

ThunderLAN™ TNETE100PM
PCI ETHERNET™ CONTROLLER WITH POWER MANAGEMENT
SINGLE-CHIP 10 BASE-T WITH MII FOR 100 BASE-T/100VG-AnyLAN

SPWS026 – OCTOBER 1996

- **Single-Chip Ethernet™ Controller for the Peripheral Component Interconnect (PCI) Local Bus**
 - 32-Bit PCI† Glueless Host Interface
 - Compliant With PCI Local-Bus Specification (Revision 2.1)
 - 0-MHz to 33-MHz Operation
 - 3-V or 5-V I/O Operation
 - Adaptive Performance Optimization™ (APO) by Texas Instruments (TI™) for Highest Available PCI Bandwidth
 - High-Performance Bus Master Architecture With Byte-Aligning Direct Memory Access (DMA) Controller for Low Host CPU and Bus Utilization
 - Plug-and-Play Compatible
- **Supports 32-Bit Data Streaming on PCI Bus**
 - Time-Division Multiplexed Static Random-Access Memory (SRAM)
 - 2-Gbps Internal Bandwidth
- **Driver Compatible With All Previous ThunderLAN™ Components**
- **Switched-Ethernet Compatible**
- **Full-Duplex Compatible**
 - Independent Transmit and Receive Channels
 - Two Transmit Channels for Demand Priority
- **Supports Multiple Protocols With a Single Driver Suite Optimized Shared Interrupts**
- **No On-Board Memory Required**
- **Auto-Negotiation (N-Way) Compatible**
- **Multimedia-Ready Architecture**
- **Supports the Card-Bus Card Information Structure (CIS) Pointer Register**
- **Early-Receive-Interrupt Count Register**
- **EEPROM Interface Supports Jumperless Design and Autoconfiguration**
- **Hardware Statistics Registers for Management-Information Base (MIB)**
- **Desktop Management Task Force (DMTF) Compatible**
- **Integrated 10 Base-T, and 10 Base-5 Attachment Unit Interface (AUI) Physical Layer Interface**
 - Single-Chip IEEE 802.3 and Blue Book Ethernet-Compliant Solution
 - DSP-Based Digital Phase-Locked Loop
 - Smart Squelch Allows for Transparent Link Testing
 - Transmission Waveshaping
 - Autopolarity (Reverse Polarity Correction)
 - External/Internal Loopback Including Twisted Pair and AUI
 - 10 Base-2 Supported Through AUI Interface
- **Media-Independent Interface (MII) for Connecting 100-Mbps External Transceivers**
 - Compliant MII for IEEE 802.3u Transceivers
 - Supports 100 Base-TX, 100 Base-T4, 100 Base-FX
 - Super Set Supports IEEE 802.12 Transceivers
 - Supports Ethernet and Token-Ring Framing Formats for 100VG-AnyLAN
 - Link-Pulse Detection for Determining Wire Rate
- **Low-Power CMOS Technology – Green PC Compatible**
- **Magic Packet™ Remote Wake-Up Scheme**
- **Microsoft™ Advanced Power Management**
 - PCI Specification Compatible for Low Power/Sleep Mode
 - Advanced Configuration and Power Interface (ACPI)
- **IEEE Standard 1149.1‡ Test-Access Port (JTAG)**
- **144-Pin Thin Quad Flat Packages and Quad Flat Packages (PCM and PGE)**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

† The PCI Local-Bus Specification, Revision 2.1 should be used as a reference with this document.

ThunderLAN™ TNETE100PM PCI ETHERNET™ CONTROLLER WITH POWER MANAGEMENT SINGLE-CHIP 10 BASE-T WITH MII FOR 100 BASE-T/100VG-AnyLAN

SPWS026 – OCTOBER 1996

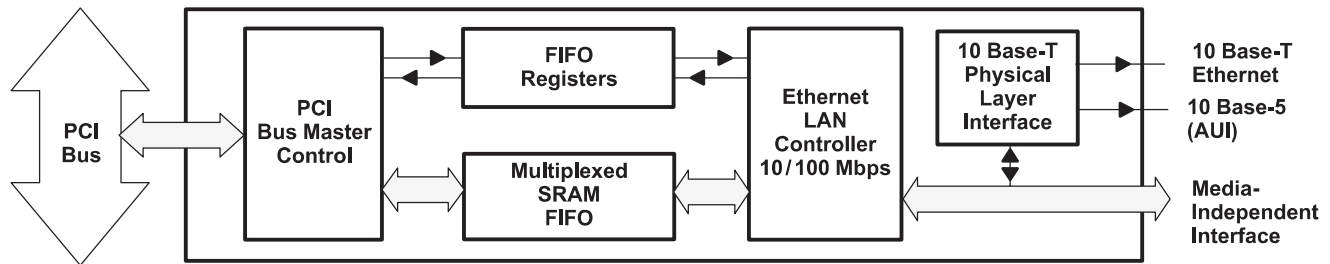

Figure 1. ThunderLAN Architecture

description

ThunderLAN is a high-speed networking architecture that provides a complete PCI-to-10 Base-T/AUI Ethernet solution with the flexibility to handle 100-Mbps Ethernet protocols as networking demands grow.

The TNETE100PM, an implementation of the ThunderLAN architecture (see Figure 1), is an intelligent-protocol network interface. The ThunderLAN SRAM FIFO-based architecture eliminates the need for external memory and offers a single-chip glueless PCI-to-10 Base-T/AUI (IEEE 802.3) solution with an on-board physical layer interface. Modular support for 100 Base-T (IEEE 802.3u) and 100VG-AnyLAN (IEEE 802.12) is provided by a superset of the industry-standard media-independent interface (MII). ThunderLAN uses a single driver suite to support multiple networking protocols.

The glueless PCI interface supports 32-bit streaming, operates at speeds up to 33 MHz, and is capable of internal data-transfer rates up to 2 Gbps, taking full advantage of all available PCI bandwidth. The TNETE100PM offers jumperless autoconfiguration using PCI configuration read/write cycles. Customizable configuration registers, which can be autoloading from an external serial EEPROM, allow designers of TNETE100PM-based systems to give their systems a unique identification code. The TNETE100PM PCI interface, developed in conjunction with other leaders in the semiconductor and computer industries, has been tested vigorously on multiple platforms to ensure compatibility across a wide array of available PCI products. In addition, the ThunderLAN drivers and ThunderLAN architecture use TI's patented Adaptive Performance Optimization (APO) technology to adjust critical parameters for minimum latency dynamically, minimum host CPU utilization, and maximum system performance. This technology ensures that the maximum capabilities of the PCI interface are used by automatically tuning the controller to the specific system in which it is operating.

The MII, an industry-standard interface for connecting a variety of external IEEE 802.3u physical layer interfaces, is supported fully by the TNETE100PM. In addition, the TNETE100PM features an IEEE 802.12-compliant superset of the MII to allow for support of 100VG-AnyLAN physical layer interfaces. This allows TNETE100PM-based systems to support 100 Base-TX, 100 Base-FX, 100 Base-T4, and 100VG-AnyLAN cabling schemes for maximum flexibility as each new physical layer interface becomes available in the marketplace.

An intelligent protocol handler (PH) implements the serial protocols of the network. The PH is designed for minimum overhead related to multiple protocols, using common state machines to implement 95% of the total protocol handler. On transmit, the PH serializes data, adds framing and cyclic redundancy check (CRC) fields, and interfaces to the network physical layer (PHY) chip. On receive, it provides address recognition, CRC and error-checking, frame disassembly, and deserialization. Data for multiple channels is passed to and from the PH by way of circular-buffer FIFOs in the FIFO SRAM.

ThunderLAN is the first multimedia-ready architecture and is capable of prioritizing data regardless of the selected protocol. The demand-priority protocol supports two priorities of frames: normal and priority. The two transmit channels provide independent host channels for these two frame types. Carrier-sense multiple access with collision detection (CSMA/CD) protocols only support a single priority of frame, but the two channels can be used to prioritize network access. All received frames pass through the single receive channel.

ThunderLAN™ TNETE100PM

PCI ETHERNET™ CONTROLLER WITH POWER MANAGEMENT

SINGLE-CHIP 10 BASE-T WITH MII FOR 100 BASE-T/100VG-AnyLAN

SPWS026 – OCTOBER 1996

description (continued)

Compliant with IEEE Standard 1149.1 (JTAG), the TNETE100PM provides a five-pin test-access port that is used for boundary-scan testing.

The TNETE100PM is available in a 144-pin thin quad flat package (TQFP) and quad flat package (QFP).

differences between TNETE100A and TNETE100PM

The TNETE100PM implements additional power management features such as Magic Packet and PCI specification 2.1 compatibility for low power/sleep mode, advanced configuration and power interface (ACPI).

SPWS026 – OCTOBER 1996

Pin Functions (Continued)

PIN NAME	NO.	TYPE†	DESCRIPTION
PCI INTERFACE (CONTINUED)			
PCLK	131	I	PCI clock. PCLK is the clock reference for all PCI bus operations. All other PCI pins except $\overline{\text{PRST}}$ and $\overline{\text{PINTA}}$ are sampled on the rising edge of PCLK. All PCI bus timing parameters are defined with respect to this edge.
$\overline{\text{PCLKRUN}}$	53	I/O‡	<p>Clock run control. Powerdown-enable-configuration. The $\overline{\text{PCLKRUN}}$ pin must be connected to the $\overline{\text{PRST}}$ signal for the system. This reset is generated by the V_{DD1} supply and, therefore, is used to put the TNETE100PM into D3off mode when SOPD = 1. When the $\overline{\text{PCLKRUN}}$ pin is asserted low, the TNETE100PM performs the following internal functions:</p> <ul style="list-style-type: none"> • Disables PCLK during sleep state • Puts all PCI outputs in high impedance mode asynchronously • Disables PFRAME# to ensure that the TNETE100PM is signaled that it is doing a PCI I/O cycle • Resets all TNETE100PM internal state machines • Disables all interrupts • Sets PowerState = 11b (only if SOPD = 1) • Stops the transmitter and receiver (destructive) <p>NOTE: Ten PCLK cycles are required for the TNETE100PM to terminate PCI operations and reset all state machines after $\overline{\text{PCLKRUN}}$ goes low.</p> <p>Clock run control. Clock-run-enable configuration. The $\overline{\text{PCLKRUN}}$ pin must be connected to the $\overline{\text{PCLKRUN}}$ signal of the system. $\overline{\text{PCLKRUN}}$ is the active-low PCI clock request/grant signal that allows the TNETE100PM to indicate when an active PCI clock is required. (This is an open drain.)</p>
PC/BE3 PC/BE2 PC/BE1 PC/BE0	2 16 28 41	I/O	PCI bus command and byte enables: PC/BE3 enables byte 3 (MSbyte) of the PCI address/data bus. PC/BE2 enables byte 2 of PCI address/data bus. PC/BE1 enables byte 1 of PCI address/data bus. PC/BE0 enables byte 0 (LSbyte) of PCI address/data bus.
$\overline{\text{PDEVSEL}}$	21	I/O	PCI device select. $\overline{\text{PDEVSEL}}$ indicates that the driving device has decoded one of its addresses as the target of the current access. The TNETE100PM drives $\overline{\text{PDEVSEL}}$ when it decodes an access to one of its registers. As a bus master, the TNETE100PM monitors $\overline{\text{PDEVSEL}}$ to detect accesses to illegal memory addresses.
$\overline{\text{PFRAME}}$	17	I/O	PCI cycle frame. $\overline{\text{PFRAME}}$ is driven by the active bus master to indicate the beginning and duration of an access. $\overline{\text{PFRAME}}$ is asserted to indicate the start of a bus transaction and remains asserted during the transaction, only being deasserted in the final data phase.
$\overline{\text{PGNT}}$	132	I	PCI bus grant. $\overline{\text{PGNT}}$ is asserted by the system arbiter to indicate that the TNETE100PM has been granted control of the PCI bus.
PIDSEL	4	I	PCI initialization device select. PIDSEL is the chip select for access to PCI configuration registers.
$\overline{\text{PINTA}}$	128	O/D	PCI interrupt. $\overline{\text{PINTA}}$ is the interrupt request from the TNETE100PM. PCI interrupts are shared, so this is an open-drain (wired-OR) output.
$\overline{\text{PIRDY}}$	19	I/O	PCI initiator ready. $\overline{\text{PIRDY}}$ is driven by the active bus master to indicate that it is ready to complete the current data phase of a transaction. A data phase is not completed until both $\overline{\text{PIRDY}}$ and $\overline{\text{PTRDY}}$ are sampled asserted. When the TNETE100PM is a bus master, it uses $\overline{\text{PIRDY}}$ to align incoming data on reads or outgoing data on writes with its internal RAM-access synchronization (maximum one cycle at the beginning of burst). When the TNETE100PM is a bus slave, it extends the access appropriately until both $\overline{\text{PIRDY}}$ and $\overline{\text{PTRDY}}$ are asserted.
$\overline{\text{PTRDY}}$	20	I/O	PCI target ready. $\overline{\text{PTRDY}}$ is driven by the selected device (bus slave or target) to indicate that it is ready to complete the current data phase of a transaction. A data phase is not completed until both $\overline{\text{PIRDY}}$ and $\overline{\text{PTRDY}}$ are sampled asserted. ThunderLAN uses $\overline{\text{PTRDY}}$ to ensure every direct I/O (DIO) operation is correctly interlocked.
PPAR	27	I/O	PCI parity. PPAR carries even parity across PAD[31:0] and PC/BE[3:0]. It is driven by the TNETE100PM during all address and write cycles as a bus master and during all read cycles as a bus slave.

† I = input, I/O = 3-state input/output, O/D = open-drain output

‡ Open drain

ThunderLAN™ TNETE100PM
PCI ETHERNET™ CONTROLLER WITH POWER MANAGEMENT
SINGLE-CHIP 10 BASE-T WITH MII FOR 100 BASE-T/100VG-AnyLAN

SPWS026 – OCTOBER 1996

Pin Functions (Continued)

PIN NAME	NO.	TYPE†	DESCRIPTION
PCI INTERFACE (CONTINUED)			
$\overline{\text{PPERR}}$	24	I/O	PCI parity error. $\overline{\text{PPERR}}$ indicates a data parity error on all PCI transactions except special cycles.
$\overline{\text{PREQ}}$	134	I/O	PCI bus request. $\overline{\text{PREQ}}$ is asserted by the TNETE100PM to request control of the PCI bus. This is not a shared signal.
$\overline{\text{PRST}}$	129	I	<p>PCI reset signal. Power-down-enable configuration. The $\overline{\text{PRST}}$ pin must be connected to a reset signal ($\overline{\text{VAUXGOOD}}$) by the auxiliary power supply. This pin resets the TNETE100PM on initial power up only. When $\overline{\text{PRST}}$ is asserted low, the TNETE100PM performs the following internal functions:</p> <ul style="list-style-type: none"> • Resets all TNETE100PM registers and state machines • Puts all PCI outputs (and IEEE standard JTAG pins) in high impedance mode asynchronously <p>PCI reset signal. Clock-run-enable configuration. The $\overline{\text{PRST}}$ pin should be connected to the $\overline{\text{PRST}}$ signal for the system. When $\overline{\text{PRST}}$ is asserted low, the TNETE100PM performs the following internal functions:</p> <ul style="list-style-type: none"> • Resets TNETE100PM registers and state machines • Puts all PCI outputs (and IEEE standard JTAG pins) in high impedance mode asynchronously
$\overline{\text{PSERR}}$	25	O/D	PCI system error. $\overline{\text{PSERR}}$ indicates parity errors or special cycle data parity errors.
$\overline{\text{PSTOP}}$	23	I/O	PCI stop. $\overline{\text{PSTOP}}$ indicates the current target is requesting the master to stop the current transaction.
BIOS ROM/LED DRIVER INTERFACE			
EAD7 EAD6 EAD5 EAD4 EAD3 EAD2 EAD1 EAD0	54 55 56 57 59 60 61 62	I/O	<p>EPROM address/data. EAD[7:0] is a multiplexed byte-bus that is used to address and read data from an external BIOS ROM.</p> <ul style="list-style-type: none"> • On the cycle when EXLE is asserted low, EAD[7:0] is driven with the high byte of the address. • On the cycle when EALE is asserted low, EAD[7:0] is driven with the low byte of the address. • When $\overline{\text{EOE}}$ is asserted, BIOS ROM data should be placed on the bus. <p>These pins also can be used to drive external-status LEDs. Low-current (2–5 mA) LEDs can be connected directly (through appropriate resistors). High-current LEDs can be driven through buffers or from the BIOS ROM address latches.</p>
EALE	65	O	EPROM address latch enable. EALE is driven low to latch the low (least significant) byte of the BIOS ROM address from EAD[0:7].
$\overline{\text{EOE}}$	64	O	EPROM output enable. When $\overline{\text{EOE}}$ is active (low), EAD[0:7] is in the high-impedance mode and the output of the BIOS ROM should be placed on EAD[0:7].
EXLE	66	O	EPROM extended address latch enable. EXLE is driven low to latch the high (most significant) byte of the BIOS ROM address from EAD[0:7].
CONFIGURATION EEPROM INTERFACE			
EDCLK	68	O	EEPROM data clock. EDCLK transfers serial clocked data to the 2K-bit serial EEPROMs (24C02) (see Note 1). EDCLK requires an external pullup for EEPROM operation.
EDIO	69	I/O	EEPROM data I/O. EDIO is the bidirectional serial data/address line to the 2K-bit serial EEPROM (24C02). EDIO requires an external pullup for EEPROM operation. Tying EDIO to ground disables the EEPROM interface and prevents autoconfiguration of the PCI configuration register.
MEDIA-INDEPENDENT INTERFACE (100-Mbps CSMA/CD AND DEMAND PRIORITY)			
MCOL	80	I	<p>Collision sense</p> <ul style="list-style-type: none"> • In CSMA/CD mode, assertion of MCOL indicates a network collision. • In demand-priority mode, MCOL (active low) is used to acknowledge a transmission request. The TNETE100PM begins frame transmission 50 MTCLK cycles after the assertion (low) of MCOL.

† I = input, O = output, I/O = 3-state input/output, O/D = open-drain output

Pin Functions (Continued)

PIN NAME	NO.	TYPE†	DESCRIPTION
MEDIA-INDEPENDENT INTERFACE (100-Mbps CSMA/CD AND DEMAND PRIORITY) (CONTINUED)			
MCRS	81	I	Carrier sense. MCRS indicates a frame-carrier signal is being received.
MDCLK	91	O	Management data clock. MDCLK is part of the serial management interface to physical-media independent (PMI)/PHY chip.
MDIO	93	I/O	Management data I/O. MDIO is part of the serial management interface to PMI/PHY chip.
MRCLK	82	I	Receive clock. MRCLK is the receive clock source from the attached PHY and PMI device.
MRST	95	O	MII reset. MRST is the reset signal to the PMI/PHY front-end (active low).
MRXD0	83	I	Receive data. MRXD[3:0] is the nibble-receive data from the physical-media dependent (PMD) front end. In demand-priority mode, ThunderLAN reads the frame priority of incoming frames on these pins on the cycle before assertion of MRXDV (the cycle before frame reception begins). <ul style="list-style-type: none"> MRXD1 indicates the transmission priority of the received frame. A value of zero indicates normal transmission, and a value of one indicates priority transmission. Data on these pins is always synchronous to MRCLK.
MRXD1	85		
MRXD2	86		
MRXD3	87		
MRXDV	89	I	Receive data valid. MRXDV indicates data on MRXD[3:0] is valid.
MRXER	90	I	Receive error. MRXER indicates reception of a coding error on received data.
MTCLK	71	I	Transmit clock. MTCLK is the transmit clock source from the attached PHY and PMI device.
MTXD0	72	O	Transmit data. MTXD[3:0] is the nibble-transmit data from TNETE100PM. When MTXEN is asserted, these pins carry transmit data. In demand-priority mode, the TNETE100PM drives the request state of the controller on these pins when MTXEN is not asserted (frame transmission not in progress). <ul style="list-style-type: none"> MTXD0 asserted indicates the TNETE100PM is requesting frame transmission. MTXD1 indicates the transmission priority required. A value of zero indicates normal transmission, and a value of one indicates high-priority transmission. Data on these pins is always synchronous to MTCLK.
MTXD1	73		
MTXD2	74		
MTXD3	76		
MTXER	78	O	Transmit error. MTXER allows coding errors to be propagated across the MII.
MTXEN	77	O	Transmit enable. MTXEN indicates valid transmit data on MTXD[3:0].
NETWORK INTERFACE (10 Base-T AND AUJ)			
ACOLN	111	A	AUI-receive pair. ACOLN and ACOLP are differential line receiver inputs and connect to receive pair through transformer isolation, etc.
ACOLP	109		
ARCVN	108	A	AUI-receive pair. ARCVN and ARCVP are differential line receiver inputs and connect to receive pair through transformer isolation, etc.
ARCVP	106		
AXMTP	99	A	AUI-transmit pair. AXMTP and AXMTN are differential line-transmitter outputs.
AXMTN	100		
FATEST	118	A	Analog test pin. FATEST provides access to the filter of the reference PLL. This pin must be left as a "no connect".
FIREF	116	A	Current reference. FIREF is used to set a current reference for the analog circuitry.
FONLY	120	A	Front-end only pin. The FONLY pin should be tied low for systems not requiring the power management capabilities of the TNETE100PM.
FRCVN	105	A	10 Base-T receive pair. FRCVN and FRCVP are differential line-receiver inputs and connect to receive pair through transformer isolation, etc.
FRCVP	103		
FXTL1	113	A	Crystal oscillator pins. FXTL1 is driven from a 20-MHz crystal oscillator module.
FXTL2	114		
FXMTP	97	A	10 Base-T transmit pair. FXMTP and FXMTN are differential line-transmitter outputs.
FXMTN	98		

† I = input, O = output, A = Analog

NOTE 1: This pin should be tied to V_{DD} with a 4.7-kΩ – 10-kΩ pullup resistor.

VSST	101	PWR	Analog power pin. Ground for transmitter circuitry
VSSVCO	119	PWR	Analog power pin. Ground for VCO and filter input

† PWR = power

architecture

The major blocks of the TNETE100PM include the PCI interface (PCIIF), protocol handler (PH), media independent interface (MII), physical layer (PHY), FIFO pointer registers (FPREGS), FIFO SRAM (FSRAM), and a test-access port (TAP). The functionality of these blocks is described in the following sections.

PCI interface (PCIIF)

The TNETE100PM PCIIF contains a byte-aligning DMA controller that allows frames to be fragmented into any byte length and transferred to any byte address while supporting 32-bit data streaming. For multipriority networks, it can provide multiple data channels, each with separate lists, commands, and status. Data for the channels is passed to and from the PH by way of circular buffer FIFOs in the SRAM, controlled through FIFO registers. The configuration EEPROM interface (CEI), BIOS ROM/LED driver interface (BRI), configuration and I/O memory registers (CIOREGS), and DMA controller are subblocks of the PCIIF. The features of these subblocks are described in the following subsections.

ADVANCE INFORMATION

ThunderLAN™ TNETE100PM PCI ETHERNET™ CONTROLLER WITH POWER MANAGEMENT SINGLE-CHIP 10 BASE-T WITH MII FOR 100 BASE-T/100VG-AnyLAN

SPWS026 – OCTOBER 1996

configuration EEPROM interface (CEI)

The CEI provides a means for autoconfiguration of the PCI configuration registers. Certain registers in the PCI configuration space can be loaded using the CEI. Autoconfiguration allows builders of TNETE100PM-based systems to customize the contents of these registers to identify their own system, rather than to use the TI defaults. The EEPROM is read at power up and can then be read from, and written to, under program control.

BIOS ROM/LED driver interface (BRI)

The BRI addresses and reads data from an external BIOS ROM through a multiplexed byte-wide bus. The ROM address/data pins also can be multiplexed to drive external status LEDs.

configuration and I/O memory registers (CIOREGS)

The CIOREGS reside in the configuration space, which is 256 bytes in length. The first 64 bytes of the configuration space comprise the header region, which is defined explicitly by the PCI standard.

DMA controller (DMAC)

The DMAC is responsible for coordinating TNETE100PM requests for mastership of the PCI bus. The DMAC provides byte-aligning DMA control, allowing byte-size fragmented frames to be transferred to any byte address while supporting 32-bit data streaming.

protocol handler (PH)

The PH implements the serial protocols of the network. On transmit, it serializes data, adds framing and CRC fields, and interfaces to the network PHY. On receive, it provides address recognition, CRC and error checking, frame disassembly, and deserialization. Data for multiple channels is passed to and from the PH by way of circular buffer FIFOs in the FSRAM controlled through FPREGS. The PH supports an MII that is compatible with the IEEE 802.12 and IEEE 802.3u logic.

media-independent interface (MII)

The MII provides both MAC-level 100 Base-T (IEEE 802.3u) and 100VG-AnyLAN (IEEE 802.12) controller functions to external PHY chips that handle the PHY functions for 100-Mbps CSMA/CD and demand priority. The MII also is used to communicate with the on-chip 10 Base-T PHY which is located at address 0x1F.

10 Base-T physical layer (PHY)

The PHY acts as an on-chip front-end providing physical layer functions for 10 Base-5 (AUI), 10 Base-2, and 10 Base-T (twisted pair). The PHY provides Manchester encoding/decoding from MII nibble-format data, smart squelch, jabber detection, link pulse detection, autopolarity control, 10 Base-T transmission waveshaping, and antialiasing filtering. Connection to the AUI drop cable for the 10 Base-T twisted pair is made through simple isolation transformers (see Figure 2) and no external filter networks are required. Suitable external termination components allow the use of either shielded or unshielded twisted-pair cable (150 Ω or 100 Ω). Some of the key features of the on-chip PHY are listed as follow:

- Integrated filters
- Integrated MII, including encoder/decoder
- 10 Base-T transceiver
- AUI transceiver
- 10 Base-2 transceiver
- Autopolarity (reverse polarity correction)
- Loopback for twisted pair and AUI
- Full-duplex mode for simultaneous 10 Base-T transmission and reception
- Low power

10 Base-T physical layer (PHY) (continued)

Figure 2. Schematic for 10 Base-T Network Interface Using TNETE100PM

FIFO pointer registers (FPREGS)

The FPREGS are used to implement circular buffer FIFOs in the SRAM. They are a collection of pointer and counter registers used to maintain the FIFO operation. Both the PCIIF and PH use FPREGS to determine where to read or write data in the SRAM and to determine how much data the FIFO contains. Unique receive and transmit FIFO registers are needed for each data channel supported.

FIFO SRAM (FSRAM)

The FSRAM is a conventional SRAM array accessed synchronously to the PCI bus clock. Access to the RAM is allocated on a time-division multiplexed (TDM) basis, rather than through a conventional shared bus. This removes the need for bus arbitration and provides ensured bandwidth. Half of the RAM accesses (every other cycle) are allocated to the PCI controller. It has a 64-bit access port to the RAM, giving it 1 Gbps of bandwidth, sufficient to support 32-bit data streaming on the PCI bus. The PH has one-quarter of the RAM accesses, and its port may be up to 64 bits wide. A 64-bit port for the PH provides 512 Mbps of bandwidth, more than sufficient for a full-duplex 100-Mbps network. The remaining RAM accesses can be allocated toward providing even more PH bandwidth. The RAM is accessible also (for diagnostic purposes) from the TNETE100PM internal data bus. Host DIO (mapped I/O) accesses are used by the host to access internal TNETE100PM registers and for controller test.

Features of the FSRAM include:

- 3.375K bytes of FSRAM
 - 1.5K-byte FIFO for receive
 - Two 0.75K-byte FIFOs for the two transmit channels
 - Three 128-byte lists
- In one-channel mode, the two transmit channels are combined, providing a single 1.5K-byte FIFO for a single transmit channel.

Supporting 1.5K bytes of FIFO per channel allows full-frame buffering of Ethernet frames. PCI latency is such that a minimum of 500 bytes of storage is required to support 100-Mbps LANs.

test-access port (TAP)

Compliant with IEEE Standard 1149.1, the TAP is composed of five pins that are used to interface serially with the device and the board on which it is installed for boundary-scan testing.

SPWS026 – OCTOBER 1996

absolute maximum ratings over operating case temperature range (unless otherwise noted)†

Supply voltage range, V_{DD} (see Note 2)	– 0.5 V to 7 V
Input voltage range (see Note 2)	– 0.5 V to 7 V
Output voltage range	– 0.5 V to 7 V
Power dissipation	TBD
Operating case temperature range, T_C	0°C to 95°C
Storage temperature range, T_{stg}	– 65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 2: Voltage values are with respect to V_{SS} , and all V_{SS} pins should be routed so as to minimize inductance to system ground.

The recommended operating conditions and the electrical characteristics tables are divided into groups, depending on pin function:

- PCI-interface pins
- Logic pins
- Physical-layer pins

The PCI signal pins are operated in one of two modes shown in the PCI tables.

- 5-V signal mode
- 3-V signal mode

recommended operating conditions (PCI-interface pins only) (see Note 3)

	3-V SIGNALING OPERATION			5-V SIGNALING OPERATION			UNIT	
	MIN	NOM	MAX	MIN	NOM	MAX		
V_{DD} Supply voltage (PCI)	3	3.3	3.6	4.75	5	5.25	V	
V_{IH} High-level input voltage	$0.5 \times V_{DD}$		$V_{DD} + 0.5$	2.0	$V_{DD} + 0.5$		V	
V_{IL} Low-level input voltage, TTL-level signal (see Note 4)	–0.5		$0.3 \times V_{DD}$	–0.5		0.8	V	
I_{OH} High-level output current	TTL outputs		–0.5		–2		mA	
I_{OL} Low-level output current (see Note 5)	TTL outputs		1.5		6		mA	
T_C Operating case temperature	0		95		0		95	°C
T_{stg} Storage temperature	– 65		150		– 65		150	°C

NOTES: 3. PCI interface pins include $\overline{PCLKRUN}$, \overline{PFRAME} , \overline{PTRDY} , \overline{PIRDY} , \overline{PSTOP} , $\overline{PDEVSEL}$, \overline{PIDSEL} , \overline{PPERR} , \overline{PSERR} , \overline{PREQ} , \overline{PGNT} , \overline{PCLK} , \overline{PPAR} , \overline{PRST} , \overline{PINTA} , $\overline{PAD}[31:0]$, and $\overline{PC/BE}[3:0]$.

4. The algebraic convention, where the more negative (less positive) limit is designated as a minimum, is used for logic-voltage levels only.

5. Output current of 2 mA is sufficient to drive five low-power Schottky TTL loads or ten advanced low-power Schottky TTL loads (worst case).

NOTE 4: The algebraic convention, where the more negative (less positive) limit is designated as a minimum, is used for logic-voltage levels only.

PARAMETER MEASUREMENT INFORMATION

Outputs are driven to a minimum high-logic level of 2.4 V and to a maximum low-logic level of 0.6 V. These levels are compatible with TTL devices.

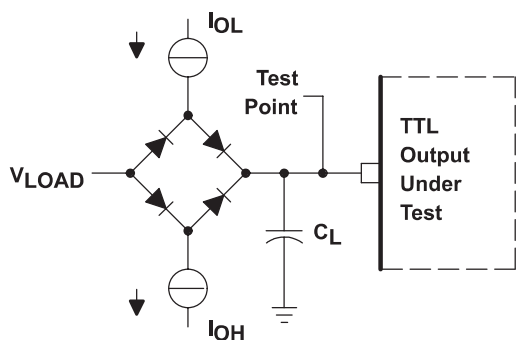

Output transition times are specified as follows: For a high-to-low transition on either an input or output signal, the level at which the signal is said to be no longer high is 2 V and the level at which the signal is said to be low is 0.8 V. For a low-to-high transition, the level at which the signal is said to be no longer low is 0.8 V and the level at which the signal is said to be high is 2 V, as shown below.

The rise and fall times are not specified but are assumed to be those of standard TTL devices, which are typically 1.5 ns.

test measurement

The test-load circuit shown in Figure 3 represents the programmable load of the tester pin electronics that are used to verify timing parameters of the TNETE100PM output signals.

(a) TTL OUTPUT TEST LOAD

(b) AXMTP AND AXMTN TEST LOAD (ac TESTING)
 X1 – Fil – Mag 23Z90 (1:1)

(c) FIREF TEST CIRCUIT

(d) FXMTP AND FXMTN TEST LOAD (ac TESTING)
 X2 – Fil – Mag 23Z128 (1:√2)

(e) FXMTP AND FXMTN TEST LOAD (dc TESTING)

Where: I_{OL} = Refer to I_{OL} in recommended operating conditions
 I_{OH} = Refer to I_{OH} in recommended operating conditions
 V_{LOAD} = 1.5 V, typical dc-level verification or
 0.7 V, typical timing verification
 C_L = 18 pF, typical load-circuit capacitance

SPWS026 – OCTOBER 1996

switching characteristics for 5-V and 3.3-V PCI (see Note 15 and Figure 4)

PARAMETER		MIN	MAX	UNIT
t_{VAL}	Delay time, PCLK to bused signals valid (see Notes 16 and 17)	2	11	ns
$t_{VAL}(PTP)$	Delay time, PCLK to bused signals valid point-to-point (see Notes 16 and 17)	2	12	ns
t_{on}	Float to active delay	2		ns
t_{off}	Active to float delay		28	ns

- NOTES: 15. Some of the timing symbols in this table are not currently listed with EIA or JEDEC standards for semiconductor symbology but are consistent with the PCI Local-Bus Specification, Revision 2.0.
16. Minimum times are measured with a 0-pF equivalent load; maximum times are measured with a 50-pF equivalent load. Actual test capacitance may vary, but results should be correlated to these specifications.
17. \overline{PREQ} and \overline{PGNT} are point-to-point signals and have different output-valid delay and input-setup times than do bused signals. \overline{PGNT} has a setup time of 10 ns; \overline{PREQ} has a setup time of 12 ns. All other signals are bused.

timing requirements for 5-V and 3.3-V PCI (see Note 15 and Figure 4)

		MIN	MAX	UNIT	
t_{su}	Setup time, bused signals valid to PCLK (see Note 17)	7		ns	
$t_{su}(PTP)$	Setup time to PCLK—point-to-point (see Note 17)	10, 12		ns	
t_h	Input hold time from PCLK	0		ns	
t_c	Cycle time, PCLK (see Note 18)	100 Mbps	30	50	ns
		10 Mbps	30	500	ns
$t_{w(H)}$	Pulse duration, PCLK high	11		ns	
$t_{w(L)}$	Pulse duration, PCLK low	11		ns	
t_{slew}	Slew rate, PCLK (see Note 19)	1	4	V/ns	

- NOTES: 15. Some of the timing symbols in this table are not currently listed with EIA or JEDEC standards for semiconductor symbology but are consistent with the PCI Local-Bus Specification, Revision 2.0.
17. \overline{PREQ} and \overline{PGNT} are point-to-point signals and have different output-valid delay and input-setup times than do bused signals. \overline{PGNT} has a setup time of 10 ns; \overline{PREQ} has a setup time of 12 ns. All other signals are bused.
18. As a requirement for frame transmission/reception, the minimum PCLK frequency varies with network speed. The clock may be stopped only in a low state.
19. Rise and fall times are specified in terms of the edge rate measured in V/ns. This slew rate must be met across the minimum peak-to-peak portion of the clock waveform.

ADVANCE INFORMATION

ThunderLAN™ TNETE100PM
 PCI ETHERNET™ CONTROLLER WITH POWER MANAGEMENT
 SINGLE-CHIP 10 BASE-T WITH MII FOR 100 BASE-T/100VG-AnyLAN

SPWS026 – OCTOBER 1996

MECHANICAL DATA

PGE (S-PQFP-G144)

PLASTIC QUAD FLATPACK

ADVANCE INFORMATION

4040147/B 10/94

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MO-136

POST OFFICE BOX 1443 • HOUSTON, TEXAS 77251-1443

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
