DS92LV010A
Bus LVDS 3.3/5.0V Single Transceiver

General Description

The DS92LV010A is one in a series of transceivers designed specifically for the high speed, low power proprietary bus backplane interfaces. The device operates from a single 3.3V or 5.0V power supply and includes one differential line driver and one receiver. To minimize bus loading the driver outputs and receiver inputs are internally connected. The logic interface provides maximum flexibility as 4 separate lines are provided (DIN, DE, $\overline{RE}$, and ROUT). The device also features flow through which allows easy PCB routing for short stubs between the bus pins and the connector. The driver has 10 mA drive capability, allowing it to drive heavily loaded backplanes, with impedance as low as 27 Ohms.

The driver translates between TTL levels (single-ended) to Low Voltage Differential Signaling levels. This allows for high speed operation, while consuming minimal power with reduced EMI. In addition the differential signaling provides common mode noise rejection of ±1V.

The receiver threshold is ±100mV over a ±1V common mode range and translates the low voltage differential levels to standard (CMOS/TTL) levels.

Features

- Bus LVDS Signaling (BLVDS)
- Designed for Double Termination Applications
- Balanced Output Impedance
- Lite Bus Loading 5pF typical
- Glitch free power up/down (Driver disabled)
- 3.3V or 5.0V Operation
- ±1V Common Mode Range
- ±100mV Receiver Sensitivity
- High Signaling Rate Capability (above 100 Mbps)
- Low Power CMOS design
- Product offered in 8 lead SOIC package
- Industrial Temperature Range Operation

Note 1: "Absolute Maximum Ratings" are these beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

Note 2: All currents into device pins are positive; all currents out of device pins are negative. All voltages are referenced to device ground except V_{OD}, V_{ID}, V_{TH} and V_{TL} unless otherwise specified.

Note 3: All typicals are given for V_{CC} = +3.3V or 5.0 V and T_A = +25°C, unless otherwise stated.

Note 4: ESD Rating: HBM (1.5 kΩ, 100 pF) > 2.0 kV EAT (0Ω, 200 pF) > 300V.

Note 5: C_L includes probe and fixture capacitance.

Note 6: Generator waveforms for all tests unless otherwise specified: f = 1MHz, ZO = 50Ω, tr, tf ≤ 6.0ns (0%–100%) on control pins and ≤ 1.0ns for RI inputs.

Note 7: The DS92LV010A is a current mode device and only function with datasheet specification when a resistive load is applied between the driver outputs.

Note 8: For receiver TRI-STATE® delays, the switch is set to V_{CC} for t_{PZL}, and t_{PLZ} and to GND for t_{PZH}, and t_{PHZ}.

Application Information

There are a few common practices which should be implied when designing PCB for BLVDS signaling. Recommended practices are:

- Use at least 4 layer PCB board (BLVDS signals, ground, power and TTL signals).
- Keep drivers and receivers as close to the (BLVDS port side) connector as possible.
- Bypass each BLVDS device and also use distributed bulk capacitance. Surface mount capacitors placed close to power and ground pins work best. Two or three multi-layer ceramic (MLC) surface mount capacitors (0.1 µF, and 0.01 µF in parallel should be used between each V_{CC} and ground. The capacitors should be as close as possible to the V_{CC} pin.
- Use the termination resistor which best matches the differential impedance of your transmission line.
- Leave unused LVDS receiver inputs open (floating)
