CLC952 12-bit, 41MSPS Monolithic A/D Converter

General Description

The CLC952 is a complete monolithic 12-bit 41MSPS analog-to-digital converter system. Fabricated from a 0.8µm BiCMOS process, the CLC952's on-chip features include a very linear wideband track-and-hold, bandgap voltage reference and a proprietary 12-bit multi-stage quantizer. The CLC952 has been designed for wideband digital communications receivers and features a 72dBc spurious-free dynamic range (SFDR) and 64dB signal-to-noise ratio (SNR).

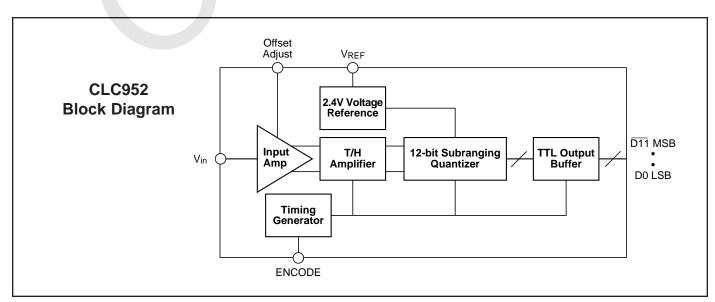

The CLC952 operates from a standard ±5V power supply and features excellent noise isolation with its >60dB power-supply rejection ratio (PSRR). All digital control functions and output registers are TTL compatible. The CLC952AC operates over the commercial temperature range (0°C to 70°C), and the CLC952AJ operates over the industrial temperature range (-40°C to 85°C) version. The CLC952 is available in a 28-pin SSOP that provides an extremely small footprint for reduced board space. National Semiconductor thoroughly tests each part to verify full compliance with guaranteed specifications.

Features

- 41MSPS
- Wide dynamic range SFDR: 72dBc SNR: 64dB
- Low power dissipation: 660mW
- Ground centered, DC-coupled analog input
- Excellent PSRR: >60dB
- Very small package: 28-pin SSOP
- Low cost

Applications

- Cellular base-stations
- Digital communications
- Infrared/CCD imaging
- IF sampling
- Electro-optics
- Instrumentation
- Medical imaging
- High definition video

CLC952 Electrical Characteristics (VCC = +5V, VEE = -5V, 40.96MSPS; unless specified)

Min/max ratings are based on product characterization and simulation. Individual parameters are tested as noted. Outgoing quality levels are determined from tested parameters.

Notes

These parameters are 100% tested at 25°C.
 Typical specifications are the mean values of Typical specifications are the mean values of the distributions of deliverable converters tested to date.

³⁾ Min/max data over temperature is based on the 5 sigma limit for deliverable converters tested to date.

⁴⁾ Full temperature range is 0°C to +70°C for AC, -40°C to +85°C for AJ.

Absolute Maximum Ratings

positive supply voltage (V_{CC}) -0.5V to +6V negative supply voltage (V_{EE}) +0.5V to -6V differential voltage between any two grounds <200mV analog input voltage range V_{EE} to V_{CC} -0.5V to +V_{CC} digital input voltage range output short circuit duration (one-pin to ground) infinite junction temperature 175°C storage temperature range -65°C to 150°C lead solder duration (+300°C) 10sec

Note: Absolute maximum ratings are limiting values, to be applied individually, and beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied. Exposure to maximum ratings for extended periods may affect device reliability.

Recommended Operating Conditions

positive supply voltage (V_{CC}) +5V ±5% negative supply voltage (V_{EE}) -5V ±5% differential voltage between any two grounds analog input voltage range ±0.5V operating temperature range (AC) 0°C to +70°C operating temperature range (AJ) -40°C to +85°C

CLC952 Pin Definitions

AGND	1			28	D11	(MSB INV)
AV_CC	2		2	27	D10	
AVEE	3		2	26	D9	
ENCODE	4		2	25	D8	
AVEE	5	CLC952	2	24	D7	
AGND	6		2	23	D6	
AVEE	7		2	22	D5	
AIN	8		2	21	D4	
Voffset	9		2	20	D3	
V_{REF}	10			19	D2	
AVEE	11			18	D1	
AVcc	12			17	D0	(LSB)
AGND	13			16	DGN	D
AVcc	14		-	15	DVc	

AGND (Pins 1, 6, 13) Analog circuit ground.

 AV_{CC} (Pins 2, 12, 14) +5V power supply for the analog section. Bypass to analog ground with a $0.1\mu F$ capacitor.

AV_{EE} (Pins 3, 5, 7,11) -5V power supply for the analog section. Bypass to analog ground with a $0.1\mu F$ capacitor.

ENCODE (Pin 4) ENCODE initiates a new data conversion cycle on each rising edge. Logic for this input is standard TTL. 50% duty cycle is recommended for full compliance with the guaranteed specifications.

AIN (Pin 8) Ground-centered, DC-coupled analog input with a 1V_{pp} maximum input range from -0.5V to

+0.5V. Analog input impedance is approximately 500Ω .

V_{OFFSET} (Pin 9) Voltage offset control. Sets the midpoint of the analog input range. Normally left floating. Ratio

of applied voltage to effective offset is 200:1. (1V applied to V_{OFFSET} produces 5mV midpoint offset.)

 V_{REF} (Pin 10) Internal voltage reference. Nominally +2.4V. V_{REF} can be pulled up or down with a voltage

source to program gain and input range. Bypass V_{RFF} to ground with a 0.1 μ F capacitor.

 DV_{CC} (Pin 15) +5V power supply for the digital section. Bypass to digital ground with a 0.1μF capacitor.

DGND (Pin 16) Digital ground.

 $\overline{D0-D11}$ (Pins 17-28) Digital data outputs are CMOS and TTL compatible. D0 is the LSB and $\overline{D11}$ is the MSB.

MSB is inverted. Output coding is two's complement.

Life Support Policy

National's products are not authorized for use as critical components in life support devices or systems without the express written approval of the president of National Semiconductor Corporation. As used herein:

- 1. Life support devices or systems are devices or systems which, a) are intended for surgical implant into the body, or b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- 2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
