

1-cell Li-ion Battery Protection IC with High-accuracy Overcurrent Detection, Reset signal

NO.EA-393-190123

OUTLINE

The R5611L is a one-cell Li-ion / polymer battery protection IC provides an overcurrent detection with using an external resistor. An external FET can be switched ON / OFF by the reset signal of RST. The discharge overcurrent can be detected with high-accuracy of $\pm 3.0\text{mV}$ ($-20^\circ\text{C} \leq T_a \leq 60^\circ\text{C}$).

FEATURES

- Absolute Maximum Rating..... 12 V
- Supply Current at Normal Mode Typ.3.0 μA / Max.6 μA ($T_a=25^\circ\text{C}$)
- Standby Current..... Max.0.5 μA ($T_a=25^\circ\text{C}$)

Reset Function

- Reset detection / release voltage Typ.1.2V ($\pm 0.3\text{V}$, $T_a=25^\circ\text{C}$)
- Reset detection delay time 50ms
- Reset release delay time..... 32ms / 48ms

Detector Selectable Range and Accuracy (Unless otherwise provided, $-20^\circ\text{C} \leq T_a \leq 60^\circ\text{C}^{(1)}$)

- Overcharge detection voltage 4.430V to 4.495V (in 5mV step, $\pm 20\text{mV}$)
- Overcharge release voltage..... 4.03V to 4.495V
(in 5mV step, $\pm 55\text{mV}$, Hysteresis $\leq 0.4\text{V}$)
- Overdischarge detection voltage..... 2.1V to 3.0V (in 50mV step, $\pm 55\text{mV}$)
- Overdischarge release voltage 2.3V to 3.1V (in 50mV step, $+105\text{mV}/-65\text{mV}$)
- Discharge overcurrent detection voltage 1 0.015V to 0.025V (in 1mV step, $\pm 3\text{mV}$)
- Discharge overcurrent detection voltage 2 0.024V to 0.045V (in 1mV step, $\pm 5\text{mV}$)
- Charge overcurrent detection voltage -0.017V to -0.024V (in 1mV step, $\pm 3\text{mV}$)
- Short-circuit detection voltage 0.055V to 0.200V (in 10mV step, $\pm 20\text{mV}$)

Output delay time

- Overcharge detection delay time 1.0s
- Overcharge release delay time..... 1.2ms
- Overdischarge detection delay time 64ms
- Overdischarge release delay time 1.2ms
- Selectable discharge overcurrent detection delay time 1 4096ms
- Selectable discharge overcurrent detection delay time 2 16ms
- Short-circuit detection delay time 280 μs
- Discharge overcurrent release delay time 8.5ms
- Charge overcurrent detection delay time 17ms
- Charge overcurrent release delay time..... 4ms

⁽¹⁾ The specifications are guaranteed by design engineering at $-20^\circ\text{C} \leq T_a \leq 60^\circ\text{C}$.

Functions

- Selectable 0V-battery charge Permission
- Selectable overcharge detection Auto-release
- Selectable overdischarge detection Auto-release
- Discharge overcurrent Auto-release

Package

- Small Package DFN1616-8

APPLICATIONS

- Li+ / Li Polymer protector of overcharge, overdischarge, overcurrent for battery pack
- High precision protectors for cell-phones and any other gadgets using on board Li+ / Li Polymer battery

SELECTION GUIDE

Set voltages, Delay times are, and Optional functions are user-selectable.

Selection Guide

| Product Name | Package | Quantity per Reel | Pb Free | Halogen Free |
|-----------------|-----------|-------------------|---------|--------------|
| R5611Lxxx\$*-TR | DFN1616-8 | 5,000 pcs | Yes | Yes |

xxx: Specify the combination of the following set output voltages. Refer to *Product Code List* for details.

Overcharge detection voltage (V_{DET1}): 4.430 V to 4.495 V in 5 mV step

Overcharge release voltage (V_{REL1}): 4.030 V to 4.495 V in 5 mV step

Overdischarge detection voltage (V_{DET2}): 2.1 V to 3.0 V in 50 mV step

Overdischarge release voltage (V_{REL2}): 2.3 V to 3.1 V in 50 mV step

Discharge overcurrent detection voltage 1 (V_{DET31}): 0.015 V to 0.025 V in 1 mV step

Discharge overcurrent detection voltage 2 (V_{DET32}): 0.024 V to 0.045 V in 1 mV step

Short-circuit detection voltage (V_{SHORT}): 0.055 V to 0.200 V in 10 mV step

Charge overcurrent detection voltage (V_{DET4}): -0.017 V to -0.024 V in 1mV step

\$: Specify the combination of overcharge detection / release delay time (t_{VDET1}/t_{VREL1}), overdischarge detection / release delay time (t_{VDET2}/t_{VREL2}), discharge overcurrent delay time1/2 (t_{VDET31}/t_{VDET32}), discharge overcurrent release delay time (t_{VREL3}), charge overcurrent detection / release delay time (t_{VDET4}/t_{VREL4}). Refer to *Delay Time Code Table* for details.

*: Specify the combination of functions. Refer to *Function Code Table* for details.

Delay Time Code Table / Function Code Table

| Code | t_{RREL} | Unit | Reset Released |
|------|------------|------|---------------------|
| BC | 48 | ms | RST only |
| DE | 32 | ms | RST or V_{SHORT2} |

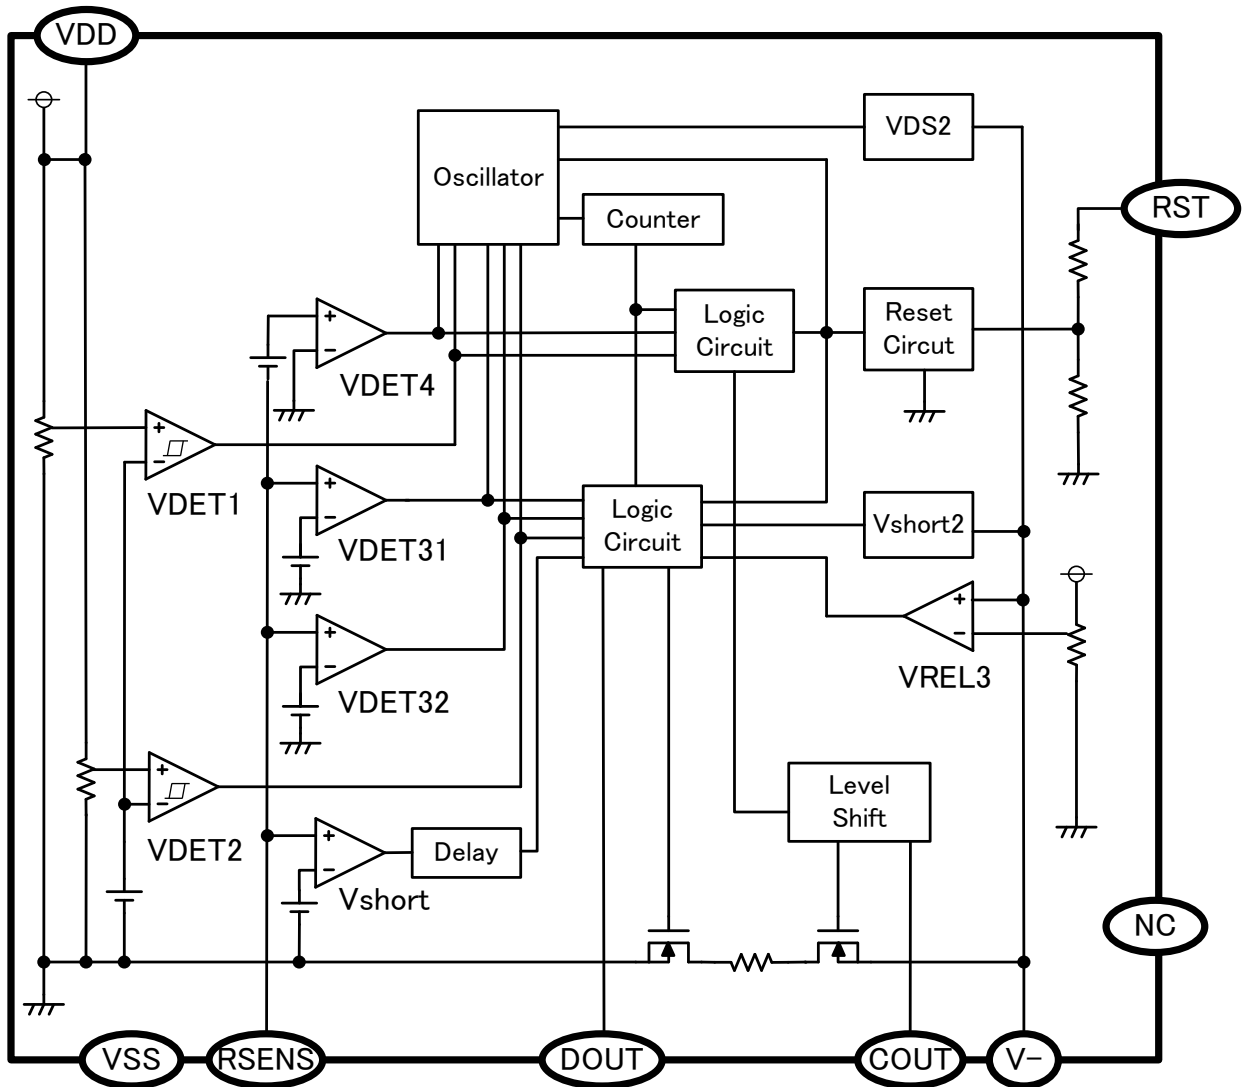

Product Code List

The product code is determined by a combination of the three digits set output voltage code, the delay time code, and the function code.

Product Code Table

| Product Name | Set Output Voltage (V) | | | | | | | | Delay Time |
|--------------|------------------------|------------|------------|------------|-------------|-------------|-------------|------------|------------|
| | V_{DET1} | V_{REL1} | V_{DET2} | V_{REL2} | V_{DET31} | V_{DET32} | V_{SHORT} | V_{DET4} | t_{RREL} |
| R5611L201BC | 4.445 | 4.295 | 2.350 | 2.550 | 0.0210 | 0.030 | 0.080 | -0.021 | 48 |
| R5611L201DE | 4.445 | 4.295 | 2.350 | 2.550 | 0.0210 | 0.030 | 0.080 | -0.021 | 32 |
| R5611L205DE | 4.475 | 4.325 | 2.350 | 2.550 | 0.0210 | 0.030 | 0.080 | -0.021 | 32 |
| R5611L205BC | 4.475 | 4.325 | 2.350 | 2.550 | 0.0210 | 0.030 | 0.080 | -0.021 | 48 |

BLOCK DIAGRAMS

R5611L Block Diagram

PIN DESCRIPTIONS

| Pin No | Symbol | Pin Description |
|--------|--------|---|
| 1 | RST | Forced OFF input pin for COUT and DOUT pins |
| 2 | V- | Charger negative input pin |
| 3 | COUT | Overcharge detection output pin, CMOS output |
| 4 | DOUT | Overdischarge detection output pin, CMOS output |
| 5 | VSS | Ground pin for the IC |
| 6 | VDD | Power supply pin, the substrate level of the IC |
| 7 | RSENS | Overcurrent detection input pin |
| 8 | NC | No connection |

ABSOLUTE MAXIMUM RATINGS

(Ta = 25°C, V_{SS} = 0V)

| Symbol | Item | Rating | Unit |
|--------------------|----------------------------------|--|------|
| V _{DD} | Supply voltage | -0.3 to 12 | V |
| V- | V- pin input voltage | V _{DD} -30 to V _{DD} +0.3 | V |
| V _{RSENS} | RSENS pin input voltage | V _{SS} -0.3 to V _{DD} +0.3 | V |
| V _{RST} | RST pin input voltage | V _{SS} -0.3 to V _{DD} +0.3 | V |
| V _{COUT} | COUT pin output voltage | V _{DD} -30 to V _{DD} +0.3 | V |
| V _{DOUT} | DOUT pin output voltage | V _{SS} -0.3 to V _{DD} +0.3 | V |
| P _D | Power Dissipation ⁽¹⁾ | 150 | mW |
| T _j | Junction Temperature Range | -40 to 125 | °C |
| T _{stg} | Storage Temperature Range | -55 to 125 | °C |

ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause permanent damage and may degrade the lifetime and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITION

| Symbol | Item | Rating | Unit |
|-----------------|-----------------------------|------------|------|
| V _{DD} | Operating Input Voltage | 1.5 to 5.0 | V |
| T _a | Operating Temperature Range | -40 to 85 | °C |

RECOMMENDED OPERATING CONDITIONS

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

⁽¹⁾ Refer to *POWER DISSIPATION* in *SUPPLEMENTARY ITEMS* for detail information.

L

M

OPERATION

Overcharge Detection, VD1

The VD1 monitors a VDD pin voltage during charge. When the VDD voltage crosses overcharge detection voltage (V_{DET1})⁽¹⁾, the VD1 can sense overcharge and the output of COUT pin becomes “L” and stop charging by turning off the external Nch. MOSFET. After detecting overcharge, when the VDD pin voltage is equal or less than the released voltage from overcharge (V_{REL1})⁽¹⁾, or when the VDD pin voltage is less than the overcharge detection voltage (V_{DET1})⁽¹⁾, if the charger is removed, VD1 is released, then the output level of COUT becomes “H” and by turning on the external Nch. MOSFET, the battery charger is ready to work again. However, depending on the characteristics of external components such as MOSFETs, release conditions may be not enough and a kind of load must be set to release the overcharge. When the Input level of VDD pin is equal or more than overcharge detector threshold, and while a charger is disconnected from the battery pack, if a load system is connected to the battery pack, the output level of COUT pin is “L”. However, load current can be drawn through a parasitic diode of an external Nch. MOSFET. Then, when the voltage level of VDD pin becomes lower than overcharge detector threshold, the output level of COUT pin becomes “H”.

Output delay time for overcharge detect and released overcharge is internally fixed respectively. Although the VDD pin voltage goes up to a higher level than overcharge detector threshold within the output delay time (t_{VDET1})⁽¹⁾, VD1 would not work for detecting overcharge. If the action for VD1 to release is done and the condition returns to the initial one within the output delay time (t_{VREL1})⁽¹⁾, VD1 cannot be released.

A level shifter is built in a buffer driver for the COUT pin, therefore, the “L” level is equal to the voltage level of V- pin. The output type of COUT pin is CMOS type and its output level is in between VDD and V-.

Overdischarge Detection, VD2 or VDET2

The VD2 monitors a VDD pin voltage during discharge. When the VDD pin voltage crosses the overdischarge detector threshold (V_{DET2})⁽¹⁾ from a high level to a lower level than V_{DET2} , the VD2 senses overdischarge and stop discharge by turning off an external Nch. MOSFET.

To reset the VD2 with the DOUT pin level being “H” again after detecting overdischarge, if VDD pin voltage is equal or less than overcharge detector threshold, a charge current flows through a parasitic diode of the external Nch. MOSFET. After that, when VDD voltage is more than overdischarge threshold, DOUT pin becomes “H”, and by tuning on the external Nch. MOSFET, discharge is possible. In the case that a charger is connected to the battery pack, and VDD level is more than overdischarge detection voltage, the output level of DOUT pin becomes “H” immediately. Without connecting a charger, if VDD pin voltage is equal or more than the released voltage from overdischarge (V_{REL2})⁽¹⁾, the output level of DOUT becomes “H”.

When a cell voltage is equal to 0V, connecting a charger to the battery pack makes COUT pin become “H” and the system is allowable for charge while the voltage of the charger is more than the maximum limit of the minimum operating voltage (V_{ST})⁽¹⁾ for 0V charge.

An output delay for overdischarge detection (t_{VDET2})⁽¹⁾ is fixed internally. Although the voltage of VDD pin becomes equal or less than overdischarge detector threshold and if it becomes higher than overdischarge detector threshold within output delay time, overdischarge detector does not work. Output delay time for release from overdischarge (t_{VREL2})⁽¹⁾ is also set internally. After detecting overdischarge by VD2, supply current would decrease, ($V_{DD}=2.0V$, Max. $0.5\mu A$.) because unnecessary circuits are halted and being standby.

The output type of DOUT pin is CMOS type and its output level is in between VDD and VSS.

⁽¹⁾ Indicates the value shown in the table of “[5] Electrical Characteristics”.

Discharge overcurrent detection / Short-circuit protection, VD31 and VD32

While charge and discharge are acceptable with the battery pack, current flows through an external sense resistance and the generated drop voltage by the current is detected as RSENS pin voltage, VD3 monitors the voltage level of RSENS pin. In the case of such as the external short circuit, if the voltage level of RSENS pin may become equal or more than the discharge overcurrent detection voltage (V_{DET3})⁽¹⁾ and less than the short detector threshold (V_{SHORT})⁽¹⁾, the discharge overcurrent detection works. When the voltage level of RSENS pin becomes equal or more than the short detector threshold voltage, the short circuit protector works and the output level of DOUT becomes “L”, and by turning off an external Nch. MOSFET, VD3 protects against flowing extremely large current into the circuit.

An output delay time for the discharge overcurrent detection is internally fixed. Even if the voltage of RSENS pin becomes equal or more than the discharge overcurrent detection voltage and less than the short detection voltage (V_{SHORT})⁽¹⁾, if the RSENS pin voltage becomes less than the overcurrent detection voltage within the output delay time (t_{VDET3})⁽¹⁾, the overcurrent detection does not work. Even if RSENS pin becomes equal or more than the short circuit detection voltage, if RSENS pin becomes lower than the short detection voltage within the short detection delay time (t_{SHORT})⁽¹⁾, the short detection does not work. Output delay time for release from discharge overcurrent, short circuit is also set internally (t_{VREL3})⁽¹⁾.

The V- pin has a built-in pull down resistor connected to the V_{SS} pin.

After a discharge overcurrent or short circuit protection is detected, by removing a cause of overcurrent or external short circuit, the voltage level of V- is pulled down through the resistor for release from overcurrent to the V_{SS} level. While charge and discharge are acceptable for the battery pack, or normal mode, the resistor is inactive.

Then, when the voltage level of V- pin becomes equal or less than the released voltage from discharge overcurrent (V_{REL3})⁽¹⁾, both protection circuits are released automatically. Resistor for release from discharge overcurrent is active when discharge overcurrent or short circuit is detected.

V- pin voltage is represented by the equation below when V- pin is pulled down by discharge overcurrent or short detecting.

$$V_- = \frac{R_{short}}{R_L + R_2 + R_{short}} V_{DD}$$

V_{DD} : Input Voltage (Cell Voltage)⁽²⁾

R_{SHORT} : Internal resistance of V- pin when it is pulled down⁽¹⁾

R₂ : External resistor between Pack minus and V- pin⁽²⁾

R_L : Resistance of load between Pack plus and Pack minus⁽²⁾

Output delay time for discharge overcurrent is necessarily set shorter than output delay time for overdischarge. Therefore, if discharge overcurrent is detected, and at the same time, V_{DD} pin voltage becomes lower than overdischarge detection voltage, discharge overcurrent detection is predominant. By disconnecting load from the battery pack, the battery pack is automatically released from overcurrent state.

⁽¹⁾ Indicates the value shown in the table of “[5] Electrical Characteristics”.

⁽²⁾ Indicates the value shown in the table of “[8] Technical Notes”.

Charge overcurrent detection, VD4

While charge and discharge are acceptable with the battery pack, VD4 senses RSENS pin voltage. For example, if the battery pack is charged by an inappropriate charger, overcurrent flows through an external resistance and the generated voltage drop is monitored as RSENS pin voltage, and the RSENS pin voltage becomes equal or less than the charge overcurrent detection voltage (V_{DET4})⁽¹⁾, then, the output of C_{OUT} becomes "L", and VD4 protects against flowing excess current in the circuit by turning off the external Nch MOSFET. Output delay of the excess charge current is internally fixed. (t_{VDET4})⁽¹⁾ Even the voltage level of RSENS pin becomes equal or lower than the charge overcurrent detection voltage, if the voltage is higher than the VD4 threshold within the delay time, the charge overcurrent state is not detected. Output delay time for release from charge overcurrent is also set internally (t_{VREL4})⁽¹⁾.

VD4 can be released by disconnecting the abnormal charger.

Delay time in short-circuit mode

When the C_{OUT} pin is "H", the output delay time of overcharge, and overdischarge can be shorter than those setting values by forcing equal or lower than the delay shortening mode detection voltage (V_{DS2} Typ. -2.0V) and more than -3.0V to V- pin.

RESET function

When the R5611 receives a reset signal as RST to input "H", not only the output of D_{OUT} pin but the output of C_{OUT} switches to "L" level after the internal fixed delay time. After detecting reset signal, the R5611 can be reset and the output of D_{OUT} and C_{OUT} becomes "H" after RST is made open or V- voltage. RST terminal is connected to V- internal resistance. After detecting reset signal, V_{DET_x} (x=1,2,31,32,4) and V_{SHORT} can't work. On the other hands, after detecting V_{DET_x} or V_{SHORT} , Reset can't work.

⁽¹⁾ Indicates the value shown in the table of "[5] Electrical Characteristics".

APPLICATION INFORMATION

Typical Application Circuit

R5611LxxxXX Typical Application Circuit

External Components

| Symbol | Min. | Typ. | Max. |
|-----------------|--------|-------|-------|
| Resistor | | | |
| $R_{VDD}^{(1)}$ | | 330Ω | 1kΩ |
| $R_{V-}^{(1)}$ | - | 1kΩ | 1.3kΩ |
| R_{SENS} | - | 5mΩ | 20mΩ |
| R_{RST} | - | 1kΩ | 10kΩ |
| Capacitor | | | |
| C_{VDD} | 0.01μF | 0.1μF | 1μF |
| C_{RST} | - | 0.1μF | - |

(1) The total resistance of R_{VDD} and R_{V-} must be 1kΩ or more.

Technical Notes on the Selection Components

- The voltage fluctuation is stabilized with R_{VDD} and C_{VDD} . If a R_{VDD} is too large, by the conduction current at detection, the detection voltage rises. Therefore, it is recommended to use a resistor of $1\text{k}\Omega$ or less for R_{VDD} and a capacitor of $0.01\ \mu\text{F}$ to $1.0\ \mu\text{F}$ for C_{VDD} in order to stabilize the operation.
- R_{VDD} and R_{V-} serve as a current limit resistor when the battery pack is charged with reversed polarity or a voltage of the connected charger is more than the absolute maximum rating. When using a small resistor for R_{VDD} and R_{V-} , the device's power dissipation might be exceeded. Therefore, a total of R_{VDD} and R_{V-} must be $1\text{k}\Omega$ or more. When using a large resistor for R_{V-} , the charger might not be released by re-connecting to the battery pack after the overdischarge detection. Therefore, R_{V-} must be $1.3\ \text{k}\Omega$ or less. Production variation and temperature properties are included in the value. R_{SENS} is a resistor for sensing an excess current. If the resistance value is too large, power loss becomes also large. By the excess current, if the R_{SENS} is not appropriate, the power loss may be beyond the power dissipation of R_{SENS} . Choose an appropriate R_{SENS} according to the cell specification. R_{RST} and C_{RST} are used to control noise. R_{RST} must be less than $10\text{k}\Omega$.
- The typical application circuit diagrams are just examples. This circuit performance largely depends on the PCB layout and external components. In the actual application, fully evaluation is necessary.
- If the positive terminal and the negative terminal of the battery pack are short even though the device has the short protection circuit, a large current may flow through the FET during the delay time until detecting the short circuit. Therefore, select an appropriate FET with large enough current capacitance in order to endure the large current during the delay time.

Selection of External FET

Short mode is detected by the current base or the relation between V_{DD} at short and total on resistance of external MOSFETs for COUT and DOUT.

If short must be detected by the current base determined by V_{SHORT1} , V_{SHORT2} , and $R3$, the next formula must be true, otherwise, the short current limit becomes $(V_{SHORT2}) / (R3 + R_{SS} (on))$

$$\frac{V_{short2}}{R3 + R_{SS}(on)} \geq \frac{V_{short1}}{R3}$$

V_{SHORT1} = Threshold value of detecting short circuit using R_{SENS} terminal (V)

V_{SHORT2} = Threshold value of detecting short circuit using V- terminal (V)

$R3$ = External current sense Resistance (Ω)

$R_{SS} (on)$ = external MOSFETs' total ON Resistance (Ω)

Notes: in case of the short mode is specified at short current determined by the relation between $R3$ and V_{SHORT} value,

Ex.

As the R_{SENS} , in case that the $3m\Omega$ is selected as $R3$ and if the V_{DD}^* becomes $3.3V$, to detect short at $26.7A$ with $V_{SHORT1} = 0.080V$ and $V_{SHORT2} = V_{DD} - 1.45$, the $R_{SS} (on)$ must be $66m\Omega$ or lower.

Otherwise, according to the $R_{SS} (on)$, short current limit is lower than expected.

DFN-1616-8 Package Dimensions (Unit: mm)

* The tab on the bottom of the package shown by blue circle is a substrate potential (GND). It is recommended that this tab be connected to the ground plane on the board but it is possible to leave the tab floating.

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact Ricoh sales or our distributor before attempting to use AOI.
11. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.

Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.
