

100310

Low Skew 2:8 Differential Clock Driver

General Description

The 100310 is a low skew 8-bit differential clock driver which is designed to select between two separate differential clock inputs. The low output to output skew (< 50 ps) is maintained for either clock input. A LOW on the select pin (SEL) selects CLKINA, CLKINA and a HIGH on the SEL pin selects the CLKINB, CLKINB inputs.

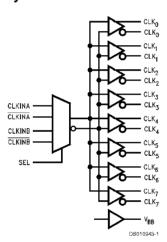

The 100310 is ideal for those applications that need the ability to freely select between two clocks, or to maintain the ability to switch to an alternate or backup clock should a problem arise with the primary clock source.

A $V_{\mbox{\footnotesize BB}}$ output is provided for single-ended operation.

Features

- Low output to output skew
- Differential inputs and outputs
- Allows multiplexing between two clock inputs
- Voltage compensated operating range: -4.2V to -5.7V

Note 4: tpg describes opposite edge skews, i.e. the difference between the delay of a differential output signal pair's low to high and high to low propagation delays. With differential signal pairs, a low to high or high to low transition is defined as the transition of the true output or input pin.

Note 5: to_SLH describes in-phase gate-to-gate differential propagation skews with all differential outputs going low to high; to_SHL describes the same conditions except with the outputs going high to low.

Note 6: t_{OST} describes the maximum worst case difference in any of the t_{PS} , t_{OSLH} or t_{OST} delay paths combined.

Note 7: The skew specifications pertain to differential I/O paths.
