MAXIM

Quad Differential LVECL-to-LVPECL Translators

General Description

The MAX9420–MAX9423 are extremely fast, low-skew quad LVECL-to-LVPECL translators designed for high-speed signal and clock driver applications. The devices feature ultra-low propagation delay of 336ps and channel-to-channel skew of 17ps.

The four channels can be operated synchronously with an external clock, or in asynchronous mode, determined by the state of the SEL input. An enable input provides the ability to force all the outputs to a differential low state.

These devices operate with a negative supply voltage of -2.0V to -3.6V, compatible with LVECL input signals. The positive supply range is 2.375V to 3.6V for differential LVPECL output signals.

A variety of input and output terminations are offered for maximum design flexibility. The MAX9420 has open inputs and open-emitter outputs. The MAX9421 has open inputs and 50Ω series outputs. The MAX9422 has 100Ω differential input impedance and open-emitter outputs. The MAX9423 has 100Ω differential input impedance and 50Ω series outputs.

The MAX9420–MAX9423 are specified for operation from -40°C to +85°C, and are offered in space-saving 32-pin 5mm × 5mm TQFP and 32-lead 5mm × 5mm QFN packages.

Applications

Data and Clock Driver and Buffer

Central Office Backplane Clock Distribution

DSLAM Backplane

Base Station

ATE

Functional Diagram appears at end of data sheet.

Features

- **>500mV Differential Output at 3.0GHz Clock**
- **336ps (typ) Propagation Delay in Asynchronous Mode**
- **17ps (typ) Channel-to-Channel Skew**
- **Integrated 50Ω Outputs (MAX9421/MAX9423)**
- **Integrated 100Ω Inputs (MAX9422/MAX9423)**
- **Synchronous/Asynchronous Operation**

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	DATA INPUT	OUTPUT
MAX9420EHJ	-40°C to +85°C	32 TQFP	Open	Open

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pin Description

PIN	NAME	FUNCTION
1, 8	V_{EE}	Negative Supply Voltage. Bypass V_{EE} to GND with 0.1µF and 0.01µF ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device.
2	SEL	Noninverting Differential Select Input. Setting SEL = high and $\overline{SEL}$ = low (differential high) enables all four channels to operate asynchronously. Setting SEL = low and $\overline{SEL}$ = high (differential low) enables all four channels to operate in synchronous mode.
3	$\overline{SEL}$	Inverting Differential Select Input
4	$\overline{CLK}$	Inverting Differential Clock Input. A rising edge on CLK (and falling on $\overline{CLK}$) transfers data from the inputs to the outputs when SEL = differential low.
5	CLK	Noninverting Differential Clock Input
6	EN	Noninverting Differential Output Enable Input. Setting EN = high and $\overline{EN}$ = low (differential high) enables the outputs. Setting EN = low and $\overline{EN}$ = high (differential low) drives the output low.
7	$\overline{EN}$	Inverting Differential Output Enable Input
9	IN3	Noninverting Differential Input 3
10	$\overline{IN3}$	Inverting Differential Input 3
11, 17, 24, 30	V_{CC}	Positive Supply Voltage. Bypass V_{CC} to GND with 0.1µF and 0.01µF ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device.
12	$\overline{OUT3}$	Inverting Differential Output 3
13	OUT3	Noninverting Differential Output 3
14, 20, 21, 27	GND	Ground
15	IN2	Noninverting Differential Input 2
16	$\overline{IN2}$	Inverting Differential Input 2
18	$\overline{OUT2}$	Inverting Differential Output 2
19	OUT2	Noninverting Differential Output 2
22	OUT1	Noninverting Differential Output 1
23	$\overline{OUT1}$	Inverting Differential Output 1
25	$\overline{IN1}$	Inverting Differential Input 1
26	IN1	Noninverting Differential Input 1
28	OUT0	Noninverting Differential Output 0
29	$\overline{OUT0}$	Inverting Differential Output 0
31	$\overline{IN0}$	Inverting Differential Input 0
32	IN0	Noninverting Differential Input 0
—	EP	Exposed Paddle (MAX942_EGJ only). Connected to V_{EE} internally. See package dimensions.

Quad Differential LVECL-to-LVPECL Translators

Detailed Description

The MAX9420–MAX9423 are extremely fast, low-skew quad LVECL-to-LVPECL translators designed for high-speed signal and clock driver applications. The devices feature ultra-low propagation delay of 336ps and channel-to-channel skew of 17ps.

The four channels can be operated synchronously with an external clock, or in asynchronous mode, determined by the state of the SEL input. An enable input provides the ability to force all the outputs to a differential low state.

These devices operate with a negative supply voltage of -2.0V to -3.6V, compatible with LVECL input signals. The positive supply range is 2.375V to 3.6V for differential LVPECL output signals.

A variety of input and output terminations are offered for maximum design flexibility. The MAX9420 has open inputs and open-emitter outputs. The MAX9421 has open inputs and 50Ω series outputs. The MAX9422 has 100Ω differential input impedance and open-emitter outputs. The MAX9423 has 100Ω differential input impedance and 50Ω series outputs.

Supply Voltages

For interfacing to differential LVECL input levels, the V_{EE} range is -2.0V to -3.6V with GND = 0. The V_{CC} range is from 2.375V to 3.6V, compatible with LVPECL logic. Output levels are referenced to V_{CC}.

Data Inputs

The MAX9420/MAX9421 have open inputs and require external termination. The MAX9422/MAX9423 have integrated 100Ω differential input termination resistors from IN_ to $\overline{IN\_}$, reducing external component count.

Outputs

The MAX9421/MAX9423 have internal 50Ω series output termination resistors and 8mA internal pulldown current sources. Using integrated resistors reduces external component count.

The MAX9420/MAX9422 have open-emitter outputs. An external termination is required. See the *Output Termination* section.

Enable

Setting EN = high and $\overline{EN}$ = low enables the device. Setting EN = low and $\overline{EN}$ = high forces the outputs to a differential low. All changes on CLK, SEL, and IN_ are ignored.

Asynchronous Operation

Setting SEL = high and $\overline{SEL}$ = low enables the four channels to operate independently as LVECL-to-LVPECL translators. The CLK signal is ignored in this mode. In asynchronous mode, the CLK signal should be set to either logic low or high state to minimize noise coupling.

Synchronous Operation

Setting SEL = low and $\overline{SEL}$ = high enables all four channels to operate in synchronized mode. In this mode, buffered inputs are clocked into flip-flops simultaneously on the rising edge of the differential clock input (CLK and $\overline{CLK}$).

Differential Signal Input Limit

The maximum signal magnitude of all the differential inputs is 3.0V.

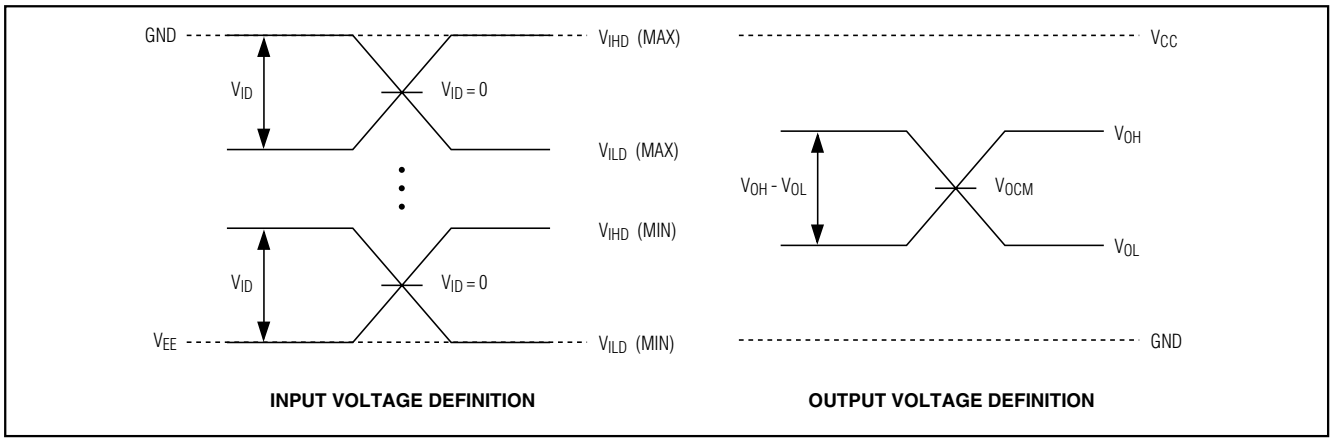

Figure 1. Input and Output Voltage Definitions

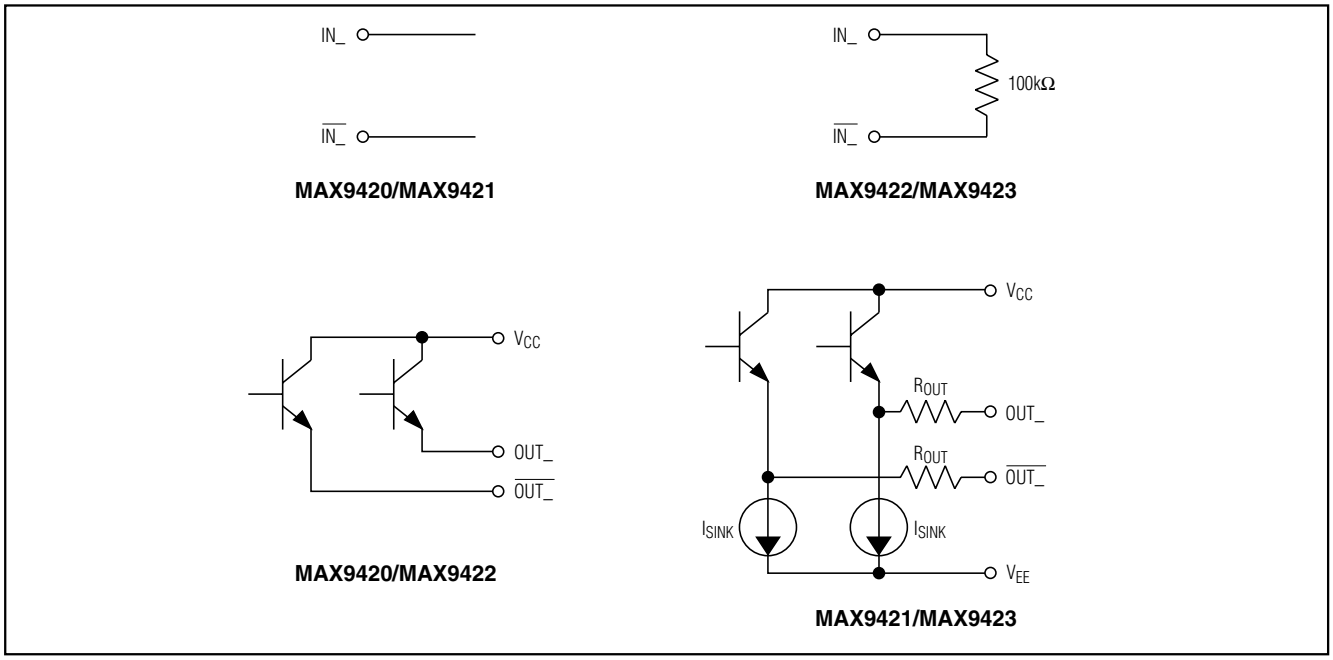

Figure 2. Input and Output Configurations

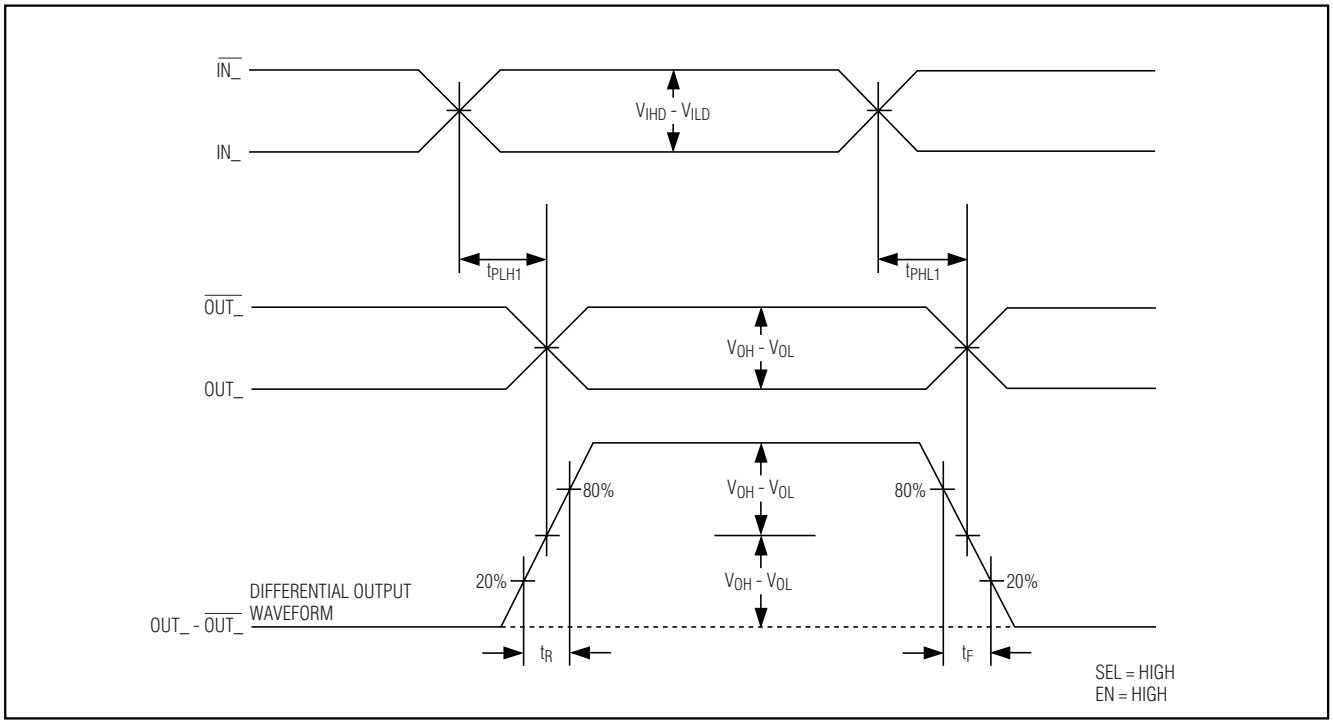

Figure 3. IN-to-OUT Propagation Delay Timing Diagram

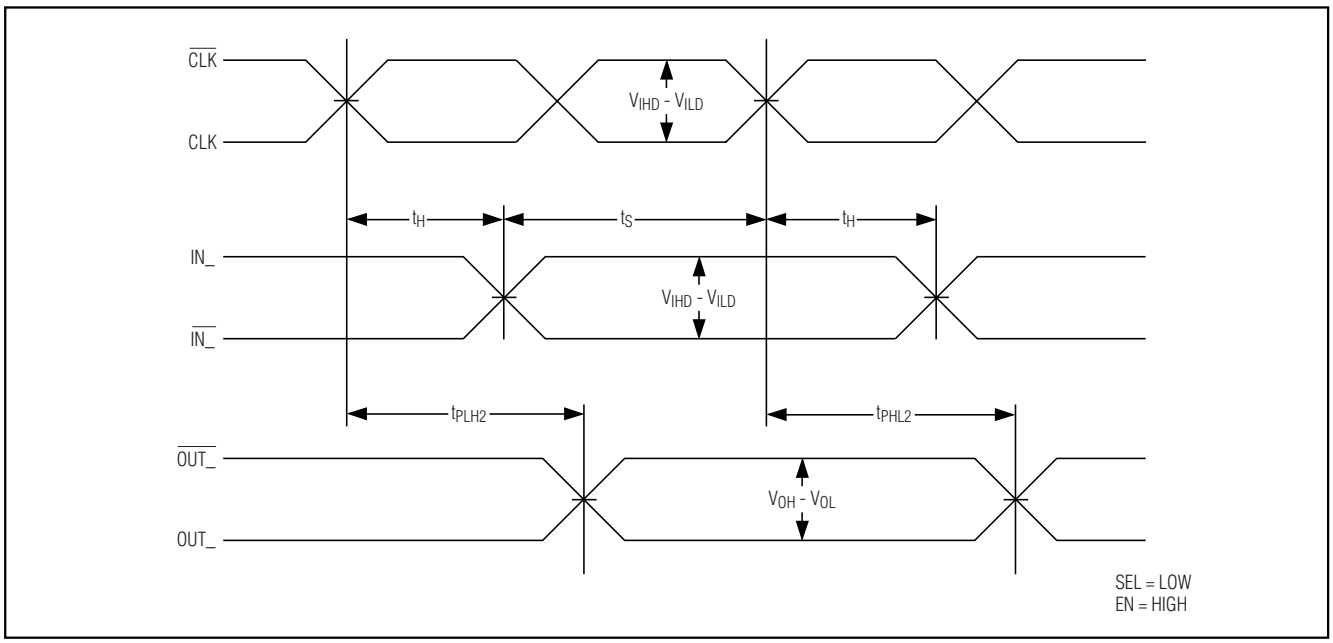

Figure 4. CLK-to-OUT Propagation Delay Timing Diagram

Applications Information

Input Bias

Unused inputs should be biased or driven as shown in Figure 5. This avoids noise coupling that might cause toggling at the unused outputs.

Output Termination

Terminate open-emitter outputs (MAX9420/MAX9422) through 50Ω to V_{CC} - 2V or use an equivalent Thevenin termination. Terminate outputs using identical termination on each for the lowest output-to-output skew. When a single-ended signal is taken from a differential output, terminate both outputs. For example, if OUT_ is used as a single-ended output, terminate both OUT_ and $\overline{OUT\_}$.

Ensure that the output currents do not exceed the current limits as specified in the *Absolute Maximum Ratings* table. Under all operating conditions, the device's total thermal limits should be observed.

Power-Supply Bypassing

Adequate power-supply bypassing is necessary to maximize the performance and noise immunity. Bypass V_{CC} to GND and V_{EE} to GND with high-frequency surface-mount ceramic 0.1µF and 0.01µF capacitors in parallel as close to the device as possible, with the 0.01µF capacitor closest to the device pins. Use multiple parallel vias for ground-plane connection to minimize inductance.

Circuit Board Traces

Input and output trace characteristics affect the performance of the MAX9420–MAX9423. Connect each of the inputs and outputs to a 50Ω characteristic impedance trace. Avoid discontinuities in differential impedance and maximize common-mode noise immunity by maintaining the distance between differential traces and avoid sharp corners. Minimize the number of vias to prevent impedance discontinuities. Reduce the reflections by maintaining 50Ω characteristic impedance through connectors and across cables. Minimize skew by matching the electrical length of the traces.
