DS90LV019
3.3V or 5V LVDS Driver/Receiver

General Description

The DS90LV019 is a Driver/Receiver designed specifically for the high speed low power point-to-point interconnect applications. The device operates from a single 3.3V or 5.0V power supply and includes one differential line driver and one receiver. The DS90LV019 features an independent driver and receiver with TTL/CMOS compatibility (D_{IN} and R_{OUT}). The logic interface provides maximum flexibility as 4 separate lines are provided (D_{IN}, DE, $\overline{RE}$, and R_{OUT}). The device also features a flow-through pin out which allows easy PCB routing for short stubs between its pins and the connector. The driver has 3.5 mA output loop current.

The driver translates between TTL levels (single-ended) to Low Voltage Differential Signaling levels. This allows for high speed operation, while consuming minimal power with reduced EMI. In addition, the differential signaling provides common-mode noise rejection.

The receiver threshold is ±100 mV over a ±1V common-mode range and translates the low swing differential levels to standard (TTL/CMOS) levels.

Features

- LVDS Signaling
- 3.3V or 5.0V operation
- Low power CMOS design
- Balanced Output Impedance
- Glitch free power up/down (Driver disabled)
- High Signaling Rate Capacity (above 100 Mbps)
- Ultra Low Power Dissipation
- ±1V Common-Mode Range
- ±100 mV Receiver Sensitivity
- Product offered in SOIC and TSSOP packages
- Flow-Through Pin Out
- Industrial Temperature Range Operation

Note 1: "Absolute Maximum Ratings" are these beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

Note 2: All currents into device pins are positive; all currents out of device pins are negative. All voltages are referenced to device ground unless otherwise specified.

Note 3: All typicals are given for V_{CC} = +3.3V or +5.0V and T_A = +25˚C, unless otherwise stated.

Note 4: ESD Rating:

HBM (1.5 kΩ, 100 pF) > 2.0 kV

EIAJ (0Ω, 200 pF) > 200V.

Note 5: C_L includes probe and fixture capacitance.

Note 6: Generator waveforms for all tests unless otherwise specified; f = 1 MHz, Z_O = 50Ω, t_r = t_f ≤ 6.0 ns (0%–100%).

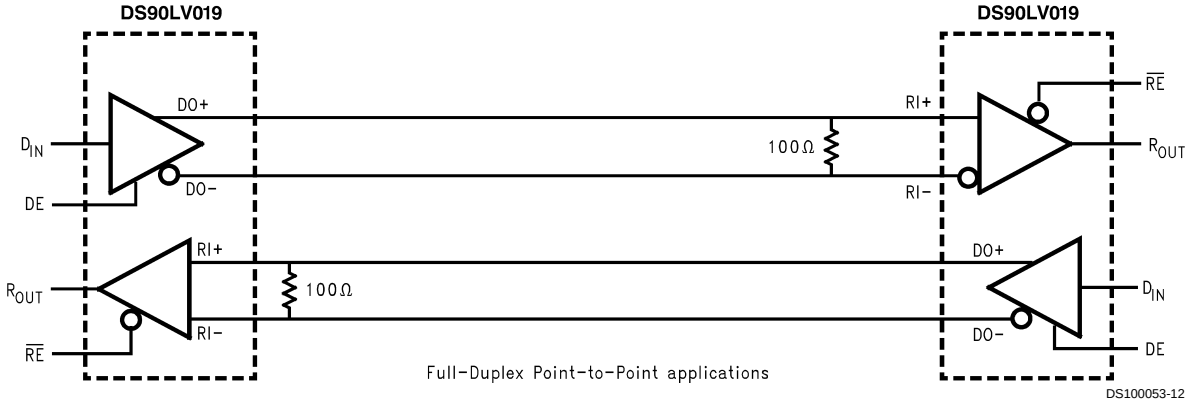
Typical Application Diagram



Applications Information

The DS90LV019 has two control pins, which allows the device to operate as a driver, a receiver or both driver and a receiver at the same time. There are a few common practices which should be implied when designing PCB for LVDS signaling. Recommended practices are:

- Use at least 4 PCB board layer (LVDS signals, ground, power and TTL signals).
- Keep drivers and receivers as close to the (LVDS port side) connector as possible.
- Bypass each LVDS device and also use distributed bulk capacitance. Surface mount capacitors placed close to power and ground pins work best. Two or three multilayer ceramic (MLC) surface mount capacitors 0.1 µF, and 0.01 µF in parallel should be used between each V_{CC} and ground. The capacitors should be as close as possible to the V_{CC} pin.
- Use controlled impedance traces which match the differential impedance of your transmission medium (i.e., Cable) and termination resistor.
- Use the termination resistor which best matches the differential impedance of your transmission line.
- Isolate TTL signals from LVDS signals.

MEDIA (CABLE AND CONNECTOR) SELECTION:

- Use controlled impedance media. The cables and connectors should have a matched differential impedance of about 100Ω.

Applications Information (Continued)

- Balanced cables (e.g., twisted pair) are usually better than unbalanced cables (ribbon cable, simple coax) for noise reduction and signal quality.
- For cable distances < 0.5m, most cables can be made to work effectively. For distances 0.5m ≤ d ≤ 10m, CAT 3 (category 3) twisted pair cable works well and is readily available and relatively inexpensive. For distances > 10m, and high data rates CAT 5 twisted pair is recommended.
- There are three Fail-Safe scenarios, open input pins, shorted inputs pins and terminated input pins. The first case is guaranteed for DS90LV019. A HIGH state on R_{OUT} pin can be achieved by using two external resistors (one to V_{CC} and one to GND) per *Figure 10* (Terminated Input Fail-Safe Circuit). R1 and R2 should be R_T to limit the loading to the LVDS driver . R_T is selected to match the impedance of the cable.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

General Description

The DS90LV019 is a Driver/Receiver designed specifically for the high speed low power point-to-point interconnect applications. The device operates from a single 3.3V or 5.0V power supply and includes one differential line driver and one receiver. The DS90LV019 features an independent driver and receiver with TTL/CMOS compatibility (D_{IN} and R_{OUT}). The logic interface provides maximum flexibility as 4 separate lines are provided (D_{IN}, DE, RE#, and R_{OUT}). The device also features a flow-through pin out which allows easy PCB routing for short stubs between its pins and the connector. The driver has 3.5 mA output loop current.

The driver translates between TTL levels (single-ended) to Low Voltage Differential Signaling levels. This allows for high speed operation, while consuming minimal power with reduced EMI. In addition, the differential signaling provides common-mode noise rejection.

The receiver threshold is ±100 mV over a ±1V common-mode range and translates the low swing differential levels to standard (TTL/CMOS) levels.

Features

- LVDS Signaling
- 3.3V or 5.0V operation
- Low power CMOS design
- Balanced Output Impedance
- Glitch free power up/down (Driver disabled)
- High Signaling Rate Capacity (above 100 Mbps)
- Ultra Low Power Dissipation
- ±1V Common-Mode Range
- ±100 mV Receiver Sensitivity
- Product offered in SOIC and TSSOP packages
- Flow-Through Pin Out
- Industrial Temperature Range Operation

[Information as of 5-Aug-2002]
