# CMAXIAV 1.4MHz SOT23 Current-Mode Step-Up DC-DC Converter 

## General Description

The MAX1896 step-up DC-DC converter incorporates high-performance current-mode, fixed-frequency, pulse-width modulation (PWM) circuitry and an internal $0.7 \Omega \mathrm{~N}$-channel MOSFET to provide a highly efficient regulator with fast response.
High switching frequency ( 1.4 MHz ) allows fast loop response and easy filtering with small components. The MAX1896 can produce an output voltage as high as 13 V from an input as low as 2.6 V . Soft-start is programmable with an external capacitor, which sets the input current ramp rate. In shutdown mode, current consumption is reduced to $0.01 \mu \mathrm{~A}$.
The MAX1896 is available in a space-saving 6-pin SOT23 package. The ultra-small package and high switching frequency allow cost and space-efficient implementations.

Applications
Notebook Computers
LCD Displays
PCMCIA Cards
Portable Applications
Hand-Held Devices

Typical Operating Circuit

- >90\% Efficiency
- Adjustable Output Up to 13V
- Guaranteed 12V/120mA Output from 5V Input
- 2.6V to 5.5V Input Range
- LT1613 Pin Compatible
- $0.01 \mu \mathrm{~A}$ Shutdown Current
- Programmable Soft-Start
- Space-Saving 6-Pin SOT23 Package

Features

### 1.4MHz SOT23 Current-Mode Step-Up DC-DC Converter

ABSOLUTE MAXIMUM RATINGS
LX to GND
-0.3 V to +14 V
.- 0.3 V to +6 V
IN, SHDN, FB to GND $\qquad$
-0.3 V to (VIN +0.3 V )
SS to GND
RMS LX Pin Current .................................................
6-Pin SOT23 (derate $9.1 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ above $+70^{\circ} \mathrm{C}$ )........... 727 mW

Operating Temperature Range
$-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

Note 1: Thermal properties are specified with product mounted on PC board with one square-inch of copper area and still air.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

| 5 | SS | Soft-Start Input. Connect a soft-start capacitor from SS to GND to soft-start the converter. Leave SS <br> open to disable the soft-start function. See the Soft-Start section. |
| 6 | IN | Internal Bias Voltage Input. Connect IN to the input voltage source. Bypass IN to GND with a <br> $1 \mu$ F or greater capacitor as close to IN as possible. |

# 1.4MHz SOT23 Current-Mode Step-Up DC-DC Converter 

__Detailed Description
The MAX1896 is a highly efficient power supply that employs a current-mode, fixed-frequency pulse-width modulation (PWM) architecture for fast-transient response and low-noise operation. The functional diagram is shown in Figure 2. As the load varies, the error amplifier sets the inductor peak current necessary to supply the load and regulate the output voltage. To maintain stability at high duty cycle, a slope-compensation signal is internally summed with the current-sense signal.
At light loads, this architecture allows the MAX1896 to skip cycles to prevent overcharging the output voltage. In this region of operation, the inductor ramps up to a peak value of about 100 mA , discharges to the output and waits until another pulse is needed again.

## Output-Current Capability

The output-current capability of the MAX1896 is a function of current limit, input voltage, and inductor value. Because of the slope compensation used to stabilize the feedback loop, the duty cycle affects the current limit. The output-current capability is governed by the following equation:

$$
\begin{aligned}
& \operatorname{lOUT}(\mathrm{MAX})= \\
& {\left[(\text { LIIM } \times(1.45-0.9 \times \text { Duty }))-\left(\frac{0.5 \times \text { Duty } \times \mathrm{V}_{I N}}{\mathrm{f}_{\mathrm{OSC}} \times \mathrm{L}}\right)\right]} \\
& \times \eta \times \frac{\mathrm{V}_{I N}}{\mathrm{~V}_{\mathrm{OUT}}}
\end{aligned}
$$

where:
ILIM $=$ current limit specified at 50\% (see Electrical Characteristics)

$$
\begin{aligned}
& \text { DUTY }=\text { DUTY } C Y C L E= \\
& \frac{V_{O U T}-V_{I N}+V_{\text {DIODE }}}{V_{\text {OUT }}-I_{\text {LIM }} \times R_{O N}+V_{\text {DIODE }}}
\end{aligned}
$$

VDIODE $=$ catch diode forward drop at ILIM, (V)
foSC = oscillator frequency, $(\mathrm{Hz})$
$L$ = inductor value, (H)
$\eta=$ conversion efficiency, 0.85 nominal
VIN = input voltage, (V)
VOUT = output voltage, (V)

## Soft-Start

The MAX1896 can be programmed for soft-start upon power-up with an external capacitor. When the MAX1896 is turned on, the soft-start capacitor (CSS) is charged at a constant current of $4 \mu \mathrm{~A}$, ramping up to 0.5 V . During this time, the SS voltage directly controls the peak-inductor current, allowing 0 A at $\mathrm{V}_{S S}=0.5 \mathrm{~V}$ to the full current limit at $\mathrm{V} S S=1.5 \mathrm{~V}$. The maximum load current is available after the soft-start cycle is completed. When the MAX1896 is turned off, the soft-start capacitor is internally discharged to ground.

## Shutdown

The MAX1896 shuts down to reduce the supply current to $0.01 \mu \mathrm{~A}$ when $\overline{\text { SHDN }}$ is low. In this mode, the internal reference, error amplifier, comparators, biasing circuit, and N-channel MOSFET are turned off. The step-up converter's output is still connected to IN via the external inductor and output rectifier.

## Applications Information

The MAX1896 operates well with a variety of external components. The components in Figure 1 are suitable for most applications. See the following sections to optimize external components for a particular application.

## Inductor Selection

Inductor selection depends on input voltage, output voltage, maximum current, size, and availability of inductor values. Other factors can include efficiency and ripple voltage. Inductors are specified by their inductance (L), peak current (IPK), and resistance ( $R_{L}$ ). The following step-up circuit equations are useful in choosing the inductor values based on the application. They allow the trading of peak current and inductor value while considering component availability and cost.
The equation used here assumes a constant LIR, which is the ratio of the inductor peak-to-peak AC current to average DC inductor current. A good compromise between the size of the inductor versus loss and output ripple is to choose an LIR of 0.3 to 0.5 . The peak inductor current is then given by:

$$
\mathrm{IPK}=\left(\frac{\mathrm{IOUT}(\mathrm{MAX}) \times \mathrm{V}_{\mathrm{OUT}}}{\eta \times \mathrm{V}_{\mathrm{IN}(\mathrm{MIN})}}\right) \times\left(1+\frac{\mathrm{LIR}}{2}\right)
$$

where:
IOUT(MAX) = maximum output current, (A)
$\operatorname{VIN}(\mathrm{MIN})=$ minimum input voltage, $(\mathrm{V})$

# 1.4MHz SOT23 Current-Mode Step-Up DC-DC Converter 

The inductance $(\mathrm{H})$ value is then given by:

$$
L=\frac{\left.\left[V_{\text {IN(MIN })}\right)^{\times} \times \eta \times\left(V_{\text {OUT }}-V_{\text {IN(MIN })}\right)\right]}{V_{\text {OUT }}{ }^{2} \times \operatorname{LIR} \times \operatorname{lOUT}(\mathrm{MAX}) \times \mathrm{f}_{\text {OSC }}}
$$

## Diode Selection

The output diode should be rated to handle the output voltage and the peak switch current. Make sure the diode's peak current rating is at least IPK and that its breakdown voltage exceeds VOUT. Schottky diodes are recommended. If a junction rectifier is used, it must be an ultra-fast type (trr < 50ns) to prevent excessive loss in the rectifier.

## Input and Output Capacitor Selection

The MAX1896 operates with both tantalum and ceramic output capacitors. When using tantalum capacitors, the zero caused by the ESR of the tantalum is used to ensure stability. When using ceramic capacitors, the zero due to the ESR will be at too high a frequency to be useful in stabilizing the control loop. When using ceramic capacitors, use a feedforward capacitor to increase the phase margin, improving the control-loop stability. Figure 3 shows the circuit with ceramic capacitors and the feedforward capacitor, CFF. Use the following equation to determine the value of the feedforward capacitor:

$$
C_{F F}=\frac{k 1}{R 1} \times\left[\frac{C_{\text {OUT }} \times V_{\text {OUT }}{ }^{2}}{V_{I N}}\right]^{0.5}
$$

where:

$$
\mathrm{k} 1=7.14 \times 10^{-4} \text { with units of }\left(\frac{\Omega \times \mathrm{F}}{\mathrm{~A}}\right)^{0.5}
$$

R1 = see Figure 3, ( $\Omega$ )
COUT = total output capacitance including any bypass capacitor on the output bus, (Farads). See Figure 3.
VOUT = output voltage, (V)
VIN = input voltage, ( V ).

Setting the Output Voltage
The MAX1896 operates with an adjustable output from $\mathrm{V}_{\mathrm{IN}}$ to 13 V . Connect a resistive voltage-divider from the output to FB (see Typical Operating Circuit). Choose a value for R2 between $10 \mathrm{k} \Omega$ and $50 \mathrm{k} \Omega$. Calculate R1 using the equation:

$$
\mathrm{R} 1=\mathrm{R} 2 \times\left(\frac{\mathrm{V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{FB}}}-1\right)
$$

where $V_{F B}$, the step-up regulator feedback set point, is 1.24 V . Connect the resistive-divider as close to the IC as possible.

## Soft-Start Capacitor

The soft-start capacitor should be large enough that the current limit does not reach final value before the output has reached regulation. Calculate CSS to be:

$$
\begin{aligned}
& C_{S S}>k_{2} \times C_{\text {OUT }} \times \\
& {\left[\frac{V_{\text {OUT }}{ }^{2}-V_{\text {IN }} \times V_{\text {OUT }}}{V_{\text {IN }} \times I_{\text {INRUSH }}-I_{\text {OUT }} \times V_{\text {OUT }}}\right]}
\end{aligned}
$$

where:
$\mathrm{k}_{2}=21 \times 10^{-6},(\mathrm{~S})$
VOUT = maximum output voltage, ( V )
IINRUSH = peak inrush current allowed, (A)
IOUT = maximum output current during power-up stage, (A)
VIN = minimum input voltage, (V)
The soft-start duration (tss) is the time it takes the current limit to reach its final value. The soft-start duration can be calculated by the equation:

$$
\mathrm{t}_{\mathrm{ss}}=\mathrm{k} 3 \times \mathrm{Css}
$$

where:

$$
\mathrm{k}_{3}=6.67 \times 10^{5} \Omega
$$

# 1.4MHz SOT23 Current-Mode Step-Up DC-DC Converter 

## Application Circuits

## Layout Procedure

Good PC board layout and routing are required in highfrequency switching power supplies to achieve good regulation, and stability. It is strongly recommended that the evaluation kit PC board layouts be followed as closely as possible. Refer to the MAX1896 EV kit for a good layout. Place power components as close together as possible, keeping their traces short, direct, and wide. Avoid interconnecting the ground pins of the power components using vias through an internal ground plane. Instead, keep the power components close together and route them in a star ground configuration using component side copper, then connect the star ground to internal ground using multiple vias.
