

High-Speed, Low Power CMOS 10-Bit Bus Switches

QS3L384

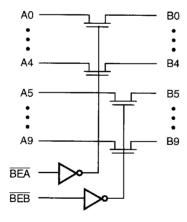

FEATURES/BENEFITS

- 5Ω switches connect inputs to outputs
- · Direct bus connection when switches on
- · Zero propagation delay
- Ultra low power with 0.2 μA typical lcc
- Two enables control five bits each
- Zero ground bounce
- Available in 24-pin DIP, SOIC (SO), QSOP and HQSOP

DESCRIPTION

The QS3L384 provides a set of ten high-speed CMOS TTL-compatible bus switches. The low ON resistance of the QS3L384 allows inputs to be connected to outputs without adding propagation delay and without generating additional ground bounce noise. The Bus Enable (\overline{BE}) signals turn the switches on. Two bus enable signals are provided, one for each of the upper and lower five bits of the two 10-bit buses.

DC ELECTRICAL CHARACTERISTICS OVER OPERATING RANGE

Commercial: $T_A = 0$ °C to 70°C, $V_{CC} = 5.0V \pm 5\%$

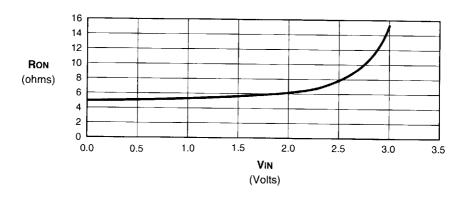

Military: $T_A = -55$ °C to 125°C, $V_{CC} = 5.0V \pm 10\%$

Ron	Switch ON Resistance(4,5)	Vcc = Min., Vin = 2.4V Ion = 15 mA	Com. Mil.	_	10 15	15 20	Ω

Notes:

- 1. Typical values indicate Vcc = 5.0V and $T_A = 25^{\circ}C$.
- 2. During input/output leakage, testing all pins are at a HIGH or LOW state, and the BE control is HIGH.
- 3. Not more than one output should be used to test this high power condition and the duration is ≤1 second.
- 4. Measured by voltage drop between A and B pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A,B) pins.
- 5. Max. value Ron guaranteed but not tested.

Typical ON Resistance vs VIN at 4.75 Vcc

POWER SUPPLY CHARACTERISTICS

Symbol	Parameter	Test Conditions ⁽¹⁾	Тур	Max	Unit
Icco	Quiescent Power Supply Current	Vcc = Max., Vin = GND or Vcc, f = 0	0.2	3.0	μΑ
Δίσο	Power Supply Current per Input HIGH ⁽²⁾	Vcc = Max., VIN = 3.4V, f = 0 per Control Input	_	2.5	mA
Qccd	Dynamic Power Supply Current per MHz ⁽³⁾	Vcc = Max., A and B Pins Open, Control Inputs Toggling @ 50% Duty Cycle		0.25	mA/ MHz

Notes:

- 1. For conditions shown as Min. or Max., use the appropriate values specified under DC specifications.
- 2. Per TTL driven input (VIN = 3.4V, control inputs only). A and B pins do not contribute to Icc.
- This current applies to the control inputs only and represents the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is guaranteed by design, but not tested.

Notes:

- See Test Circuit and Waveforms. Minimums guaranteed but not tested.
- 2. This parameter is guaranteed by design but not tested.
- 3. The time constant for the switch alone is of the order of 0.25 ns for 50 pF.
- 4. The bus switch contributes no propagation delay other than the RC delay of the ON resistance of the switch and the load capacitance. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
- 5. Measured at switch turn off, A to C, load = 50 pF in parallel with 10 meg scope probe, VIN at I = 0.0V.
- 6. Characterized parameter but not production tested.
