Cautions to Figure 6-7 Format of Timer Output Control Register 00 Addition of Cautions to Figure 6-8 Format of Timer Output Control Register 01 Addition of Note to Figure 6-9 Format of Prescaler Mode Register 00 Addition of Note to Figure 6-10 Format of Prescaler Mode Register 01 Modification of Figure 6-13 Interval Timer Configuration Diagram Modification of description in 6.5.4 External event counter operation Modification of Figure 6-27 External Event Counter Configuration Diagram 6.6 Notes on 16-Bit Timer/Event Counter Addition of description to (6) One-shot pulse output Addition of description to (10) Capture operation Addition of description to (12) Edge detection | CHAPTER 6 16-BIT TIMER/EVENT COUNTER      |
|         | 7.2 Configuration of 8-Bit Timer/Event Counter  Modification of (2) 8-bit compare registers 50, 51, and 52 (CR50, CR51, and CR52)  7.3 Registers Controlling 8-Bit Timer/Event Counter  Modification of (1) 8-bit timer mode control registers 50, 51, and 52 (TMC50, TMC51, and TMC52)  Modification of Figure 7-4 Format of 8-Bit Timer Mode Control Register 50  Modification of Figure 7-5 Format of 8-Bit Timer Mode Control Register 51  Modification of Figure 7-6 Format of 8-Bit Timer Mode Control Register 52   | CHAPTER 7<br>8-BIT TIMER/EVENT<br>COUNTER |

(2/6)

| Edition | Contents  | Applied to:  |
|---------|---|--|
| 3rd     | 8.4 Operation of 10-Bit Inverter Control Timer  Modification of Caution in (2) Output waveform widths corresponding to set values  Modification of Figure 8-6 TM7 Operation Timing (CMn(BFCMn) = 000H)  | CHAPTER 8<br>10-BIT INVERTER<br>CONTROL TIMER      |
|         | Modification of Table 10-5 Real-Time Output Port Operating Mode and Output Trigger  | CHAPTER 10<br>REAL-TIME OUTPUT<br>PORT             |
|         | Modification of Figure 11-10 A/D Conversion End Interrupt Request Generation Timing   | CHAPTER 11<br>A/D CONVERTER                        |
|         | Addition of Figure 12-2 Block Diagram of UART00 Baud Rate Generator Addition of Figure 12-4 Block Diagram of UART01 Baud Rate Generator   | CHAPTER 12<br>SERIAL INTERFACE<br>(UART00, UART01) |
|         | 13.2 Configuration of Serial Interface  Modification of (1) Serial I/O shift register 3 (SIO3)  | CHAPTER 13<br>SERIAL INTERFACE<br>(SIO3)           |
|         | Modification of Table 17-1 Status of Each Hardware After Reset  | CHAPTER 17<br>RESET FUNCTION                       |
|         | Modification of Figure 18-4 Flashpro II/III Connection Using 3-Wire Serial I/O Modification of Figure 18-5 Flashpro II/III Connection in UART Mode Modification of Figure 18-6 Flashpro II/III Connection Using Pseudo 3-Wire Serial I/O  | CHAPTER 18<br>μPD78F0988                           |
|         | Modification of Figure A-1 Development Tool Configuration  A.1 Language Processing Software  • Change in the status of device file DF780988 from "under development" to "development completed"  A.3.1 Hardware   | APPENDIX A DEVELOPMENT TOOLS                       |
|         | Addition of the following products     Performance board IE-78K0-NS-PA (under development)     Emulation probe NP-64GC-TQ (development completed)     Conversion adapter TGC-064SAP (development completed)      Change in the status of the following products from "under development" to "development completed"  PC card interface IE-70000-CD-IF-A   |  |
|         | Interface adapter IE-70000-PCI-IF Addition of Conversion Adapter (TGC-064SAP) Package Drawing   |  |
| 4th     | Addition of the following products to the target products $\mu$ PD780982(A), 780983(A), 780984(A), 780986(A), 780988(A) Change of part number $\mu$ PD780982(A)GC-xxx-AB8 $\rightarrow \mu$ PD780982GC(A)-xxx-AB8 $\mu$ PD780983(A)GC-xxx-AB8 $\rightarrow \mu$ PD780983GC(A)-xxx-AB8 $\mu$ PD780984(A)GC-xxx-AB8 $\rightarrow \mu$ PD780984GC(A)-xxx-AB8 $\mu$ PD780986(A)GC-xxx-AB8 $\rightarrow \mu$ PD780986GC(A)-xxx-AB8 $\mu$ PD780988(A)GC-xxx-AB8 $\rightarrow \mu$ PD780988GC(A)-xxx-AB8 | Throughout   |
|         | 64-pin plastic shrink DIP (750 mil) → 64-pin plastic SDIP (19.05 mm (750))  Modification of bit names and addition of Caution to Figure 10-6 Format of Real- Time Output Port Mode Register 1   | CHAPTER 10 REAL-<br>TIME OUTPUT PORT               |
|         | Addition of 11.6 How to Read A/D Converter Characteristics Tables   | CHAPTER 11 A/D CONVERTER                           |

(3/6)

| Edition | Contents   | (3/6<br>Applied to:                           |
|---------|--|---|
| 4th     | Addition of Figure 12-11 Baud Rate Allowance Error Including Sampling Error (When k = 0) Addition of ASISOn value description to Table 12-5 Receive Error Causes   | CHAPTER 12 SERIAL INTERFACE (UART00, UART01)  |
|         | Addition of Remark to 14.2 Interrupt Sources and Configuration  Addition of Caution to Figure 14-3 Format of Interrupt Mask Flag Register  Addition of Caution to Figure 14-4 Format of Priority Specification Flag Register | CHAPTER 14 INTERRUPT FUNCTIONS                |
|         | Addition of Caution to Figure 15-3 Format of Memory Expansion Wait Setting Register  | CHAPTER 15 EXTERNAL DEVICE EXPANSION FUNCTION |
|         | Addition of Caution to 18.3.1 Selecting communication mode   | CHAPTER 18<br>μPD78F0988                      |
|         | A.3.1 Hardware (1) When using the in-circuit emulator IE-78K0-NS:     Change in the status of IE-78K0-NS-PA from "under development" to "development completed"  | APPENDIX A DEVELOPMENT TOOLS                  |
| 5th     | Deletion of one-shot pulse output from 16-bit timer/event counter function   | CHAPTER 6<br>16-BIT TIMER/EVENT<br>COUNTER    |
|         | Modification of Figure 11-17 Differential Linearity Error  | CHAPTER 11<br>A/D CONVERTER                   |
| 6th     | Change of flash memory product from μPD78F0988 to μPD78F0988A, 78F0988A(A)   | Throughout                                    |
|         | Change of INTTM01n timing in Figure 6-18 Timing of Pulse Width Measurement Operation with Free-Running Counter and One Capture Register (with Both Edges Specified)  | CHAPTER 6 16-BIT<br>TIMER/EVENT<br>COUNTER    |
|         | Change of INTTM01n timing in Figure 6-20 CR01n Capture Operation with Rising Edge Specified  |   |
|         | Change of INTTM00n and INTTM01n timing in Figure 6-21 Timing of Pulse Width Measurement Operation with Free-Running Counter (with Both Edges Specified)  |   |
|         | Change of INTTM01n timing in Figure 6-23 Timing of Pulse Width Measurement Operation by Free-Running Counter and Two Capture Registers (with Rising Edge Specified)  |   |
|         | Change of INTTM01n timing in Figure 6-25 Timing of Pulse Width Measurement Operation by Means of Restart (with Rising Edge Specified)  |   |
|         | Change of CR01n interrupt value timing in Figure 6-33 Capture Register  Data Retention Timing  |   |
|         | Change of INTTM00n timing in Figure 6-34 Operation Timing of OVF0n Flag  |   |
|         | Addition of (11) to (14) to 11.5 Notes on A/D Converter  | CHAPTER 11 A/D<br>CONVERTER                   |
|         | Addition of Caution to Figure 14-2 Format of Interrupt Request Flag Registers  | CHAPTER 14<br>INTERRUPT<br>FUNCTIONS          |
|         | Addition of 18.3 Characteristics of Flash Memory   | CHAPTER 18                                    |
|         | Addition of "3-wire serial I/O + HS" to <b>Table 18-4 Communication Modes</b>  | μPD78F0988A                                   |
|         | Addition of "Writeback" to Table 18-5 Major Functions of Flash Memory Programming  |   |

(4/6)

| Edition | Contents   | Applied to:                   |
|---------|--|-------------------------------|
| 6th     | Addition of Figure 18-5 Flashpro III Connection Using 3-Wire Serial I/O (When Handshake Function Is Used)  | CHAPTER 18<br>μPD78F0988A     |
|         | Addition of 18.5 Pin Connection  |                               |
|         | Modification of Figure 18-14 Self Programming Flowchart  |                               |
|         | Modification of Table 18-7 Entry RAM Area  |                               |
|         | 18.6.5 Entry RAM area Change of (d) Erase time data Addition of (f) Writeback time   |                               |
|         | Modification of Table 18-8 List of Self-Write Subroutines  |                               |
|         | Modification of 18.6.6 Self-write subroutines  |                               |
|         | Development tools Addition of SP78K0 Change of part numbers of RA78K0, CC78K0, DF780988, CC78K0-L, SM78K0, ID78K0-NS, ID78K0, RX78K0, and MX78K0   | APPENDIX A DEVELOPMENT TOOLS  |
| 7th     | <ul> <li>Addition of package         μPD780982GC-xxx-8BS, 780983GC-xxx-8BS, 780984GC-xxx-8BS         μPD780986GC-xxx-8BS, 780988GC-xxx-8BS, 78F0988AGC-8BS         μPD780982GC(A)-xxx-8BS, 780983GC(A)-xxx-8BS, 780984GC(A)-xxx-8BS         μPD780986GC(A)-xxx-8BS, 780988GC(A)-xxx-8BS     </li> <li>Change of power supply voltage range as shown below.         V<sub>DD</sub> = 4.0 to 5.5 V → V<sub>DD</sub> = 3.0 to 5.5 V (expanded-specification products),         V<sub>DD</sub> = 4.0 to 5.5 V (conventional products)</li> <li>Change of system clock oscillation frequency (fx) as shown below.         fx = 8.38 MHz → fx = 12 MHz (expanded-specification products only), fx =8.38 MHz</li> <li>Change of minimum instruction execution time</li> </ul> | Throughout                    |
|         | Addition of 1.1 Expanded-Specification Products and Conventional Products  | CHAPTER 1 GENERAL             |
|         | <ul> <li>1.6 Pin Configuration (Top View)</li> <li>Addition of Cautions 2 and 3 to 64-pin plastic SDIP (19.05 mm (750))</li> <li>Addition of Cautions 2 and 3 to 64-pin plastic QFP (14 x 14),</li> <li>64-pin plastic LQFP (14 x 14)</li> </ul>   |                               |
|         | 3.1.2 Internal data memory space Addition of description on (1) Internal high-speed RAM and (2) Internal expansion RAM   | CHAPTER 3<br>CPU ARCHITECTURE |
|         | Modification of Table 5-2 Relationship Between CPU Clock and Minimum Instruction Execution Time  | CHAPTER 5 CLOCK<br>GENERATOR  |
|         | Modification of Figure 5-5 Switching Between System Clock and CPU Clock  |                               |
|         | Modification of Figure 6-9 Format of Prescaler Mode Register 00  | CHAPTER 6 16-BIT              |
|         | Modification of Figure 6-10 Format of Prescaler Mode Register 01   | TIMER/EVENT COUNTER           |
|         | Addition of Figure 6-16 Configuration Diagram of PPG Output  |                               |
|         | Addition of Figure 6-17 PPG Output Operation Timing  |                               |
|         | Modification of Figure 7-7 Format of Timer Clock Select Register 50  | CHAPTER 7 8-BIT               |
|         | Modification of Figure 7-8 Format of Timer Clock Select Register 51  | TIMER/EVENT COUNTER           |
|         | Modification of Figure 7-9 Format of Timer Clock Select Register 52  |                               |
