
PART NUMBER**TP80C51FA-ROCA**

Rochester Electronics**Manufactured Components**

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All re-creations are done with the approval of the Original Component Manufacturer. (OCM)

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-38535
 - Class Q Military
 - Class V Space Level

Qualified Suppliers List of Distributors (QSLD)

- Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OCM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

8XC51FX

CHMOS Single-Chip 8-Bit Microcontrollers

The Intel 87C51FA/8XC51FB/8XC51FC is a single-chip control oriented microcontroller which is fabricated on Intel's reliable CHMOS III-E technology. The Intel 83C51FA/80C51FA is fabricated on CHMOS III technology. Being a member of the MCS 51 controller family, the 8XC51FA/8XC51FB/8XC51FC uses the same powerful instruction set, has the same architecture, and is pin-for-pin compatible with the existing MCS 51 controller products. The 8XC51FA/8XC51FB/8XC51FC is an enhanced version of the 8XC52/8XC54/8XC58. Its added features make it an even more powerful microcontroller for applications that require Pulse Width Modulation, High Speed I/O and up/down counting capabilities such as motor control.

PRELIMINARY

8XC51FX CHMOS SINGLE-CHIP 8-BIT MICROCONTROLLERS

Commercial/Express

87C51FA/83C51FA/80C51FA/87C51FB/83C51FB/87C51FC/83C51FC

*See Table 1 for Proliferation Options

- High Performance CHMOS EPROM/ROM/CPU
- 12/24/33 MHz Operation
- Three 16-Bit Timer/Counters
- Programmable Counter Array with:
 - High Speed Output,
 - Compare/Capture,
 - Pulse Width Modulator,
 - Watchdog Timer Capabilities
- Up/Down Timer/Counter
- Three Level Program Lock System
- 8K/16K/32K On-Chip Program Memory
- 256 Bytes of On-Chip Data RAM
- Improved Quick Pulse Programming Algorithm
- Boolean Processor
- 32 Programmable I/O Lines
- 7 Interrupt Sources
- Four Level Interrupt Priority
- Programmable Serial Channel with:
 - Framing Error Detection
 - Automatic Address Recognition
- TTL Compatible Logic Levels
- 64K External Program Memory Space
- 64K External Data Memory Space
- MCS® 51 Controller Compatible Instruction Set
- Power Saving Idle and Power Down Modes
- ONCE (On-Circuit Emulation) Mode
- Extended Temperature Range Except for 33 MHz Offering (–40°C to +85°C)

MEMORY ORGANIZATION

ROM Device	EPROM Version	ROMLESS Version	ROM/ EPROM Bytes	RAM Bytes
83C51FA	87C51FA	80C51FA	8K	256
83C51FB	87C51FB	80C51FA	16K	256
83C51FC	87C51FC	80C51FA	32K	256

These devices can address up to 64 Kbytes of external program/data memory.

The Intel 87C51FA/8XC51FB/8XC51FC is a single-chip control oriented microcontroller which is fabricated on Intel's reliable CHMOS III-E technology. The Intel 83C51FA/80C51FA is fabricated on CHMOS III technology. Being a member of the MCS® 51 controller family, the 8XC51FA/8XC51FB/8XC51FC uses the same powerful instruction set, has the same architecture, and is pin-for-pin compatible with the existing MCS 51 controller products. The 8XC51FA/8XC51FB/8XC51FC is an enhanced version of the 8XC52/8XC54/8XC58. Its added features make it an even more powerful microcontroller for applications that require Pulse Width Modulation, High Speed I/O and up/down counting capabilities such as motor control.

For the remainder of this document, the 8XC51FA, 8XC51FB, 8XC51FC will be referred to as the 8XC51FX, unless information applies to a specific device.

PROCESS INFORMATION

The 87C51FA/8XC51FB/8XC51FC is manufactured on P629.0, a CHMOS III-E process. Additional process and reliability information is available in the *Intel® Quality System Handbook*: <http://developer.intel.com/design/quality/quality.htm>

PACKAGES

Part	Package Type
8XC51FX	40-Pin Plastic DIP 40-Pin Cerdip 44-Pin PLCC 44-Pin QFP

Figure 2. Pin Connections

PIN DESCRIPTIONS

V_{CC} : Supply voltage.

V_{SS} : Circuit ground.

V_{SS1} : Secondary ground (not on DIP devices or any 83C51FA/80C51FA device). Provided to reduce ground bounce and improve power supply by-passing.

NOTE:

This pin is not a substitution for the V_{SS} pin. (Connection not necessary for proper operation.)

Port 0: Port 0 is an 8-bit, open drain, bidirectional I/O port. As an output port each pin can sink several LS TTL inputs. Port 0 pins that have 1's written to them float, and in that state can be used as high-impedance inputs.

Port 0 is also the multiplexed low-order address and data bus during accesses to external Program and Data Memory. In this application it uses strong internal pullups when emitting 1's, and can source and sink several LS TTL inputs.

Port 0 also receives the code bytes during EPROM programming, and outputs the code bytes during program verification. External pullup resistors are required during program verification.

Port 1: Port 1 is an 8-bit bidirectional I/O port with internal pullups. The Port 1 output buffers can drive LS TTL inputs. Port 1 pins that have 1's written to them are pulled high by the internal pullups, and in that state can be used as inputs. As inputs, Port 1 pins that are externally pulled low will source current (I_{IL} , on the data sheet) because of the internal pullups.

In addition, Port 1 serves the functions of the following special features of the 8XC51FX:

Port Pin	Alternate Function
P1.0	T2 (External Count Input to Timer/Counter 2), Clock Out
P1.1	T2EX (Timer/Counter 2 Capture/Reload Trigger and Direction Control)
P1.2	ECI (External Count Input to the PCA)
P1.3	CEX0 (External I/O for Compare/Capture Module 0)
P1.4	CEX1 (External I/O for Compare/Capture Module 1)
P1.5	CEX2 (External I/O for Compare/Capture Module 2)
P1.6	CEX3 (External I/O for Compare/Capture Module 3)
P1.7	CEX4 (External I/O for Compare/Capture Module 4)

Port 1 receives the low-order address bytes during EPROM programming and verifying.

Port 2: Port 2 is an 8-bit bidirectional I/O port with internal pullups. The Port 2 output buffers can drive LS TTL inputs. Port 2 pins that have 1's written to them are pulled high by the internal pullups, and in that state can be used as inputs. As inputs, Port 2 pins that are externally pulled low will source current (I_{IL} , on the data sheet) because of the internal pullups.

Port 2 emits the high-order address byte during fetches from external Program Memory and during accesses to external Data Memory that use 16-bit addresses (MOVX @DPTR). In this application it uses strong internal pullups when emitting 1's. During accesses to external Data Memory that use 8-bit addresses (MOVX @Ri), Port 2 emits the contents of the P2 Special Function Register.

Some Port 2 pins receive the high-order address bits during EPROM programming and program verification.

Port 3: Port 3 is an 8-bit bidirectional I/O port with internal pullups. The Port 3 output buffers can drive LS TTL inputs. Port 3 pins that have 1's written to them are pulled high by the internal pullups, and in that state can be used as inputs. As inputs, Port 3 pins that are externally pulled low will source current (I_{IL} , on the data sheet) because of the pullups.

Port 3 also serves the functions of various special features of the MCS-51 Family, as listed below:

Port Pin	Alternate Function
P3.0	RXD (serial input port)
P3.1	TXD (serial output port)
P3.2	$\overline{\text{INT0}}$ (external interrupt 0)
P3.3	$\overline{\text{INT1}}$ (external interrupt 1)
P3.4	T0 (Timer 0 external input)
P3.5	T1 (Timer 1 external input)
P3.6	$\overline{\text{WR}}$ (external data memory write strobe)
P3.7	$\overline{\text{RD}}$ (external data memory read strobe)

RST: Reset input. A high on this pin for two machine cycles while the oscillator is running resets the device. The port pins will be driven to their reset condition when a minimum V_{IH1} voltage is applied whether the oscillator is running or not. An internal pull-down resistor permits a power-on reset with only a capacitor connected to V_{CC} .

ALE: Address Latch Enable output pulse for latching the low byte of the address during accesses to external memory. This pin (ALE/PROG) is also the program pulse input during EPROM programming for the 87C51FX.

In normal operation ALE is emitted at a constant rate of $\frac{1}{6}$ the oscillator frequency, and may be used for external timing or clocking purposes. Note, however, that one ALE pulse is skipped during each access to external Data Memory.

If desired, ALE operation can be disabled by setting bit 0 of SFR location 8EH. With this bit set, the pin is weakly pulled high. However, the ALE disable feature will be suspended during a MOVX or MOVC instruction, idle mode, power down mode and ICE mode. The ALE disable feature will be terminated by reset. When the ALE disable feature is suspended or terminated, the ALE pin will no longer be pulled up weakly. Setting the ALE-disable bit has no affect if the microcontroller is in external execution mode.

Throughout the remainder of this data sheet, ALE will refer to the signal coming out of the ALE/ $\overline{\text{PROG}}$ pin, and the pin will be referred to as the ALE/ $\overline{\text{PROG}}$ pin.

PSEN: Program Store Enable is the read strobe to external Program Memory.

When the 8XC51FX is executing code from external Program Memory, $\overline{\text{PSEN}}$ is activated twice each machine cycle, except that two $\overline{\text{PSEN}}$ activations are skipped during each access to external Data Memory.

$\overline{\text{EA}}/\overline{\text{VPP}}$: External Access enable. $\overline{\text{EA}}$ must be strapped to VSS in order to enable the device to fetch code from external Program Memory locations 0000H to 0FFFH. Note, however, that if either of the Program Lock bits are programmed, $\overline{\text{EA}}$ will be internally latched on reset.

$\overline{\text{EA}}$ should be strapped to V_{CC} for internal program executions.

This pin also receives the programming supply voltage (V_{PP}) during EPROM programming.

XTAL1: Input to the inverting oscillator amplifier.

XTAL2: Output from the inverting oscillator amplifier.

OSCILLATOR CHARACTERISTICS

XTAL1 and XTAL2 are the input and output, respectively, of a inverting amplifier which can be configured for use as an on-chip oscillator, as shown in Figure 3. Either a quartz crystal or ceramic resonator may be used. More detailed information concerning the use of the on-chip oscillator is available in Application Note AP-155, "Oscillators for Microcontrollers."

To drive the device from an external clock source, XTAL1 should be driven, while XTAL2 floats, as shown in Figure 4. There are no requirements on the duty cycle of the external clock signal, since the input to the internal clocking circuitry is through a divide-by-two flip-flop, but minimum and maximum high and low times specified on the data sheet must be observed.

An external oscillator may encounter as much as a 100 pF load at XTAL1 when it starts up. This is due to interaction between the amplifier and its feedback capacitance. Once the external signal meets the V_{IL} and V_{IH} specifications the capacitance will not exceed 20 pF.

Figure 3. Oscillator Connections

Figure 4. External Clock Drive Configuration

IDLE MODE

The user's software can invoke the Idle Mode. When the microcontroller is in this mode, power consumption is reduced. The Special Function Registers and the onboard RAM retain their values during Idle, but the processor stops executing instructions. Idle Mode will be exited if the chip is reset or if an enabled interrupt occurs. The PCA timer/counter can optionally be left running or paused during Idle Mode.

POWER DOWN MODE

To save even more power, a Power Down mode can be invoked by software. In this mode, the oscillator is stopped and the instruction that invoked Power

Down is the last instruction executed. The on-chip RAM and Special Function Registers retain their values until the Power Down mode is terminated.

On the 8XC51FX either hardware reset or external interrupt can cause an exit from Power Down. Reset redefines all the SFRs but does not change the on-chip RAM. An external interrupt allows both the SFRs and the on-chip RAM to retain their values.

To properly terminate Power Down the reset or external interrupt should not be executed before V_{CC} is restored to its normal operating level and must be held active long enough for the oscillator to restart and stabilize (normally less than 10 ms).

With an external interrupt, INT0 or INT1 must be enabled and configured as level-sensitive. Holding the pin low restarts the oscillator but bringing the pin back high completes the exit. Once the interrupt is serviced, the next instruction to be executed after RETI will be the one following the instruction that put the device into Power Down.

DESIGN CONSIDERATION

- Ambient light is known to affect the internal RAM contents during operation. If the 87C51FX application requires the part to be run under ambient lighting, an opaque label should be placed over the window to exclude light.
- When the idle mode is terminated by a hardware reset, the device normally resumes program execution, from where it left off, up to two machine cycles before the internal reset algorithm takes control. On-chip hardware inhibits access to internal RAM in this event, but access to the port pins is not inhibited. To eliminate the possibility of an unexpected write when Idle is terminated by reset, the instruction following the one that invokes Idle should not be one that writes to a port pin or to external memory.

Table 2. Status of the External Pins during Idle and Power Down

Mode	Program Memory	ALE	$\overline{\text{PSEN}}$	PORT0	PORT1	PORT2	PORT3
Idle	Internal	1	1	Data	Data	Data	Data
Idle	External	1	1	Float	Data	Address	Data
Power Down	Internal	0	0	Data	Data	Data	Data
Power Down	External	0	0	Float	Data	Data	Data

NOTE:

For more detailed information on the reduced power modes refer to current Embedded Microcontrollers and Processors Handbook Volume I, and Application Note AP-252 (Embedded Applications Handbook), "Designing with the 80C51BH."

ONCE MODE

The ONCE ("On-Circuit Emulation") Mode facilitates testing and debugging of systems using the 8XC51FX without the 8XC51FX having to be removed from the circuit. The ONCE Mode is invoked by:

- 1) Pull ALE low while the device is in reset and PSEN is high;
- 2) Hold ALE low as RST is deactivated.

While the device is in ONCE Mode, the Port 0 pins float, and the other port pins and ALE and PSEN are weakly pulled high. The oscillator circuit remains active. While the 8XC51FX is in this mode, an emulator or test CPU can be used to drive the circuit. Normal operation is restored when a normal reset is applied.

8XC51FX EXPRESS

The Intel EXPRESS system offers enhancements to the operational specifications of the MCS-51 family of microcontrollers. These EXPRESS products are designed to meet the needs of those applications whose operating requirements exceed commercial standards.

The EXPRESS program includes the commercial standard temperature range with burn-in and an extended temperature range with or without burn-in.

With the commercial standard temperature range, operational characteristics are guaranteed over the temperature range of 0°C to 70 °C. With the extended temperature range option, operational characteristics are guaranteed over the range of 40°C to a 85°C.

The optional burn-in is dynamic for a minimum time of 168 hours at 125°C with VCC = 6.9V ± 0.25V, following guidelines in MIL-STD-883, Method 1015.

For the extended temperature range option, this data sheet specifies the parameters which deviate from their commercial temperature range limits.

NOTE:

Intel offers Express Temperature specifications for all 8XC51FX speed options except for 33 MHz.

Table 3. Package Identification

Package Type	Temperature Range	Burn-In
Cerdip	Commercial	No
PLCC	Commercial	No
Plastic	Commercial	No
QFP	Commercial	No
Cerdip	Extended	Yes
PLCC	Extended	Yes
Plastic	Extended	Yes
QFP	Extended	Yes
Cerdip	Extended	No
PLCC	Extended	No
Plastic	Extended	No
QFP	Extended	No

ABSOLUTE MAXIMUM RATINGS*

Ambient Temperature Under Bias ..- 40°C to + 85°C
 Storage Temperature..... - 65°C to +150°C
 Voltage on EA/V_{PP} Pin to V_{SS}.....0V to + 13.0V
 Voltage on Any Other Pin to V_{SS} ... - 0.5V to + 6.5V
 I_{OL} per I/O Pin..... 15mA
 Power Dissipation..... 1.5W
 (based on PACKAGE heat transfer limitations, not device power consumption)

NOTICE: This data sheet contains preliminary information on new products in production. It is valid for the devices indicated in the revision history. The specifications are subject to change without notice.

* **WARNING:** *Stressing the device beyond the Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.*

OPERATING CONDITIONS

NOTES:

1. Capacitive loading on Ports 0 and 2 may cause noise pulses above 0.4V to be superimposed on the V_{OL} s of ALE and Ports 1, 2 and 3. The noise is due to external bus capacitance discharging into the Port 0 and Port 2 pins when these pins change from 1 to 0. In applications where capacitance loading exceeds 100 pF, the noise pulses on these signals may exceed 0.8V. It may be desirable to qualify ALE or other signals with a Schmitt Trigger, or CMOS-level input logic.

2. Capacitive loading on Ports 0 and 2 cause the V_{OH} on ALE and PSEN to drop below the 0.9 V_{CC} specification when the address lines are stabilizing.

3. See Figures 6±9 for test conditions. Minimum V_{CC} for power down is 2V.

4. Typicals are based on limited number of samples, and are not guaranteed. The values listed are at room temperature and 5V.

5. Under steady state (non-transient) conditions, I_{OL} must be externally limited as follows:

- Maximum I_{OL} per port pin: 10 mA
- Maximum I_{OL} per 8-bit port -

- Port 0: 26 mA
- Ports 1, 2, and 3: 15 mA
- Maximum total I_{OL} for all output pins: 71 mA

If I_{OL} exceeds the test condition, V_{OL} may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.

NOTE:

I_{CC} max at 33 MHz is at $5V \pm 10\% V_{CC}$, while I_{CC} max at 24 MHz and below is at $5V \pm 20\% V_{CC}$.

Figure 5. 8XC51FA/FB/FC I_{CC} vs Frequency

Figure 6. I_{CC} Test Condition, Active Mode

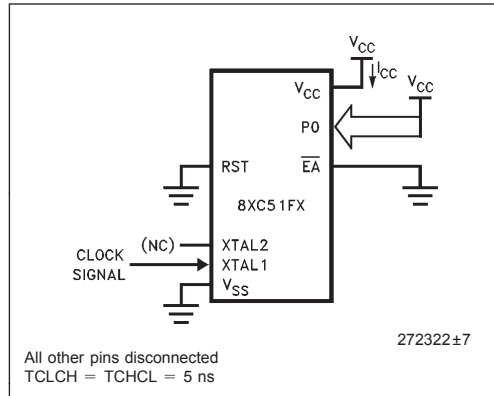

Figure 7. I_{CC} Test Condition Idle Mode

Figure 8. I_{CC} Test Condition, Power Down Mode.
 $V_{CC} = 2.0V$ to $6.0V$.

Figure 9. Clock Signal Waveform for I_{CC} Tests in Active and Idle Modes. TCLCH = TCHCL = 5 ns.

EXPLANATION OF THE AC SYMBOLS

Each timing symbol has 5 characters. The first character is always a 'T' (stands for time). The other characters, depending on their positions, stand for the name of a signal or the logical status of that signal. The following is a list of all the characters and what they stand for.

- A: Address
- C: Clock
- D: Input Data
- H: Logic level HIGH
- I: Instruction (program memory contents)

- L: Logic level LOW, or ALE
- P: $\overline{\text{PSEN}}$
- Q: Output Data
- R: $\overline{\text{RD}}$ signal
- T: Time
- V: Valid
- W: $\overline{\text{WR}}$ signal
- X: No longer a valid logic level
- Z: Float

For example,

- TAVLL = Time from Address Valid to ALE Low
- TLLPL = Time from ALE Low to $\overline{\text{PSEN}}$ Low

AC CHARACTERISTICS (Over Operating Conditions, Load Capacitance for Port 0, ALE/ $\overline{\text{PROG}}$ and $\overline{\text{PSEN}}$ = 100 pF, Load Capacitance for All Other Outputs = 80 pF)

EXTERNAL MEMORY CHARACTERISTICS

All parameter values apply to all devices unless otherwise indicated. In this table, 8XC51FX refers to 8XC51FX, 8XC51FX-1 and 8XC51FX-2.

Symbol	Parameter	Oscillator							Units	
		12 MHz		24 MHz		33 MHz		Variable		
		Min	Max	Min	Max	Min	Max	Min		Max
1/TCLCL	Oscillator Frequency 8XC51FX 8XC51FX-1 8XC51FX-2 8XC51FX-24 8XC51FX-33							3.5 3.5 0.5 3.5 3.5	12 16 12 24 33	MHz

PROGRAMMING THE EPROM/OTP

To be programmed, the part must be running with a 4 to 6 MHz oscillator. (The reason the oscillator needs to be running is that the internal bus is being used to transfer address and program data to appropriate internal EPROM locations.) The address of an EPROM location to be programmed is applied to Port 1 and pins P2.0 - P2.4 of Port 2, while the code byte to be programmed into that location is applied to Port 0. The other Port 2 and 3 pins, RST, PSEN, and \overline{EA}/V_{PP} should be held at the "Program" levels indicated in Table 4. ALE/PROG is pulsed low to program the code byte into the addressed EPROM location. The setup is shown in Figure 10.

Normally \overline{EA}/V_{PP} is held at logic high until just before ALE/PROG is to be pulsed. Then \overline{EA}/V_{PP} is raised to V_{PP} , ALE/PROG is pulsed low, and then \overline{EA}/V_{PP} is returned to a valid high voltage. The voltage on the \overline{EA}/V_{PP} pin must be at the valid \overline{EA}/V_{PP} high level before a verify is attempted. Waveforms and detailed timing specifications are shown in later sections of this data sheet.

NOTE:

- \overline{EA}/V_{PP} pin must not be allowed to go above the maximum specified V_{PP} level for any amount of time. Even a narrow glitch above that voltage level can cause permanent damage to the device. The V_{PP} source should be well regulated and free of glitches.

Table 4. EPROM Programming Modes

Mode	RST	PSEN	ALE/PROG	\overline{EA}/V_{PP}	P2.6	P2.7	P3.3	P3.6	P3.7

Read Signature Byte	H	L	H	H	L	L	L	L	L

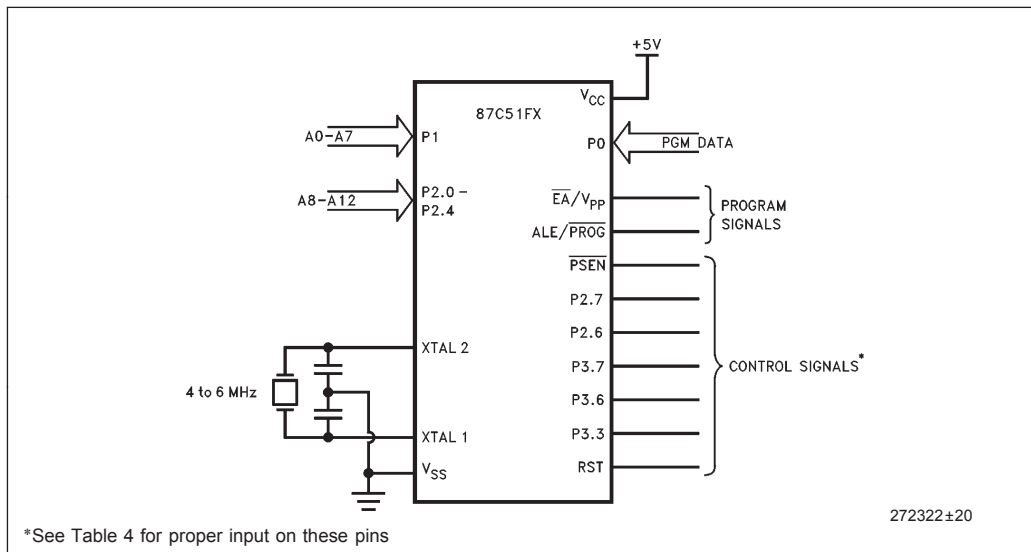

Figure 10. Programming the EPROM

PROGRAMMING ALGORITHM

Refer to Table 4 and Figures 10 and 11 for address, data, and control signals set up. To program the 87C51FX the following sequence must be exercised.

1. Input the valid address on the address lines.
2. Input the appropriate data byte on the data lines.
3. Activate the correct combination of control signals.
4. Raise \overline{EA}/V_{PP} from V_{CC} to $12.75V \pm 0.25V$.
5. Pulse, ALE/\overline{PROG} 5 times for the EPROM array, and 25 times for the encryption table and the lock bits.

Repeat 1 through 5 changing the address and data for the entire array or until the end of the object file is reached.

PROGRAM VERIFY

Program verify may be done after each byte or block of bytes is programmed. In either case a complete verify of the programmed array will ensure reliable programming of the 87C51FX.

The lock bits cannot be directly verified. Verification of the lock bits is done by observing that their features are enabled.

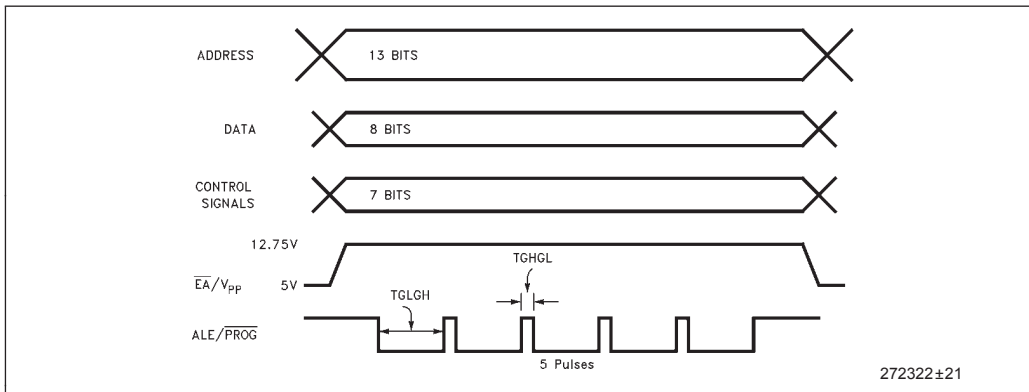

Figure 11. Programming Signals Waveforms

ROM and EPROM Lock System

The 87C51FX program lock system, when programmed, protects the onboard program against software piracy.

lock-bit and encryption array are programmed by the factory. The encryption array is not available without the lock bit. For the lock bit to be programmed, the user must submit an encryption table. The 83C51FA does not have protection features.

The 83C51FX has a one-level program lock system and a 64-byte encryption table. See line 2 of Table 5. If program protection is desired, the user submits the encryption table with their code, and both the

The 87C51FX has a 3-level program lock system and a 64-byte encryption array. Since this is an EPROM device, all locations are user-programmable. See Table 5.

Table 5. Program Lock Bits and the Features

Program Lock Bits				Protection Type
	LB1	LB2	LB3	
1	U	U	U	No Program Lock features enabled. (Code verify will still be encrypted by the Encryption Array if programmed.)
2	P	U	U	MOVC instructions executed from external program memory are disabled from fetching code bytes from internal memory, EA is sampled and latched on Reset, and further programming of the EPROM is disabled.
3	P	P	U	Same as 2, also verify is disabled.
4	P	P	P	Same as 3, also external execution is disabled.

Any other combination of the lock bits is not defined.

Encryption Array

Within the EPROM array are 64 bytes of Encryption Array that are initially unprogrammed (all 1's). Every time that a byte is addressed during a verify, 6 address lines are used to select a byte of the Encryption Array. This byte is then exclusive-NOR'ed (XNOR) with the code byte, creating an Encryption Verify byte. The algorithm, with the array in the unprogrammed state (all 1's), will return the code in its original, unmodified form. For programming the Encryption Array, refer to Table 4 (Programming the EPROM).

When using the encryption array, one important factor needs to be considered. If a code byte has the value 0FFH, verifying the byte will produce the encryption byte value. If a large block (> 64 bytes) of code is left unprogrammed, a verification routine will display the contents of the encryption array. For this reason all unused code bytes should be programmed with some value other than 0FFH, and not all of them the same value. This will ensure maximum program protection.

Program Lock Bits

The 87C51FX has 3 programmable lock bits that when programmed according to Table 5 will provide different levels of protection for the on-chip code and data.

Erasing the EPROM also erases the encryption array and the program lock bits, returning the part to full functionality.

Reading the Signature Bytes

The 87C51FX has 3 signature bytes in locations 30H, 31H, and 60H. The 83C51FA has 2 signature

bytes in locations 30H and 31H. To read these bytes follow the procedure for EPROM verify, but activate the control lines provided in Table 4 for Read Signature Byte.

Location	Device	Contents
30H	All	89H
31H	All	58H
60H	83C51FA	7AH/FAH
	87C51FA	FAH
	83C51FB	7BH/FBH
	87C51FB	FBH
	83C51FC	7CH/FCH
	87C51FC	FCH

Erase Characteristics (Windowed Packages Only)

Erase of the EPROM begins to occur when the chip is exposed to light with wavelength shorter than approximately 4,000 Angstroms. Since sunlight and fluorescent lighting have wavelengths in this range, exposure to these light sources over an extended time (about 1 week in sunlight, or 3 years in room-level fluorescent lighting) could cause inadvertent erasure. If an application subjects the device to this type of exposure, it is suggested that an opaque label be placed over the window.

The recommended erasure procedure is exposure to ultraviolet light (at 2537 Angstroms) to an integrated dose of at least 15 W-sec/cm. Exposing the EPROM to an ultraviolet lamp of 12,000 μ W/cm rating for 30 minutes, at a distance of about 1 inch, should be sufficient.

Erasure leaves all the EPROM Cells in a 1's state.

EPROM PROGRAMMING AND VERIFICATION CHARACTERISTICS

DATA SHEET REVISION HISTORY

Data sheets are changed as new device information becomes available. Verify with your local Intel sales office that you have the latest version before finalizing a design or ordering devices.

The following differences exist between this datasheet (272322-005) and the previous version (272322-004):

1. Product prefix variables are now indicated with an x.

The following differences exist between this datasheet (272322-003) and the previous version (272322-002):

1. Removed 8XC51FX-3 and 8XC51FX-20, replaced with 8XC51FX-24.
2. Included 8XC51FX-24 and 8XC51FX-33 devices.
3. 80C51FA and 83C51FA now have the same features as 87C51FA, 8XC51FB and 8XC51FC; same DC spec used for all devices.

The following differences exist between the ``-002" and ``-001" version of 8XC51FX datasheet:

1. Removed 8XC51FX-L from datasheet.
2. Include V_{OH1} for 83C51FA (Express)/80C51FA (Express).

This 8XC51FX datasheet (272322-001) replaces the following datasheets:
