# High Performance Audio Codec Sub-System with a Ground-Referenced Stereo Headphone Amplifier & an Ultra Low EMI Class D Loudspeaker Amplifier with Dual I<sup>2</sup>S/PCM Digital Audio Interfaces

## 1.0 General Description

The LM49350 is a high performance audio subsystem that supports both analog and digital audio functions. The LM49350 includes a high quality stereo DAC, a high quality stereo ADC, a stereo headphone amplifier that supports ground referenced output cap-less operation, a dual mode earpiece speaker amplifier, and a low EMI Class D loudspeaker amplifier. It is designed for demanding applications in mobile phones and other portable devices.

The LM49350 features dual bi-directional I<sup>2</sup>S or PCM audio interfaces for full range audio and an I<sup>2</sup>C compatible interface for control. The stereo DAC path features an SNR of 96dB with 24-bit 48 kHz input. The headphone amplifier delivers 69mW<sub>RMS</sub> (typ) to a 32Ω single-ended stereo load with less than 1% distortion (THD+N) when A<sub>VDD</sub> = 3.3V. The earpiece speaker amplifier delivers 58mW<sub>RMS</sub> (typ) to a 32Ω bridged-tied load with less than 1% distortion (THD+N) when A<sub>VDD</sub> = 3.3V. The loudspeaker amplifier delivers up to 495mW into an 8Ω load with less than 1% distortion when LS<sub>VDD</sub> = 3.3V and up to 1.2W when LS<sub>VDD</sub> = 5.0V.

The LM49350 employs advanced techniques to reduce power consumption, to reduce controller overhead, to speed development time, and to eliminate click and pop. Boomer audio power amplifiers were designed specifically to provide high quality output power with a minimal amount of external components. It is therefore ideally suited for mobile phone and other low voltage applications where minimal power consumption, PCB area and cost are primary requirements.

## 2.0 Applications

- Smart Phones
- Mobile Phones and VOIP Phones
- Portable GPS Navigator and Portable Gaming Devices
- Portable DVD/CD/AAC/MP3/MP4 Players
- Digital Cameras/Camcorders

## 3.0 Key Specifications

- P<sub>HP</sub> at A<sub>VDD</sub> = 3.3V, Stereo 32Ω, 1% THD 69mW/ch (typ)
- P<sub>LS</sub> at LS<sub>VDD</sub> = 5V, 8Ω, 1% THD 1.2W (typ)
- P<sub>LS</sub> at LS<sub>VDD</sub> = 4.2V, 8Ω, 1% THD 825mW (typ)
- P<sub>LS</sub> at LS<sub>VDD</sub> = 3.3V, 8Ω, 1% THD 495mW (typ)
- P<sub>EP</sub> at A<sub>VDD</sub> = 3.3V, 32Ω BTL, 1% THD 58mW (typ)

- Supply Voltage Range

D<sub>VDD</sub> = 1.7V to 2.0V

LS<sub>VDD</sub> and A<sub>VDD</sub> = 2.7V to 5.5V

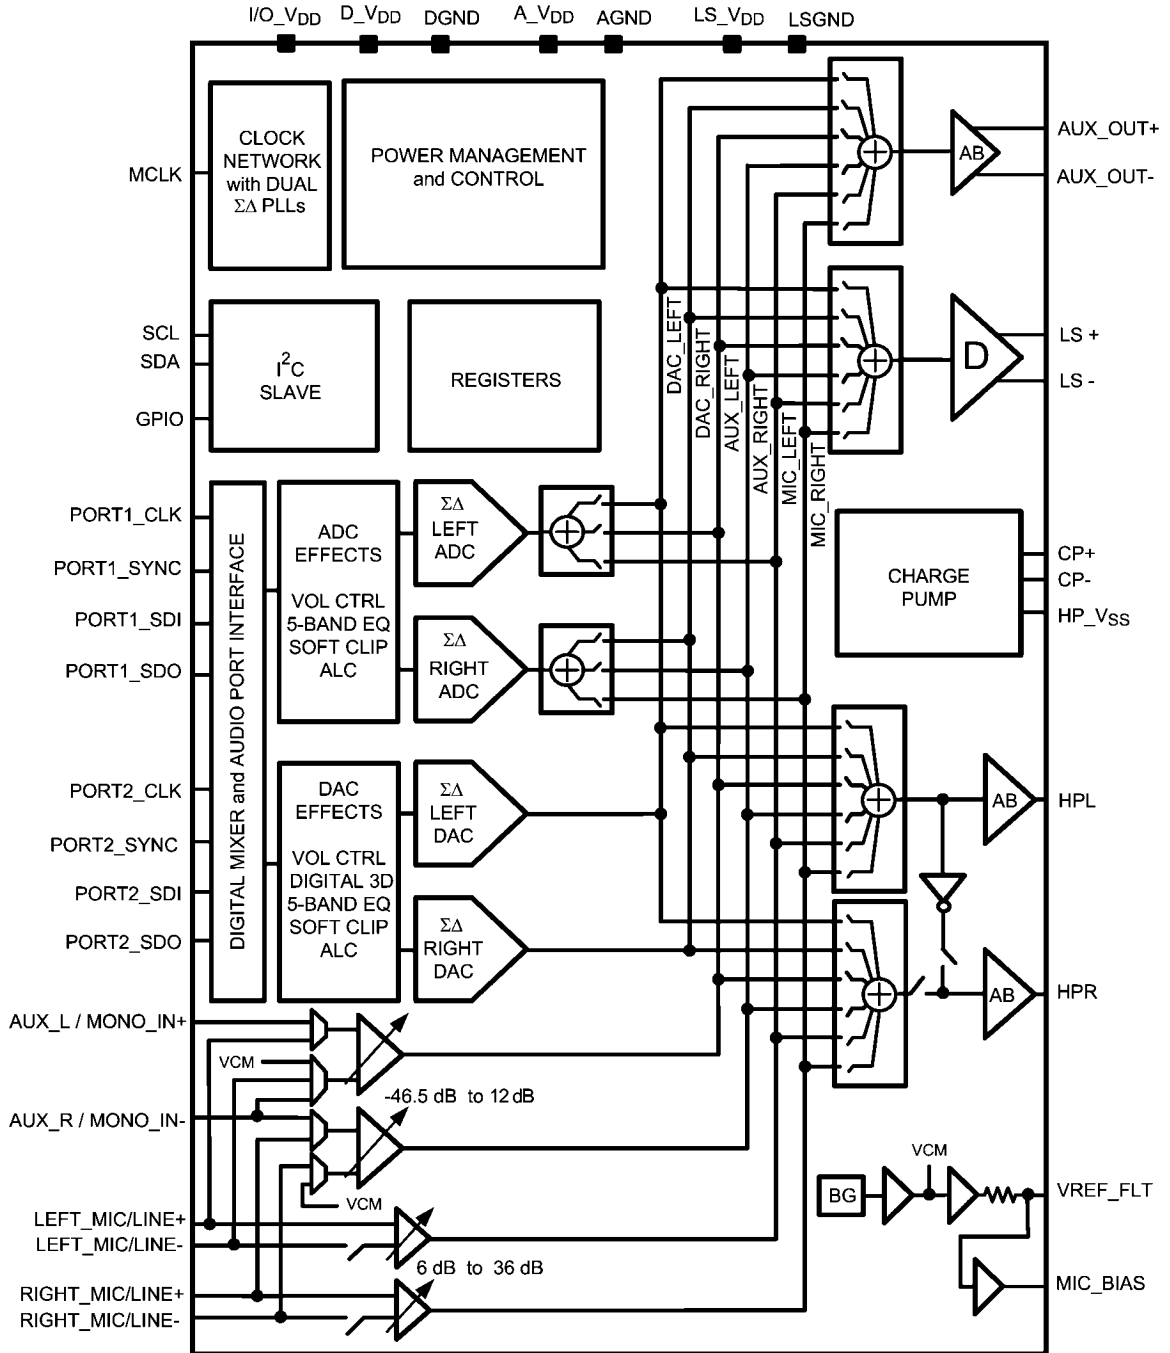

I/O<sub>VDD</sub> = 1.6V to 4.5V

- SNR (Stereo DAC at 48kHz) 96dB (typ)
- SNR (Stereo ADC at 48kHz) 94dB (typ)
- Shutdown Current 2.3μA (typ)
- PSRR at 217 Hz, A<sub>VDD</sub> = 3.3V, (HP from AUX) 97dB (typ)

## 4.0 Features

- High performance 96dB SNR stereo DAC
- High performance 94dB SNR stereo ADC
- Up to 192kHz stereo audio playback
- Up to 48kHz stereo recording
- Dual bidirectional I<sup>2</sup>S or PCM compatible audio interfaces
- Read/write I<sup>2</sup>C compatible control interface
- Flexible digital mixer with sample rate conversion
- Dual sigma-delta PLLs for operation from any clock at any sample rate
- Digital 3D stereo enhancement
- Dual 5 band parametric equalizers
- Cascadable DSP effects that allow 10 band parametric equalization
- ALC/Compressor/Limiter on both DAC and ADC paths
- Ultra low EMI, Class D loudspeaker amplifier with spread spectrum control
- Ground referenced output cap-less headphone amplifier operation
- Earpiece speaker amplifier with reduced power consumption mode for mono differential line out applications
- Stereo auxiliary inputs or mono differential input
- Differential stereo microphone inputs with single-ended option
- Automatic level control for digital audio inputs, stereo microphone inputs, and stereo auxiliary inputs
- Flexible audio routing from input to output
- 16 Step volume control for microphones with 2dB steps
- 32 Step volume control for auxiliary inputs in 1.5dB steps
- Micro-power shutdown mode
- Available in the 3.5 x 3.5 mm 36 bump micro SMD package

## Pin Descriptions

Pin	Pin Name	Type	Direction	Description
A1	HPR	Analog	Output	Headphone right output
A2	A_V <sub>DD</sub>	Supply	Input	Headphone and mixer power supply input
A3	AGND	Supply	Input	Headphone and mixer ground
A4	VREF_FLT	Analog	Input/Output	Filter point for the microphone power supply and internal references
A5	GPIO	Digital	Input/Output	General purpose input or output
A6	SDA	Digital	Input/Output	I <sup>2</sup> C interface data line
B1	HPL	Analog	Output	Headphone left output
B2	AUX_R	Analog	Input	Right analog input
B3	AUX_L	Analog	Input	Left analog input
B4	PORT2_SYNC	Digital	Input/Output	Audio Port 2 SYNC Signal (can be master or slave)
B5	PORT2_SDI	Digital	Input	Audio Port 2 serial data input
B6	SCL	Digital	Input	I <sup>2</sup> C interface clock line
C1	HP_V <sub>SS</sub>	Analog	Output	Negative power supply pin for the headphone amplifier
C2	AUX_OUT+	Analog	Output	Auxiliary positive output
C3	AUX_OUT-	Analog	Output	Auxiliary negative output
C4	PORT2_SDO	Digital	Output	Audio port 2 serial data out
C5	PORT2_CLK	Digital	Input/Output	Audio port 2 clock signal (can be master or slave)
C6	MCLK	Digital	Input	Input clock from 0.5MHz to 50 MHz
D1	CP-	Analog	Input/Output	Charge pump flying capacitor negative input
D2	CP+	Analog	Input/Output	Charge pump flying capacitor positive input
D3	MIC_BIAS	Analog	Output	Microphone ultra clean supply (2.2V)
D4	PORT1_SYNC	Digital	Input/Output	Audio Port 1 sync signal (can be master or slave)
D5	PORT1_SDO	Digital	Output	Audio Port 1 serial data output
D6	DGND	Supply	Input	Digital ground
E1	LSGND	Supply	Input	Loudspeaker ground
E2	LS_V <sub>DD</sub>	Supply	Input	Loudspeaker power supply input
E3	RIGHT_MIC-	Analog	Input	Right microphone negative input
E4	LEFT_MIC-	Analog	Output	Left microphone negative input
E5	PORT1_SDI	Digital	Input	Audio Port 1 serial data input
E6	D_V <sub>DD</sub>	Supply	Input	Digital power supply input
F1	LS +	Analog	Output	Loudspeaker positive output
F2	LS -	Analog	Output	Loudspeaker negative output
F3	RIGHT_MIC +	Analog	Input	Right microphone positive input
F4	LEFT_MIC +	Analog	Input	Left microphone positive input
F5	PORT1_CLK	Digital	Input/Output	Audio Port 1 clock signal (can be master or slave)
F6	I/O_V <sub>DD</sub>	Supply	Input	Digital interface power supply input

### 7.1 PIN TYPE DEFINITIONS

Analog Input — A pin that is used by the analog and is never driven by the device. Supplies are part of this classification.

Analog Output — A pin that is driven by the device and should not be driven by external sources.

Analog Input/Output — A pin that is typically used for filtering a DC signal within the device. Pas-

Digital Input —

Digital Output —

Digital Input/Output —

sive components can be connected to these pins.

A pin that is used by the digital but is never driven by the device.

A pin that is driven by the device and should not be driven by another device to avoid contention.

A pin that is either open drain (SDA) or a bidirectional CMOS in/out. In the latter case the direction is selected by a control register within the LM49350.

## 8.0 Absolute Maximum Ratings (Notes

1, 2)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

Analog Supply Voltage (A_V <sub>DD</sub> and LS_V <sub>DD</sub> )	6.0V
Digital Supply Voltage D_V <sub>DD</sub>	2.2V
I/O Supply Voltage I/O_V <sub>DD</sub>	5.5V
Storage Temperature	-65°C to +150°C
Power Dissipation (Note )	Internally Limited
ESD Ratings	
Human Body Model (Note )	2000V
Machine Model (Note )	200V

Junction Temperature	150°C
Thermal Resistance $\theta_{JA}$ – RLA36 (soldered down to PCB with 2in <sup>2</sup> 1oz. copper plane)	60°C/W
Soldering Information	See Applications Note AN-1112.

## 9.0 Operating Ratings

Temperature Range	-40°C to +85°C
Supply Voltage A_V <sub>DD</sub> and LS_V <sub>DD</sub>	2.7V to 5.5V
D_V <sub>DD</sub>	1.7V to 2.0V
I/O_V <sub>DD</sub>	1.6V to 4.5V

## 10.0 Electrical Characteristics: A\_V<sub>DD</sub> = LS\_V<sub>DD</sub> = 3.3V; D\_V<sub>DD</sub> = I/O\_V<sub>DD</sub> = 1.8V

(Notes 1, 2) The following specifications apply for R<sub>L(LS)</sub> = 8Ω, R<sub>L(HP)</sub> = 32Ω, f = 1kHz, unless otherwise specified. Limits apply for T<sub>A</sub> = 25°C.

**Note 1:** "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the *Absolute Maximum Ratings* or other conditions beyond those indicated in the *Recommended Operating Conditions* is not implied. The *Recommended Operating Conditions* indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified.

**Note 2:** The *Electrical Characteristics* tables list guaranteed specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics Conditions* and/or Notes. Typical specifications are estimations only and are not guaranteed.

**Note 3:** The maximum power dissipation must be derated at elevated temperatures and is dictated by T<sub>JMAX</sub>, θ<sub>JA</sub>, and the ambient temperature, T<sub>A</sub>. The maximum allowable power dissipation is P<sub>DMAX</sub> = (T<sub>JMAX</sub> - T<sub>A</sub>) / θ<sub>JA</sub> or the number given in *Absolute Maximum Ratings*, whichever is lower.

**Note 4:** Human body model, applicable std. JESD22-A114C.

**Note 5:** Machine model, applicable std. JESD22-A115-A.

**Note 6:** Typical values represent most likely parametric norms at T<sub>A</sub> = +25°C, and at the *Recommended Operation Conditions* at the time of product characterization and are not guaranteed.

**Note 7:** Datasheet min/max specification limits are guaranteed by test or statistical analysis.

## 11.0 Timing Characteristics: $DV_{DD} = I/OV_{DD} = 1.8V$ (Notes 1, 2) The following specifications apply for $R_{L(SP)} = 8\Omega$ , $R_{L(HP)} = 32\Omega$ , $f = 1kHz$ , unless otherwise specified. Limits apply for $T_A = 25^\circ C$ .

## 13.0 System Control

### Method 1. I<sup>2</sup>C Compatible Interface

#### 13.1 I<sup>2</sup>C SIGNALS

In I<sup>2</sup>C mode the LM49350 pin SCL is used for the I<sup>2</sup>C clock SCL and the pin SDA is used for the I<sup>2</sup>C data signal SDA. Both

these signals need a pull-up resistor according to I<sup>2</sup>C specification. The I<sup>2</sup>C slave address for LM49350 is **0011010<sub>2</sub>**.

#### 13.2 I<sup>2</sup>C DATA VALIDITY

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when SCL is LOW.

FIGURE 6. I<sup>2</sup>C Signals: Data Validity

#### 13.3 I<sup>2</sup>C START AND STOP CONDITIONS

START and STOP bits classify the beginning and the end of the I<sup>2</sup>C session. START condition is defined as SDA signal transitioning from HIGH to LOW while SCL line is HIGH. STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The I<sup>2</sup>C master always generates

START and STOP bits. The I<sup>2</sup>C bus is considered to be busy after START condition and free after STOP condition. During data transmission, I<sup>2</sup>C master can generate repeated START conditions. First START and repeated START conditions are equivalent, function-wise.

FIGURE 7. I<sup>2</sup>C Start and Stop Conditions

#### 13.4 TRANSFERRING DATA

Every byte put on the SDA line must be eight bits long, with the most significant bit (MSB) being transferred first. Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the master. The transmitter releases the SDA line (HIGH) during the acknowledge clock pulse. The receiver must pull down the SDA line during the 9<sup>th</sup> clock pulse, signifying an acknowledge. A receiver which has been addressed must generate an acknowledge after each byte has been received.

After the START condition, the I<sup>2</sup>C master sends a chip address. This address is seven bits long followed by an eight bit which is a data direction bit (R/W). The LM49350 address is **0011010<sub>2</sub>**. For the eighth bit, a “0” indicates a WRITE and a “1” indicates a READ. The second byte selects the register to which the data will be written. The third byte contains data to write to the selected register.

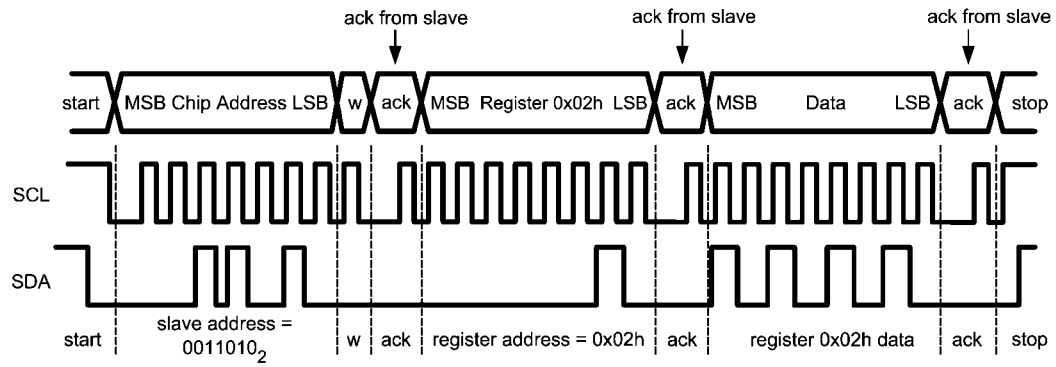

FIGURE 8. I<sup>2</sup>C Chip Address

Register changes take effect at the SCL rising edge during the last ACK from slave.

20194126

w = write (SDA = "0")  
 r = read (SDA = "1")  
 ack = acknowledge (SDA pulled down by slave)  
 rs = repeated start

**FIGURE 9. Example I<sup>2</sup>C Write Cycle**

When a READ function is to be accomplished, a WRITE function must precede the READ function, as shown in the Read Cycle waveform.

20194127

FIGURE 10. Example I<sup>2</sup>C Read Cycle

20194128

FIGURE 11. I<sup>2</sup>C Timing Diagram

13.5 I<sup>2</sup>C TIMING PARAMETERS

Symbol	Parameter	Limit		Units
		Min	Max	
1	Hold Time (repeated) START Condition	0.6		μs
2	Clock Low Time	1.3		μs
3	Clock High Time	600		ns
4	Setup Time for a Repeated START Condition	600		ns
5	Data Hold Time (Output direction, delay generated by LM49350)	300	900	ns
5	Data Hold Time (Input direction, delay generated by the Master)	0	900	ns
6	Data Setup Time	100		ns
7	Rise Time of SDA and SCL	20+0.1C <sub>B</sub>	300	ns
8	Fall Time of SDA and SCL	15+0.1C <sub>B</sub>	300	ns
9	Set-up Time for STOP condition	600		ns
10	Bus Free Time between a STOP and a START Condition	1.3		μs
C <sub>B</sub>	Capacitive Load for Each Bus Line	10	200	pF

NOTE: Data guaranteed by design

## 15.0 Basic PMC Setup Register

This register is used to control the LM49350's Basic Power Management Setup:

**TABLE 2. PMC\_SETUP (0x00h)**

Bits	Field	Description	
0	CHIP_ENABLE	When this bit is set the power management will enable the MCLK I/O or internal oscillator <sup>1</sup> . It will then use this clock to sequence the enabling of the analog references and bias points. When this bit is cleared the PMC will bring the analog down gently and disable the MCLK or oscillator.	
		CHIP_ENABLE	Chip Status
		0	Turn Chip Off
		1	Turn Chip On
1	PLL1_ENB	This enables the primary PLL	
		PLL1_ENABLE	PLL1 Status
		0	PLL1 Off
1	PLL1 On		
2	PLL2_ENB	This enables the secondary PLL	
		PLL2_ENABLE	PLL2 Status
		0	PLL2 Off
1	PLL2 On		
3	OSC_ENB	This enables the internal 300kHz Oscillator. For analog only chip modes, the oscillator can be used instead of an external system clock to drive the chip's power management (PMC).	
		OSC_ENABLE	Oscillator Status
		0	Oscillator Off
1	Oscillator On		
4	MCLK_OVR	This forces the MCLK input to enable, regardless of requirement. If set, the audio ports and digital mixer can be activated even if the chip is in shutdown mode. This assumes that MCLK is selected as the clock source and that there is an active clock signal driving the MCLK pin. Setting this bit reduces power consumption, by allowing audio ports and digital mixer to operate while the analog sections of the chip is powered down.	
		MCLK_OVR	Comment
		0	I/O control is automatic
1	MCLK input forced on.		
5	PORT1_CLK_OVR	This forces the clock input of Audio Port 1 input to enable, regardless of other port settings.	
		PORT1_CLK_OVR	Comment
		0	I/O control is automatic
1	PORT_CLK input forced on		
6	PORT2_CLK_OVR	This forces the clock input of Audio Port 2 input to enable, regardless of other port settings.	
		PORT2_CLK_OVR	Comment
		0	I/O control is automatic
1	PORT_CLK input forced on		
7	CHIP_ACTIVE	This bit is used to read back the enable status of the chip.	

1. If the PMC is set to operate from one of the audio ports then it will wait for the port to be enabled or the relevant over ride bit to be set, forcing the port clock input to enable.

## 16.0 PMC Clocks Register

This register is used to control the LM49350's Basic Power Management Setup:

**TABLE 3. PMC\_SETUP (0x01h)**

Bits	Field	Description	
1:0	PMC_CLK_SEL	This selects the source of the PMC input clock.	
		PMC_CLK_SEL	PMC Input Clock Source
		00	MCLK (Default divide is 40)
		01	Internal 300kHz Oscillator
		10	DAC SOURCE CLOCK
		11	ADC SOURCE CLOCK

## 17.0 PMC Clock Divide Register

This register is used to control the LM49350's Power Management Circuits Clocks:

**TABLE 4. PMC\_SETUP (0x02h) (Default data value is 0x50h)**

Bits	Field	Description	
7:0	PMC_CLK_DIV	This programs the half cycle divider that precedes the PMC. The PMC should run from a 300kHz clock. The default of this divider is 0x50h (divide by 40) to get a $\approx$ 300kHz PMC clock from a 12MHz or 12.288MHz MCLK. Program this divider with the division you want, multiplied by 2, and subtract 1.	
		PMC_CLK_DIV	Divide by
		00000000	1
		00000001	1
		00000010	1.5
		00000011	2
		00000100	2.5
		00000101	3
		—	—
		11111101	126
		11111110	127.5
		11111111	128

## 18.0 LM49350 Clock Network

### (Refer to Figure 12)

The audio DAC and ADC operate at a clock frequency of  $2 \cdot \text{OSR} \cdot f_s$  where OSR is the oversampling ratio and  $f_s$  is the sampling frequency of the DAC or ADC. The DAC can operate at four different OSR settings (128, 125, 64, 32). The ADC can operate at three different OSR settings (128, 125, 64). For example, if the stereo DAC or ADC is set at OSR = 128, a 12.288MHz clock is required for 48kHz data. If a 12.288MHz clock is not available, then one of the LM49350's dual PLLs can be used to generate the desired clock frequency. Otherwise, if a 12.288MHz is available, then the PLL can be bypassed to reduce power consumption. The DAC clock divider (S divider) or ADC clock divider (T divider) can also be used to generate the correct clock. If an 18.432 MHz clock is available, the S or T divider could be set to 1.5 in order to generate a 12.288MHz clock from 18.432MHz without using a PLL.

The DAC path clock (DAC\_SOURCE\_CLK) and ADC path clock (ADC\_SOURCE\_CLK) can be driven directly by the MCLK input, the PORT1\_CLK input, the PORT2\_CLK input, PLL1's output, or PLL2's output.

For instances where a PLL must be used, the PLL input clock can come from three sources. The clock input to PLL1 or PLL2 can come from the MCLK input, the PORT1\_CLK input, or the PORT2\_CLK input.

The LM49350's Power Management Circuit (PMC) requires a clock that is independent from the DAC or ADC. It is recommended to provide a  $\approx 300\text{kHz}$  clock at Point C. The PMC clock divider (R divider) is available to generate the correct clock to the PMC block. The PMC clock path can be driven directly by the MCLK input, the internal 300kHz oscillator, the DAC\_SOURCE\_CLK, or the ADC\_SOURCE\_CLK.

TABLE 5. DAC Clock Requirements

DAC Sample Rate (kHz)	Clock Required at A (OSR = 128)	Clock Required at A (OSR= 125)	Clock Required at A (OSR = 64)	Clock Required at A (OSR = 32)
8	2.048 MHz	2 MHz	1.024 MHz	0.512 MHz
11.025	2.8224 MHz	2.75625 MHz	1.4112 MHz	0.7056 MHz

FIGURE 12. Internal Clock Network

## 19.0 PLL Setup Registers

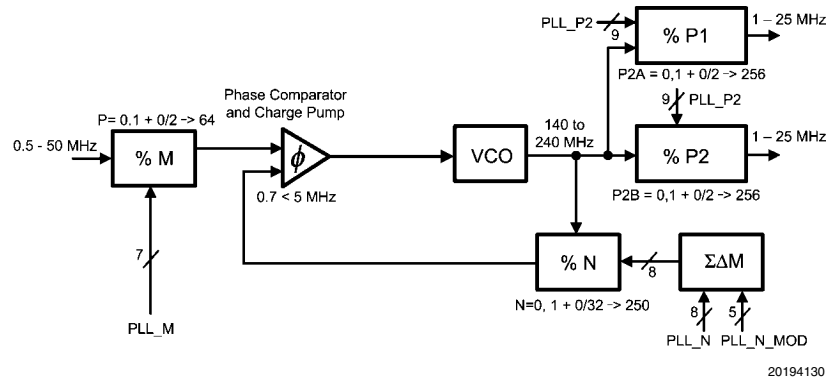

FIGURE 13. PLL1 Loop

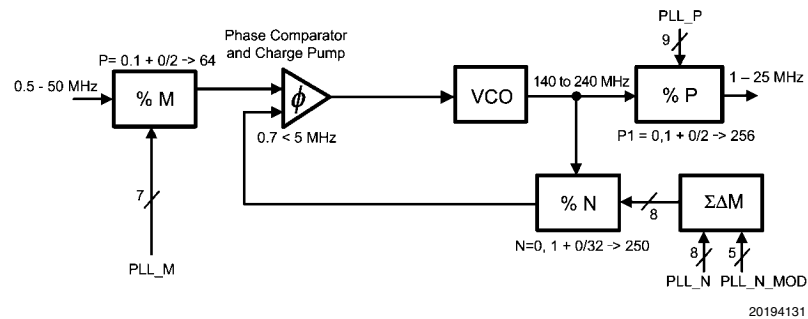

FIGURE 14. PLL2 Loop

The LM49350 contains two PLLs for flexible operation of its dual audio ports. PLL1 has a P1 and P2 output divider thereby allowing PLL1 to generate two distinct clock outputs. The equations for PLL1's generated output clocks are as follows:

$$f_{OUT1} = (f_{IN} \cdot N_1 / M_1 \cdot P_1)$$

$$f_{OUT2} = (f_{IN} \cdot N_1 / M_1 \cdot P_2)$$

where:

$$N_1 = PLL1\_N + PLL1\_N\_MOD$$

$$M_1 = (PLL1\_M + 1) / 2$$

$$P_1 = (PLL1\_P1 + 1) / 2$$

$$P_2 = (PLL1\_P2 + 1) / 2$$

The equations for PLL2's generated output clock are as follows:

$$f_{OUT3} = (f_{IN} \cdot N_2 / M_2 \cdot P)$$

where:

$$N_2 = PLL2\_N + PLL2\_N\_MOD$$

$$M_2 = (PLL2\_M + 1) / 2$$

$$P = (PLL2\_P + 1) / 2$$

The VCO frequency and comparison frequencies are as follows:

$$f_{VCO} = f_{OUT} \cdot P$$

$$f_{COMP} = f_{IN} / M$$

Keep  $f_{VCO}$  between 140MHz to 240MHz and keep  $f_{COMP}$  between 700kHz to 5MHz.

TABLE 7. PLL Settings for Common System Clock Frequencies

$f_{IN}$ (MHz)	M	N	N_MOD	P	$f_{OUT}$ (MHz)	Error (Hz)

## 20.0 Analog Mixer Control Registers

This register is used to control the LM49350's Analog Mixer:

**TABLE 18. CLASS\_D\_OUTPUT (0x10h)**

Bits	Field	Description
0	DACR_LS	The right DAC output is added to the loudspeaker output.
1	DACL_LS	The left DAC output is added to the loudspeaker output.
2	MICR_LS	The right MIC input is added to the loudspeaker output. Setting this bit enables MIC BIAS.
3	MICL_LS	The left MIC input is added to the loudspeaker output. Setting this bit enables MIC BIAS.
4	AUXR_LS	The right AUX input is added to the loudspeaker output.
5	AUXL_LS	The left AUX input is added to the loudspeaker output.

### 20.1 CLASS D LOUDSPEAKER AMPLIFIER

The LM49350 features a filterless modulation scheme. The differential outputs of the device switch at 300kHz from  $V_{DD}$  to GND. When there is no input signal applied, the two outputs (LS+ and LS-) switch with a 50% duty cycle, with both outputs in phase. Because the outputs of the LM49350 are differential, the two signals cancel each other. This results in no net voltage across the speaker, thus there is no load current during an idle state, conserving power.

With an input signal applied, the duty cycle (pulse width) of the LM49350 outputs changes. For increasing output voltages, the duty cycle of LS+ increases, while the duty cycle of LS- decreases. For decreasing output voltages, the converse occurs, the duty cycle of LS- increases while the duty cycle of LS+ decreases. The difference between the two pulse widths yields the differential output voltage.

### 20.2 SPREAD SPECTRUM MODULATION

The LM49350 features a filterless spread spectrum modulation scheme that eliminates the need for output filters, ferrite beads or chokes. The switching frequency varies by  $\pm 30\%$  about a 300kHz center frequency, reducing the wideband spectral content, improving EMI emissions radiated by the speaker and associated cables and traces. Where a fixed frequency class D exhibits large amounts of spectral energy at multiples of the switching frequency, the spread spectrum architecture of the LM49350 spreads that energy over a larger bandwidth. The cycle-to-cycle variation of the switching period does not affect the audio reproduction or efficiency.

### 20.3 CLASS D POWER DISSIPATION AND EFFICIENCY

In general terms, efficiency is considered to be the ratio of useful work output divided by the total energy required to produce it with the difference being the power dissipated, typically, in the IC. The key here is "useful" work. For audio systems, the energy delivered in the audible bands is considered useful including the distortion products of the input

signal. Sub-sonic (DC) and super-sonic components ( $>22\text{kHz}$ ) are not useful. The difference between the power flowing from the power supply and the audio band power being transduced is dissipated in the LM49350 and in the transducer load. The amount of power dissipation in the LM49350's class D amplifier is very low. This is because the ON resistance of the switches used to form the output waveforms is typically less than  $0.25\Omega$ . This leaves only the transducer load as a potential "sink" for the small excess of input power over audio band output power. The LM49350 dissipates only a fraction of the excess power requiring no additional PCB area or copper plane to act as a heat sink.

#### EMI/RFI Filtering

If system level PCB layout constraints require the LM49350's Class D output bumps to be placed far away from the speaker or the Class D output traces to be routed near EMI/RFI sensitive components, an external EMI/RFI filter should be used. A series ferrite bead placed close to the Class D output bumps along with a shunt capacitor to ground placed close to the ferrite bead will reduce the EMI/RFI emissions of the Class D amplifier's switching outputs. The ferrite bead must be rated with a current rating high enough to properly drive the loudspeaker. The ferrite bead that is rated for 1A or greater is recommended. The DC resistance of the ferrite bead is another important specification that must be taken into consideration. A low DC resistance will minimize any power losses dissipated by the EMI/RFI filter thereby preserving the power efficiency advantages of the Class D amplifier. Selecting a ferrite bead with high DC resistance will decrease output power delivered to speaker and reduce the Class D amplifier's efficiency. The shunt capacitor needs to have low ESR. A 10pF ceramic capacitor with a X7R dielectric is recommended as a starting point. Care needs to be taken to ensure that the value of the shunt capacitor does not exceed 47pF when using a low resistance ferrite bead in order to prevent permanent damage to the low side FETs of the Class D output stage.

TABLE 19. LEFT HEADPHONE\_OUTPUT (0x11h)

Bits	Field	Description
0	DACR_HPL	The right DAC output is added to the left headphone output.
1	DACL_HPL	The left DAC output is added to the left headphone output.
2	MICR_HPL	The right MIC input is added to the left headphone output. Setting this bit enables MIC BIAS.
3	MICL_HPL	The left MIC input is added to the left headphone output. Setting this bit enables MIC BIAS.
4	AUXR_HPL	The right AUX input is added to the left headphone output.
5	AUXL_HPL	The left AUX input is added to the left headphone output.

TABLE 20. RIGHT HEADPHONE\_OUTPUT (0x12h)

Bits	Field	Description
0	DACR_HPR	The right DAC output is added to the right headphone output.
1	DACL_HPR	The left DAC output is added to the right headphone output.
2	MICR_HPR	The right MIC input is added to the right headphone output. Setting this bit enables the MIC BIAS output.
3	MICL_HPR	The left MIC input is added to the right headphone output. Setting this bit enables the MIC BIAS output.
4	AUXR_HPR	The right AUX input is added to the right headphone output.
5	AUXL_HPR	The left AUX input is added to the right headphone output.

#### 20.4 HEADPHONE AMPLIFIER FUNCTION

The LM49350 headphone amplifier features National's ground referenced architecture that eliminates the large DC-blocking capacitors required at the outputs of traditional headphone amplifiers. A low-noise inverting charge pump creates a negative supply (HP\_V<sub>SS</sub>) from the positive supply voltage (LS\_V<sub>DD</sub>). The headphone amplifiers operate from these bipolar supplies, with the amplifier outputs biased about GND, instead of a nominal DC voltage (typically V<sub>DD</sub>/2), like traditional amplifiers. Because there is no DC component to the headphone output signals, the large DC-blocking capacitors (typically 220μF) are not necessary, conserving board space and system cost, while improving frequency response.

#### 20.5 CHARGE PUMP CAPACITOR SELECTION

Use low ESR ceramic capacitors (less than 100mΩ) for optimum performance.

#### 20.6 CHARGE PUMP FLYING CAPACITOR (C6)

The flying capacitor (C6) affects the load regulation and output impedance of the charge pump. A C6 value that is too low results in a loss of current drive, leading to a loss of amplifier headroom. A higher valued C6 improves load regulation and lowers charge pump output impedance to an extent. Above 2.2μF, the R<sub>DS(ON)</sub> of the charge pump switches and the ESR of C6 and C5 dominate the output impedance. A lower value capacitor can be used in systems with low maximum output power requirements. Please refer to the demonstration board schematic shown in Figure 23.

#### 20.7 CHARGE PUMP FLYING CAPACITOR (C5)

The value and ESR of the hold capacitor (C5) directly affects the ripple on CPV<sub>SS</sub>. Increasing the value of C5 reduces output ripple. Decreasing the ESR of C5 reduces both output ripple and charge pump output impedance. A lower value capacitor can be used in systems with low maximum output

power requirements. Please refer to the demonstration board schematic shown in Figure 23.

**TABLE 21. AUX\_OUTPUT (0x13h)**

Bits	Field	Description
0	DACR_AUX	The right DAC output is added to the AUX output.
1	DACL_AUX	The left DAC output is added to the AUX output.
2	MICR_AUX	The right MIC input is added to the AUX output. Setting this bit enables the MIC BIAS output.
3	MICL_AUX	The left MIC input is added to the AUX output. Setting this bit enables the MIC BIAS output.
4	AUXR_AUX	The right AUX input is added to the AUX output.
5	AUXL_AUX	The left AUX input is added to the AUX output.

### 20.8 AUXILIARY OUTPUT AMPLIFIER

The LM49350's auxiliary output (AUXOUT) amplifier provides differential drive capability to loads that are connected across its outputs. This results in output signals at the AUX\_OUT+ and AUX\_OUT- pins that are 180 degrees out of phase with respect to each other. This effectively doubles the maximum possible output swing for a specific supply voltage when compared to single-ended output configurations. The differential output configuration also allows the load to be isolated from ground since both the AUX\_OUT+ and AUX\_OUT- pins are biased at the same DC potential. This eliminates the need for any large and expensive DC blocking capacitors at the AUXOUT amplifier outputs. The load can then be directly connected to the positive and negative outputs of the AUXOUT

amplifier which then isolates it from any ground noise, thereby improving signal to noise ratio (SNR) and power supply rejection ratio (PSRR).

The AUXOUT amplifier has two modes of operation. The primary mode of operation is high current drive mode (Earpiece Mode) where the AUXOUT amplifier can be used to differentially drive a mono earpiece speaker. The secondary mode of operation is low current drive mode where the AUXOUT amplifier operates in a power saving mode (AUX\_LINE\_OUT Mode) to provide a differential output that is used as a mono differential line level input to a standalone mono differential input class D amplifier (LM4675) for stereo loudspeaker applications.

**TABLE 22. OUTPUT\_OPTIONS (0x14h)**

Bits	Field	Description
0	EPMODE	If set the HPR output is driven with the negative input of the HPL output stage.
1	HP_NEG_6dB	If set, both HPL and HPR are attenuated by 6dB. This is useful when adding stereo signals that need more headroom due to being highly correlated.
2	LS_NEG_6dB	If set the class D output is attenuated by 6dB. This is useful when adding stereo signals that need more headroom due to being highly correlated.
3	AUX_NEG_6dB	If set the AUX output is attenuated by 6dB. This is useful when adding stereo signals that need more headroom due to being highly correlated.
4	CP_FORCE	If set, a -LS_VDD rail will be created on HP_VSS, even if the HP output stage is not required.

**TABLE 23. ADC\_INPUT (0x15h)**

Bits	Field	Description
0	DACR_ADCL	The right DAC output is added to the ADC right input.
1	DACL_ADCL	The left DAC output is added to the ADC left input.
2	MICR_ADCL	The right MIC input is added to the ADC right input. Setting this bit enables MIC BIAS.
3	MICL_ADCL	The left MIC input is added to the ADC left input. Setting this bit enables MIC BIAS.
4	AUXR_ADCL	The right AUX input is added to the ADC right input.
5	AUXL_ADCL	The left AUX input is added to the ADC left input.

011000	-9dB	111001	12dB																																																																																																																																			
011001	-7.5dB	111010	12dB																																																																																																																																			
011010	-6dB	111011	12dB																																																																																																																																			
011100	-4.5dB	111100	12dB																																																																																																																																			
011101	-3dB	111101	12dB																																																																																																																																			
011110	-1.5dB	111110	12dB																																																																																																																																			
011111	0dB	111111	12dB																																																																																																																																			
6	FROM_LINE_R	If set, the RIGHT_MIC/LINE differential input is routed to the AUX_R input amplifier for line level volume control. This bit overrides the DIFF_MODE (bit 7) setting.																																																																																																																																				
7	DIFF_MODE	If set, the stereo single-ended inputs AUX_L and AUX_R convert to a mono differential input pair MONO_IN+ and MONO_IN-. (MONO_IN+) - (MONO_IN-) is routed to the AUX_L input amplifier. (MONO_IN-) - (MONO_IN+) is routed to the AUX_R input amplifier. (unless overridden by the respective FROM_LINE bits).																																																																																																																																				

## 21.0 ADC Control Registers

This register is used to control the LM49350's ADC:

**TABLE 28. ADC Basic (0x20h)**

Bits	Field	Description		
0	MONO	This sets mono or stereo operation of the ADC.		
		MONO	ADC Operation	
		0	Stereo Audio	
		1	Mono Voice (Right ADC channel disabled, Left ADC channel active)	
1	OSR	This sets the oversampling ratio of the ADC.		
		OSR	Stereo Audio ADC Oversampling Ratio	Mono Voice ADC Oversampling Ratio
		0	128	125
		1	64	128
2	MUTE_L	If set, a digital mute is applied to the Left (or mono) ADC output.		
3	MUTE_R	If set, a digital mute is applied to the Right ADC output.		
6.4	ADC_CLK_SEL	This selects the source of the ADC clock domain, ADC_SOURCE_CLK.		
		ADC_CLK_SEL	Source	
		000	MCLK	
		001	PORT1_RX_CLK	
		010	PORT2_RX_CLK	
		011	PLL1_OUTPUT2	
100	PLL2_OUTPUT			
7	ADC_DSP_ONLY	If set the ADC's analog circuitry is disabled to reduce power consumption, however, ADC DSP functionality is maintained. This can be used to perform asynchronous resampling between audio rates of a common family. Setting this bit is also useful whenever applying Automatic Level Control (ALC) to an analog only audio path.		

**TABLE 29. ADC\_CLK\_DIV (0x21h)**

Bits	Field	Description	
7:0	ADC_CLK_DIV	This programs the half cycle divider that precedes the ADC. The input of this divider should be around 12MHz. The default of this divider is 0x00. Program this divider with the division you want, multiplied by 2, and subtract 1.	
		ADC_CLK_DIV	Divides by
		00000000	1
		00000001	1
		00000010	1.5
		00000011	2
		—	—
		11111101	127
		11111110	127.5
		11111111	128

TABLE 30. ADC TRIM (0x22h)

Bits	Field	Description
7:0	ADC_TRIM	If set, the ADC is compensated with recommended compensation filter coefficients. The recommended ADC compensation filter coefficients are programmed as follows:
		Register 0xF8h set to 0x00h
		Register 0xF9h set to 0x01h
		Register 0xFAh set to 0x96h
		Register 0xFBh set to 0xFBh
		Register 0xFC h set to 0x30h
		Register 0xFDh set to 0x62h

## 22.0 DAC Control Registers

This register is used to control the LM49350's DAC:

**TABLE 31. DAC Basic (0x30h)**

Bits	Field	Description	
1:0	MODE	This programs the over sampling ratio of the stereo DAC.	
		MODE	DAC Oversampling Ratio
		00	125
		01	128
		10	64
		11	32
2	MUTE_L	This digitally mutes the Left DAC output.	
3	MUTE_R	This digitally mutes the Right DAC output.	
6:4	DAC_CLK_SEL	This selects the source of the DAC clock domain, DAC_SOURCE_CLK.	
		DAC_CLK_SEL	Source
		000	MCLK
		001	PORT1_RX_CLK
		010	PORT2_RX_CLK
		011	PLL1_OUTPUT1
		100	PLL2_OUTPUT
7	DSP_ONLY	If set, the DAC's analog circuitry is disabled to reduce power consumption, however DAC DSP functionality is maintained. This can be used to perform asynchronous resampling between audio rates of a common family.	

**TABLE 32. DAC\_CLK\_DIV (0x31h)**

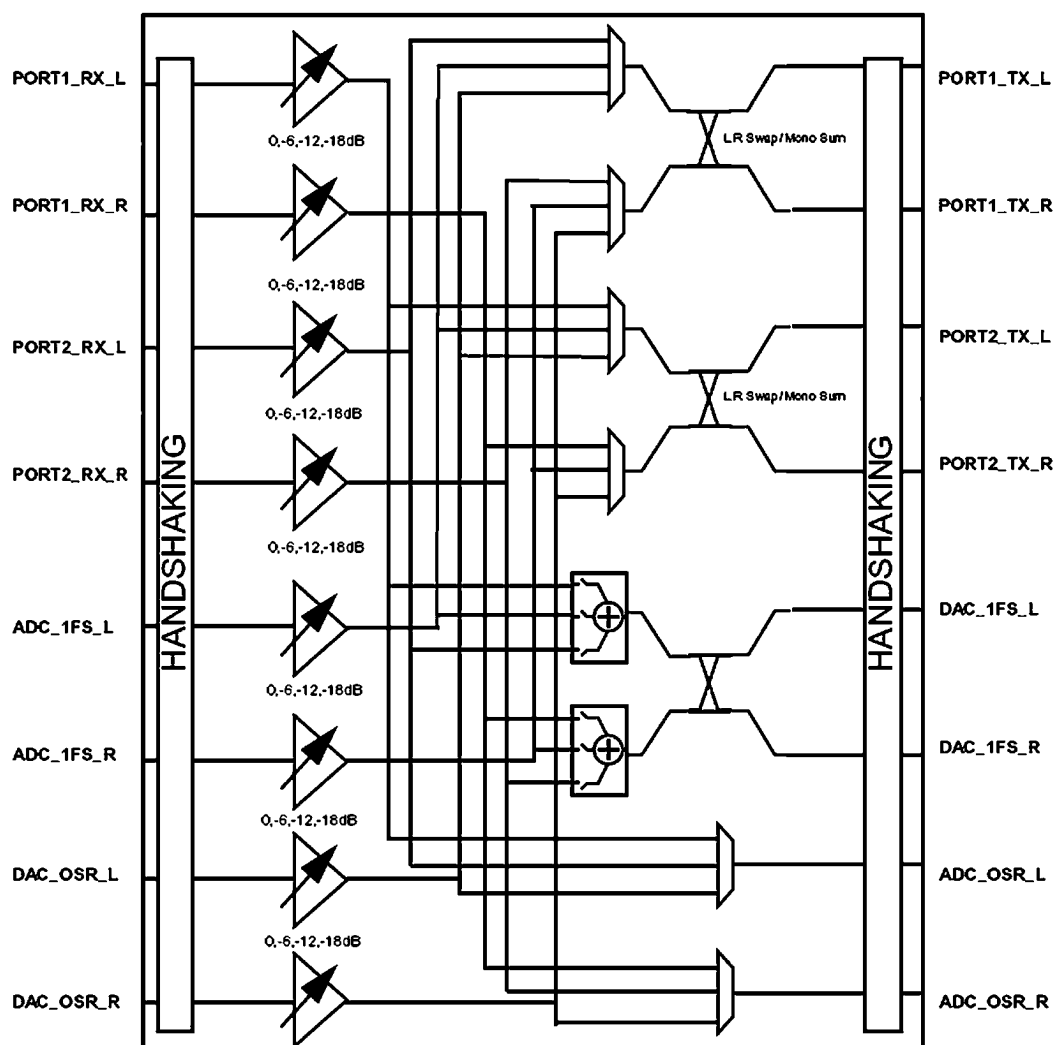

Bits	Field	Description	
7:0	DAC_CLK_DIV	This programs the half cycle divider that precedes the DAC. The input of this divider should be around 12MHz. The default of this divider is 0x00. Program this divider with the division you want, multiplied by 2, and subtract 1.	
		DAC_CLK_DIV	Divides by
		00000000	1
		00000001	1
		00000010	1.5
		00000011	2
		—	—
		11111101	127
		11111110	127.5
		11111111	128

## 23.0 Digital Mixer Control Registers

### 23.1 DIGITAL MIXER

The LM49350's digital mixer allows for flexible routing of digital audio signals between both audio ports, DAC, and ADC. This mixer handles which digital data path (Port1 RX data, Port2 RX data, or ADC output) is routed to the DAC input. The digital mixer also selects the appropriate digital data path (Port1 RX data, Port2 RX data, ADC output, DAC DSP output, or ADC DSP output) that is used for data transmission on Audio Port 1 and 2. Audio inputs to the digital mixer can be attenuated down to -18dB to avoid clipping conditions.

Another key feature of the digital mixer is sample rate conversion (SRC) between audio ports. This allows simultaneous operation of the dual audio ports even if each port is operating at a different sample rate. The LM49350 can be used as an audio port bridge with SRC capability. The digital mixer allows either straight pass through between audio ports or, if desired, DSP effects can be added to the digital audio signal during audio port bridge operation. The digital mixer automatically handles stereo I<sup>2</sup>S to mono PCM conversion between audio ports and vice versa.

20194137

FIGURE 16. Digital Mixer

The LM49350 includes two separate and independent DSP blocks, one for the DAC and the other for the ADC. The digital mixer also allows both DSP blocks to be cascaded together in either order so that the DSP effects from both blocks can

be combined into the same signal path. For example, the 5 band parametric EQ of each DSP block can be combined together to form a 10 band parametric EQ for added flexibility.

This register is used to control the LM49350's digital mixer:

**TABLE 33. Input Levels 1 (0x40h)**

Bits	Field	Description	
1:0	PORT1_RX_L_LVL	This programs the input level of the data arriving from the left receive channel of Audio Port 1.	
		PORT1_RX_L_LVL	Level
		00	0dB
		01	-6dB
		10	-12dB
		11	-18dB
3:2	PORT1_RX_R_LVL	This programs the input level of the data arriving from the right receive channel of Audio Port 1.	
		PORT1_RX_R_LVL	Level
		00	0dB
		01	-6dB
		10	-12dB
		11	-18dB
5:4	PORT2_RX_L_LVL	This programs the input level of the data arriving from the left receive channel of Audio Port 2.	
		PORT2_RX_L_LVL	Level
		00	0dB
		01	-6dB
		10	-12dB
		11	-18dB
7:6	PORT2_RX_R_LVL	This programs the input level of the data arriving from the right receive channel of Audio Port 2.	
		PORT2_RX_R_LVL	Level
		00	0dB
		01	-6dB
		10	-12dB
		11	-18dB

**TABLE 34. Input Levels 2 (0x41h)**

Bits	Field	Description	
1:0	ADC_L_LVL	This programs the input level of the data arriving from the left ADC channel.	
		ADC_L_LVL	Level
		00	0dB
		01	-6dB
		10	-12dB
		11	-18dB
3:2	ADC_R_LVL	This programs the input level of the data arriving from the right ADC channel.	
		ADC_R_LVL	Level
		00	0dB
		01	-6dB
		10	-12dB
		11	-18dB
5:4	INTERP_L_LVL	This programs the input level of the data arriving from the left DAC's interpolator output.	
		INTERP_L_LVL	Level
		00	0dB
		01	-6dB
		10	-12dB
		11	-18dB

Bits	Field	Description	
7:6	INTERP_R_LVL	This programs the input level of the data arriving from the right DAC's interpolator output.	
		INTERP_R_LVL	Level
		00	0dB
		01	-6dB
		10	-12dB
		11	-18dB

TABLE 35. Audio Port 1 Input (0x42h)

Bits	Field	Description	
1:0	L_SEL	This selects which input is fed to the Left TX Channel of Audio Port 1.	
		L_SEL	Selected Input
		00	None
		01	ADC_L
		10	PORT2_RX_L
		11	DAC_INTERP_L
3:2	R_SEL	This selects which input is fed to the Right TX Channel of Audio Port 1.	
		R_SEL	Selected Input
		00	None
		01	ADC_R
		10	PORT2_RX_R
		11	DAC_INTERP_R
4	SWAP	If set, this swaps the Left and Right outputs to Audio Port 1.	
5	MONO	If set, the right channel is ignored and the left channel becomes (left+right)/2.	

TABLE 36. Audio Port 2 Input (0x43h)

Bits	Field	Description	
1:0	L_SEL	This selects which input is fed to Audio Port 2's Left TX Channel.	
		L_SEL	Selected Input
		00	None
		01	ADC_L
		10	PORT1_RX_L
		11	DAC_INTERP_L
3:2	R_SEL	This selects which input is fed to Audio Port 2's Right TX Channel.	
		R_SEL	Selected Input
		00	None
		01	ADC_R
		10	PORT1_RX_R
		11	DAC_INTERP_R
4	SWAP	If set, this swaps the Left and Right outputs to audio port 2.	
5	MONO	If set, the right channel is ignored and the left channel becomes (left+right)/2.	

**TABLE 37. DAC Input Select (0x44h)**

Bits	Field	Description
0	PORT1_L	This adds Audio Port 1's left RX channel to the DAC's left input.
1	PORT2_L	This adds Audio Port 2's left RX channel to the DAC's left input.
2	ADC_L	This adds the ADC's left output to the DAC's left input
3	PORT1_R	This adds Audio Port 1's right RX channel to the DAC's right input.
4	PORT2_R	This adds Audio Port 2's right RX channel to the DAC's right input.
5	ADC_R	This adds the ADC's right output to the DAC's right input.
6	SWAP	If set, this swaps the Left and Right inputs to the DAC.

**TABLE 38. Decimator Input Select (0x45h)**

Bits	Field	Description	
1:0	L_SEL	This selects which input is fed to the left ADC's decimator input.	
		L_SEL	Selected Input
		00	None
		01	PORT1_RX_L
		10	PORT2_RX_L
3:2	R_SEL	This selects which input is fed to the right ADC's decimator input.	
		R_SEL	Selected Input
		00	None
		01	PORT1_RX_R
		10	PORT2_RX_R
5:4	MXR_CLK_SEL	This selects sets the source of the Digital Mixer Clock. The 'Auto' setting will automatically select the source with the highest clock frequency. Whenever the DAC interpolator (DAC_OSR_L or DAC_OSR_R) is selected then MXR_CLK_SEL should be set to '10'.	
		MXR_CLK_SEL	Selected Input
		00	Auto
		01	MCLK
		10	DAC
		11	ADC

## 24.0 Audio Port Control Registers

FIGURE 17. I<sup>2</sup>S Serial Data Format (24 bit example)

FIGURE 18. Left Justified Data Format (24 bit example)

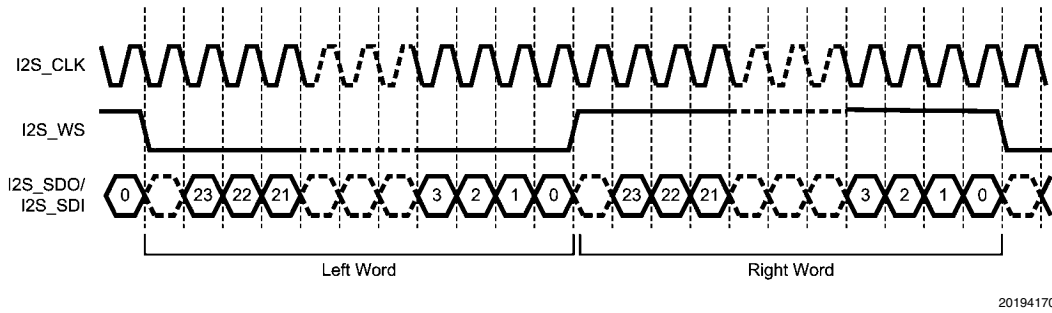

FIGURE 19. Right Justified Data Format (24 bit example)

FIGURE 20. PCM Serial Data Format (16 bit example)

The following registers are used to control the LM49350's audio ports. Audio Port 1 and Audio Port 2 are identical. Port 1 is programmed through the (0x5Xh) registers. Port 2 is programmed through the (0x6Xh) registers.

**TABLE 39. BASIC\_SETUP (0x50h/0x60h)**

Bits	Field	Description	
0	STEREO	If set, the audio port will receive and transmit stereo data.	
1	RX_ENABLE	If set the input is enabled (enables the SDI port and input shift register and any clock generation required).	
2	TX_ENABLE	If set the output is enabled (enables the SDO port and output shift register and any clock generation required).	
3	CLOCK_MS	If set the audio port will transmit the clock when either the RX or TX is enabled.	
4	SYNC_MS	If set the audio port will transmit the sync signal when either the RX or TX is enabled.	
5	CLOCK_PHASE	This sets how data is clocked by the Audio Port.	
		CLOCK_PHASE	Audio Data Mode
		0	I <sup>2</sup> S (TX on falling edge, RX on rising edge)
1	PCM (TX on rising edge, RX on falling edge)		
6	STEREO_SYNC_PHASE	If set, this reverses the left and right channel data of the Audio Port.	
		STEREO_SYNC_PHASE	Audio Port Data Orientation
		0	Left channel data goes to left channel output. Right channel data goes to right channel output.
1	Right channel data goes to left channel output. Left channel data goes to right channel output.		
7	SYNC_INVERT	If this bit is set the SYNC is inverted before the receiver and transmitter.	
		SYNC_INVERT	Sync Orientation
		0	SYNC Low = Left, SYNC High = Right
1	SYNC Low = Right, SYNC High = Left		

**TABLE 40. CLK\_GEN\_1 (0x51h/0x61h)**

Bits	Field	Description	
5:0	HALF_CYCLE_CLK_DIV	This programs the half-cycle divider that generates the master clocks in the audio port. The input of this divider should be around 12MHz. The default of this divider is 0x00, i.e. bypassed. Program this divider with the division you want, multiplied by 2, and subtract 1.	
		HALF_CYCLE_CLK_DIV	Divides By
		000000	BYPASS
		000001	1
		000010	1.5
		000011	2
		—	—
		111101	31
		111110	31.5
111111	32		
6	CLOCK_SEL	This selects the clock source of the master mode Audio Port Clock generator's half-cycle divider. 0 = DAC_SOURCE_CLK 1 = ADC_SOURCE_CLK	

TABLE 41. CLK\_GEN\_1 (0x52h/62h)

Bits	Field	Description	
2:0	SYNTH_NUM	Along with SYNTH_DENOM, this sets the clock divider that generates the Port 1 or Port 2 clock in master mode.	
		SYNTH_NUM	Numerator
		000	SYNTH_DENOM (1/1)
		001	100/SYNTH_DENOM
		010	96/SYNTH_DENOM
		011	80/SYNTH_DENOM
		100	72/SYNTH_DENOM
		101	64/SYNTH_DENOM
		110	48/SYNTH_DENOM
111	0/SYNTH_DENOM		
3	SYNTH_DENOM	Along with SYNTH_NUM, this sets the clock divider that generates the Port 1 or Port 2 clock in master mode.	
		SYNTH_DENOM	Denominator
		0	128
		1	125

TABLE 42. CLK\_GEN\_1 (0x53h/63h)

Bits	Field	Description	
2:0	SYNC_RATE	This sets the number of clock cycles before the sync pattern repeats. This depends if the audio port data is mono or stereo.	
		<b>In MONO mode:</b>	
		SYNC_RATE	Number of Clock Cycles
		000	8
		001	12
		010	16
		011	18
		100	20
		101	24
		110	25
		111	32
		<b>In STEREO mode:</b>	
		SYNC_RATE	Number of Clock Cycles
		000	16
		001	24
		010	32
		011	36
		100	40
		101	48
110	50		
111	64		

Bits	Field	Description	
5:3	SYNC_WIDTH	In MONO mode, this programs the width (in number of bits) of the SYNC signal.	
		SYNC_WIDTH	Width of SYNC (in bits)
		000	1
		001	2
		010	4
		011	7
		100	8
		101	11
		110	15
	111	16	

TABLE 43. DATA\_WIDTHS (0x54h/64h)

Bits	Field	Description	
2:0	RX_WIDTH	This programs the expected bits per word of the serial data input SDI.	
		RX_WIDTH	Bits
		000	24
		001	20
		010	18
		011	16
		100	14
		101	13
		110	12
	111	8	
5:3	TX_WIDTH	This programs the bits per word of the serial data output SDO.	
		TX_WIDTH	Description
		000	24
		001	20
		010	18
		011	16
		100	14
		101	13
		110	12
	111	8	
7:6	TX_EXTRA_BITS	This programs the TX data output padding.	
		TX_EXTRA_BITS	Description
		00	0
		01	1
		10	High-Z
	11	High-Z	

TABLE 44. TX\_MODE (0x55h/x65h)

Bits	Field	Description	
0	TX_MODE	This sets the TX data input justification with respect to the SYNC signal.	
		TX_MODE	Description
		0	MSB Justified
		1	LSB Justified
5:1	MSB_POSITION	This specifies the bit location of the MSB from the start of the frame (MSB Justified) or from the end of the frame (LSB Justified).	
		MSB_POSITION	Description
		00000	0(Left Justified/PCM Long)
		00001	1(I <sup>2</sup> S/PCM Short)
		00010	2
		00011	3
		00100	4
		00101	5
		00110	6
		00111	7
		01000	8
		01001	9

		11100	28
		11101	29
11110	30		
11111	31		
6	COMPAND	If set, audio data will be companded.	
7	μLaw/A-Law	This sets the audio companding mode.	
		μLaw/A-Law	Compand Mode
		0	μLaw
		1	A-Law

## 25.0 Digital Effects Engine

### 25.1 DIGITAL SIGNAL PROCESSOR (DSP)

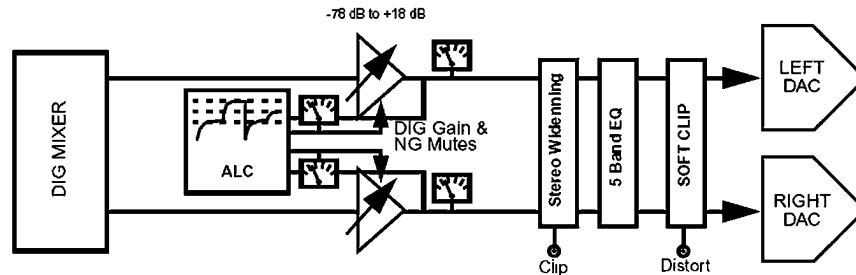

The LM49350 is designed to handle the entire audio signal conditioning and processing within the audio system, thereby freeing up the workload of any other applications processor contained within the system. The LM49350 features two independent DSPs, one for the DAC and the other for the ADC. Each DSP is fully featured and performs as a professional

quality digital audio effects engine. The data paths on each DSP engine are 24 bits wide for ultimate flexibility. Both DSP engines feature digital volume control, automatic level control (ALC), digital soft clip compression, and a 5-band parametric EQ. The ADC DSP engine adds a dedicated high-pass filter to reduce wind noise or pop noise during uplink. The DAC DSP engine adds a digital 3D algorithm that allows for stereo widening of the original audio signal. The effects chain of each DSP engine is shown by the diagrams below.

20194135

FIGURE 21. ADC DSP Effects Chain

20194136

FIGURE 22. DAC DSP Effects Chain

The ADC and DAC DSP engines can be cascaded together in any order via the digital mixer to combine different audio effects to the same signal path. For example, a signal can be processed with high-pass filtering from the ADC effects engine with 3D stereo widening from the DAC effects engine.

The 5-band parametric EQs from each DSP engine can be combined to form a single 10-band parametric EQ or a single 5-band parametric EQ with  $\pm 30\text{dB}$  (instead of  $\pm 15\text{dB}$ ) gain control for each band.

TABLE 45. ADC EFFECTS (0x70h)

Bits	Field	Description
0	ADC_HPF_ENB	This enables the ADC's High Pass Filter.
1	ADC_ALC_ENB	This enables the ADC's Auto Level Control.
2	ADC_PK_ENB	This enables the ADC's Peak Detector.
3	ADC_EQ_ENB	This enables the ADC's 5-band Parametric EQ.
4	ADC_SCLP_ENB	This enables the ADC's Soft Clip Feature.

TABLE 46. DAC EFFECTS (0x71h)

Bits	Field	Description
0	DAC_ALC_ENB	This enables the DAC's Auto Level Control.
1	DAC_PK_ENB	This enables the DAC's Peak Detector.
2	DAC_EQ_ENB	This enables the DAC's 5-band Parametric EQ.
3	DAC_3D_ENB	This enables the DAC's Stereo Widening Circuit.
4	ADC_SCLP_ENB	This enables the DAC's Soft Clip Feature.

TABLE 47. HPF MODE (0x80h)

Bits	Field	Description	
2:0	HPF_MODE	This configures the ADC's High Pass Filter.	
		HPF_MODE	FILTER CHARACTERISTICS
		000	8kHz Voice
		001	12kHz Voice
		010	16kHz Voice
		011	24kHz Voice
		100	32kHz Voice
		101	32kHz Audio
		110	48kHz Audio
		111	96kHz Audio

**25.2 ALC OVERVIEW**

The Automatic Level Control (ALC) system can be used to regulate the audio output level to a user defined target level. The ALC feature is especially useful whenever the level of the audio input is unknown, unpredictable, or has a large dynamic range. The main purpose of the ALC is to optimize the dynamic range of the audio input to audio output path.

There are two separate and independent ALC circuits in the LM49350. One of the ALC circuits is located within the DAC DSP effects block. The other ALC circuit is integrated into the ADC DSP effects block. The DAC ALC controls the DAC digital gain. The ADC ALC controls the auxiliary input amplifier gain or microphone preamplifier gain. The dual ALCs can be used to regulate the level of the analog (Stereo Auxiliary, mono differential, Stereo MIC/LINE) and digital (Port1 Data In, Port2 Data In) audio inputs. The ALC regulated output can be routed to any of the LM49350's amplifier outputs for playback. The ALC regulated output can also be routed to Audio Port1 or Audio Port2 for digital data transmission via I<sup>2</sup>S or PCM.

Only audio inputs that are considered signals (rather than noise) are sent to the ALC's peak detector block. The peak detector compares the level of the audio input versus the ALC target level (TARGET\_LEVEL). Signals lower than the target level will be amplified and signals higher than the target level will be attenuated. Any audio input that is lower than the level specified by the noise floor level (NOISE\_FLOOR) will be considered as noise and will be gated from the ALC's peak

detector in order to avoid noise pumping. So it is important to set NOISE\_FLOOR to correlate with the signal to noise ratio of the corresponding audio path. In some instances (ie. Conference calls), it may be desirable to mute audio input signals that consist solely of background noise from the audio output. This is accomplished by enabling the ALC's noise gate (NG\_ENB). When the noise gate is enabled, signals lower than the noise floor level will be muted from the audio output.

If the audio input signal is below the target level, the ALC will increase the gain of the corresponding volume control until the signal reaches the target level. The rate at which the ALC performs gain increases is known as decay rate (DECAY RATE). But before each ALC gain increase the ALC must wait a predetermined amount of time (HOLD TIME). If the audio input signal is above the target level, the ALC will decrease the gain of the corresponding volume control until the signal reaches the target level. The rate at which the ALC performs attenuation is known as attack rate (ATTACK RATE). The ALC's peak detector tracks increases in audio input signal amplitude instantaneously, but tracks decreases in audio input signal amplitude at programmable rate (PEAK DECAY TIME). ATTACK RATE, DECAY RATE, HOLD TIME, and PEAK DECAY TIME are fully adjustable which allows flexible operation of the ALC circuit. The ALC's timers are based on the sample rate of the DAC or ADC, so the closest corresponding sample rate must be programmed into the ALC SAMPLE RATE setting (for DAC ALC) or the ALC MODE setting (for ADC ALC).

20194138

**FIGURE 23. ALC Example**

**TABLE 48. ADC\_ALC\_1 (0x81h)**

Bits	Field	Description	
2:0	SAMPLE_RATE	This programs the timers on the ALC with the closest sample rate of the ADC.	
		SAMPLE_RATE	ADC Fs
		000	8kHz
		001	12kHz
		010	16kHz
		011	24kHz
		100	32kHz
		101	48kHz
		110	96kHz
111	192kHz		

Bits	Field	Description
3	LIMITER	If set, the circuit will never apply gain to the signal, no matter how small, but it will attenuate the signal as soon as it reaches target and release it at the decay rate, once signal level reduces below target. The I <sup>2</sup> C gain setting (at the time the LIMITER is enabled) is the maximum gain that the ALC will apply. Care should be taken when choosing the optimum I <sup>2</sup> C gain setting whenever enabling the Limiter.
4	STEREO LINK	If set, the ALC circuit uses the stereo average of the input signals to control the gain of the stereo output. This maintains stereo imaging. If this bit is cleared, then both channels operate as dual mono.
5	SOURCE_SEL	If SOURCE_OVR is set then this manually overrides the selection of the input amplifier that is used to alter the gain for ALC operation. 0 = Both ALCs control AUX gain 1 = Both ALCs control MIC gain
6	SOURCE_OVR	If set, the output of the ALC is not set automatically but is controlled by the SOURCE_SEL bit. If cleared each ALC controls the input gain of the amplifier (AUX or MIC) that is set to that ADC channel (or MIC if both are selected).

TABLE 49. ADC\_ALC\_2 (0x82h)

Bits	Field	Description	
3:0	NOISE_FLOOR	This sets the anticipated noise floor. Signals lower than the noise floor specified will be gated from the ALC to avoid noise pumping.	
		NOISE_FLOOR	Noise Floor (dB)
		0000	-39
		0001	-42
		0010	-45
		0011	-48
		0100	-51
		0101	-54
		0110	-57
		0111	-60
		1000	-63
		1001	-66
		1010	-69
		1011	-72
		1100	-75
		1101	-78
1110	-81		
1111	-84		
4	NG_ENB	This enables the Noise Gate.	

TABLE 50. ADC\_ALC\_3 (0x83h)

TABLE 63. SOFTCLIP1 (0x90h)

Bits	Field	Description	
3:0	THRESHOLD	This sets the threshold level of the audio compressor. Audio signals above the threshold will be compressed.	
		THRESHOLD	Threshold Level (dB)
		0000	-36dB
		0001	-30dB
		0010	-24dB
		0011	-20dB
		0100	-18dB
		0101	-17dB
		0110	-16dB
		0111	-15dB
		1000	-14dB
		1001	-12dB
		1010	-10dB
		1011	-8dB
		1100	-6dB
1101	-4dB		
1110	-2.5dB		
1111	-1dB		
4	SOFT_KNEE	If set, the audio compressor will automatically apply higher compression ratios to audio signals higher than the threshold level. As the audio signal approaches levels higher than the threshold, SOFT_KNEE will increase the compression RATIO. The highest compression that the SOFT_KNEE algorithm will apply is the compression that is set by RATIO.	

TABLE 64. SOFTCLIP2 (0x91h)

Bits	Field	Description																																																																		
4:0	RATIO	This sets the ratio at which the audio is compressed to when it passes beyond the threshold. In SOFT_KNEE mode this is the final level of compression.																																																																		
		<table border="1"> <thead> <tr> <th>RATIO</th> <th>Ratio</th> </tr> </thead> <tbody> <tr><td>00000</td><td>1:1 (Bypass)</td></tr> <tr><td>00001</td><td>1:1.2</td></tr> <tr><td>00010</td><td>1:1.4</td></tr> <tr><td>00011</td><td>1:1.7</td></tr> <tr><td>00100</td><td>1:2.0</td></tr> <tr><td>00101</td><td>1:2.4</td></tr> <tr><td>00110</td><td>1:2.8</td></tr> <tr><td>00111</td><td>1:3.4</td></tr> <tr><td>01000</td><td>1:4.0</td></tr> <tr><td>01001</td><td>1:4.7</td></tr> <tr><td>01010</td><td>1:5.7</td></tr> <tr><td>01011</td><td>1:6.7</td></tr> <tr><td>01100</td><td>1:8.0</td></tr> <tr><td>01101</td><td>1:9.5</td></tr> <tr><td>01110</td><td>1:11.3</td></tr> <tr><td>01111</td><td>1:13.5</td></tr> <tr><td>10000</td><td>1:16.0</td></tr> <tr><td>10001</td><td>1:19.0</td></tr> <tr><td>10010</td><td>1:22.8</td></tr> <tr><td>10011</td><td>1:27.0</td></tr> <tr><td>10100</td><td>1:32.0</td></tr> <tr><td>10101</td><td>1:37.9</td></tr> <tr><td>10110</td><td>1:45.5</td></tr> <tr><td>10111</td><td>1:53.9</td></tr> <tr><td>11000</td><td>1:64.0</td></tr> <tr><td>11001</td><td>1:75.0</td></tr> <tr><td>11010</td><td>1:91.0</td></tr> <tr><td>11011</td><td>1:108</td></tr> <tr><td>11100</td><td>1:128</td></tr> <tr><td>11101</td><td>1:152</td></tr> <tr><td>11110</td><td>1:182</td></tr> <tr><td>11111</td><td>1:215</td></tr> </tbody> </table>	RATIO	Ratio	00000	1:1 (Bypass)	00001	1:1.2	00010	1:1.4	00011	1:1.7	00100	1:2.0	00101	1:2.4	00110	1:2.8	00111	1:3.4	01000	1:4.0	01001	1:4.7	01010	1:5.7	01011	1:6.7	01100	1:8.0	01101	1:9.5	01110	1:11.3	01111	1:13.5	10000	1:16.0	10001	1:19.0	10010	1:22.8	10011	1:27.0	10100	1:32.0	10101	1:37.9	10110	1:45.5	10111	1:53.9	11000	1:64.0	11001	1:75.0	11010	1:91.0	11011	1:108	11100	1:128	11101	1:152	11110	1:182	11111	1:215

## 26.0 DAC Effects Registers

TABLE 66. DAC\_ALC\_1 (0xA0h)

Bits	Field	Description	
2:0	SAMPLE_RATE	This programs the timers on the ALC with the closest DAC sample rate.	
		SAMPLE_RATE	DAC Fs
		000	8kHz
		001	12kHz
		010	16kHz
		011	24kHz
		100	32kHz
		101	48kHz
		110	96kHz
111	192kHz		
3	LIMITER	If set, the circuit will never apply gain to the signal, no matter how small, but it will attenuate the signal as soon as it reaches target and release it at the decay rate, once signal level reduces below target. The I <sup>2</sup> C gain setting (at the time the LIMITER is enabled) is the maximum gain that the ALC will apply. Care should be taken when choosing the optimum I <sup>2</sup> C gain setting whenever enabling the Limiter.	
4	STEREO LINK	If set, the ALC circuit uses the stereo average of the input signals to control the gain of the stereo output. This maintains stereo imaging. If this bit is cleared, then both channels operate as dual mono.	

TABLE 67. DAC\_ALC\_2 (0xA1h)

Bits	Field	Description	
3:0	NOISE_FLOOR	This sets the anticipated noise floor. Signals lower than the specified noise floor will be gated from the ALC to avoid noise pumping.	
		NOISE_FLOOR	Noise Floor (dB)
		0000	-39
		0001	-42
		0010	-45
		0011	-48
		0100	-51
		0101	-54

TABLE 76. DAC\_3D (0xAAh)

Bits	Field	Description	
0	EFFECT_MODE	This sets the digital 3D stereo enhancement mode.	
		EFFECT_MODE	Type
		0	Loudspeaker
		1	Headphone
2:1	EFFECT_LEVEL	This sets the applied level of 3D effect.	
		EFFECT_LEVEL	Level
		00	25%
		01	37.50%
		10	50%
6:3	FILTER_TYPE	This sets the 3D effect filter response.	
		FILTER_TYPE	Response
		0000	200Hz HPF
		0001	300Hz HPF
		0010	600Hz HPF
		0011	900Hz HPF
		0100	200Hz-500Hz BPF
		0101	200Hz-1kHz BPF
		0110	200Hz-1.6kHz BPF
		0111	200Hz-2.5kHz BPF
		1000	300Hz-1kHz BPF
		1001	300Hz-1.6kHz BPF
		1010	300Hz-2.5kHz BPF
		1011	600Hz-1kHz BPF
		1100	600Hz-1.6kHz BPF
		1101	600Hz-2.5kHz BPF
1110	900Hz-1.6kHz BPF		
1111	900Hz-2.5kHz BPF		
7	ATTENUATE	If set, the inputs are reduced by 6dB before 3D effects are applied in order to avoid clipping.	

TABLE 77. EQ\_BAND\_1 (0xABh)

Bits	Field	Description	
1:0	FREQ	This sets the Sub-bass shelving filter's cut-off frequency.	
		FREQ	Frequency (Hz)
		00	60
		01	80
		10	100
		11	120
6:2	LEVEL	This sets the gain at $f_c$ .	
		LEVEL	Effect
		00000	Off (0dB)
		00001	-15dB
		00010	-14dB
		00011	-13dB
		00100	-12dB

11110	14dB		
11111	15dB		

TABLE 82. SOFTCLIP1 (0xB0h)

Bits	Field	Description	
3:0	TRESHOLD	This sets the threshold level of the audio compressor. Audio signals above the threshold will be compressed.	
		THRESHOLD	Threshold Level (dB)
		0000	-36dB
		0001	-30dB
		0010	-24dB
		0011	-20dB
		0100	-18dB
		0101	-17dB
		0110	-16dB
		0111	-15dB
		1000	-14dB
		1001	-12dB
		1010	-10dB
		1011	-8dB
		1100	-6dB
1101	-4dB		
1110	-2.5dB		
1111	-1dB		
4	SOFT_KNEE	If set, the audio compressor will automatically apply higher compression ratios to audio signals higher than the threshold level. As the audio signal approaches levels higher than the threshold, SOFT_KNEE will increase the compression RATIO. The highest compression that the SOFT_KNEE algorithm will apply is the compression that is set by RATIO.	

TABLE 83. SOFTCLIP2 (0xB1h)

Bits	Field	Description
4:0	RATIO	This sets the ratio at which the audio is compressed to when it passes beyond the threshold. In soft clip mode this is the final level of compression.
		RATIO      Ratio
		00000      1:1 (Bypass)
		00001      1:1.2
		00010      1:1.4
		00011      1:1.7
		00100      1:2.0
		00101      1:2.4
		00110      1:2.8
		00111      1:3.4
		01000      1:4.0
		01001      1:4.7
		01010      1:5.7
		01011      1:6.7
		01100      1:8.0
		01101      1:9.5
		01110      1:11.3
		01111      1:13.5
		10000      1:16.0
		10001      1:19.0
		10010      1:22.8
		10011      1:27.0
		10100      1:32.0
		10101      1:37.9
		10110      1:45.5
		10111      1:53.9
		11000      1:64
		11001      1:75.9
		11010      1:91.0
		11011      1:108
		11100      1:128
		11101      1:152
		11110      1:182
		11111      1:215

TABLE 84. SOFTCLIP3 (0xB2h)

Table 40:			
Bits	Field	Description	
4:0	LEVEL	This sets the post compressor gain level.	
		LEVEL	Level (dB)
		00000	-22.5dB
		00001	-21dB
		00010	-19.5dB
		00011	-18dB
		00100	-16.5dB
		00101	-15dB
		00110	-13.5dB

11011	18dB		
11100	19.5dB		
11101	21dB		
11110	22.5dB		
11111	24dB		

## 27.0 GPIO Registers

**TABLE 85. GPIO (0xE0h)**

Bits	Field	Description	
3:0	GPIO_MODE	This sets the mode of the GPIO Pin.	
		GPIO_MODE	GPIO Function
		0000	OFF (input disabled)
		0001	GPIO_RX
		0010	GPIO_TX
		0011	HP_ENB (out)
		0100	$\overline{\text{HP\_ENB}}$ (out)
		0101	LS_ENB (out)
		0110	$\overline{\text{LS\_ENB}}$ (out)
		0111	SHORT_CCT or THERMAL (out)
		1000	SHORT_CCT or THERMAL or CLIP (out)
		1001	CLIP (out)
		1010	ADC_NG_ACTIVE (out)
		1011	$\overline{\text{ADC\_NG\_ACTIVE}}$ (out)
		1100	MIC_MUTE (in)
1101	$\overline{\text{MIC\_MUTE}}$ (in)		
1110	CHIP_ENB (in)		
1111	$\overline{\text{CHIP\_ENB}}$ (in)		
4	GPIO_TX	If set, the GPIO pin will transmit a logic high whenever GPIO_MODE is set to '0010'.	
5	GPIO_RX	This bit reports what logic level is present on the GPIO pin.	
6	SHORT_CCT	If set, the GPIO records that a short circuit event has occurred on the class D outputs.	
7	THERMAL_EVENT	If set records that a temperature event has occurred on the die. Clear on Write (1).	

**TABLE 86. Spread Spectrum (0xF1h)**

Bits	Field	Description
1:0	RSVD	Reserved
2	SS_DISABLE	If this bit is set, Spread Spectrum mode will be disabled from the Class D amplifier.

**TABLE 87. ADC Compensation Filter C0 LSBs (0xF8h)**

Bits	Field	Description
7:0	ADC_CO_LSB	Bits 7:0 of C0[15:0]

**TABLE 88. ADC Compensation Filter C0 MSBs (0xF9h)**

Bits	Field	Description
7:0	ADC_CO_MSB	Bits 15:0 of C0[15:0]

**TABLE 89. ADC Compensation Filter C1 LSBs (0xFAh)**

Bits	Field	Description
7:0	ADC_C1_LSB	Bits 7:0 of C1[15:0]

**TABLE 90. ADC Compensation Filter C1 MSBs (0xFBh)**

Bits	Field	Description
7:0	ADC_C1_MSB	Bits 15:0 of C1[15:0]

**TABLE 91. ADC Compensation Filter C2 LSBs (0xFCb)**

Bits	Field	Description
7:0	ADC_C2_LSB	Bits 7:0 of C2[15:0]

**TABLE 92. ADC Compensation Filter C2 MSBs (0xFDh)**

Bits	Field	Description
7:0	ADC_C2_MSB	Bits 15:0 of C2[15:0]

**TABLE 93. AUX\_LINEOUT (0xFE)**

Bits	Field	Description
4:0	RSVD	Reserved
5	AUX_LINE_OUT	If set, the earpiece amplifier operates in a low current drive mode for line out applications in order to reduce power consumption.

## 29.0 Revision History

Rev	Date	Description
1.0	09/03/08	Initial release.
1.01	09/04/08	Text edits.
1.02	09/22/08	Text edits.
1.03	10/24/08	Text edits.
1.04	12/15/08	Text edits and replaced the top silkscreen layer.
1.05	05/27/09	Added the EMI/RFI section and the corresponding graphic.
1.06	05/29/09	Text edits.

#### LIFE SUPPORT POLICY

**NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION.** As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
