## FUNCTIONAL DESCRIPTION

The MC74AC563/74ACT563 contains eight D-type latches with 3-state complementary outputs. When the Latch Enable (LE) input is HIGH, data on the  $D_n$  inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW the latches store the information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The 3-state buffers are controlled by the Output Enable ( $\bar{OE}$ ) input. When  $\bar{OE}$  is LOW, the buffers are in the bi-state mode. When  $\bar{OE}$  is HIGH the buffers are in the high impedance mode but that does not interfere with entering new data into the latches.

**FUNCTION TABLE**
