DS64MB201

Dual Lane 2:1/1:2 Mux/Buffer with Equalization and De-Emphasis

General Description

The DS64MB201 is a dual lane 2:1 multiplexer and 1:2 switch or fan-out buffer with signal conditioning suitable for SATA/SAS and other high-speed bus applications up to 6.4 Gbps. The device performs both receive equalization and transmit de-emphasis, allowing maximum flexibility of physical placement within a system. The receiver's continuous time linear equalizer (CTLE) provides a boost of up to +33 dB at 3 GHz and is capable of opening an input eye that is completely closed due to inter-symbol interference (ISI) induced by the interconnect medium. The transmitter features a programmable output de-emphasis driver and allows amplitude voltage levels to be selected from 600 mVp-p to 1200 mVp-p to suit multiple application scenarios. The signal conditioning settings are programmable via control pin settings or SMBus interface.

To enable seamless upgrade from SAS/SATA 3.0 Gbps to 6.0 Gbps data rates without compromising physical reach, DS64MB201 automatically detects the incoming data rate and selects the optimal de-emphasis pulse width. The device detects the out-of-band (OOB) idle and active signals of the SAS/SATA specification and passes through with minimum signal distortion.

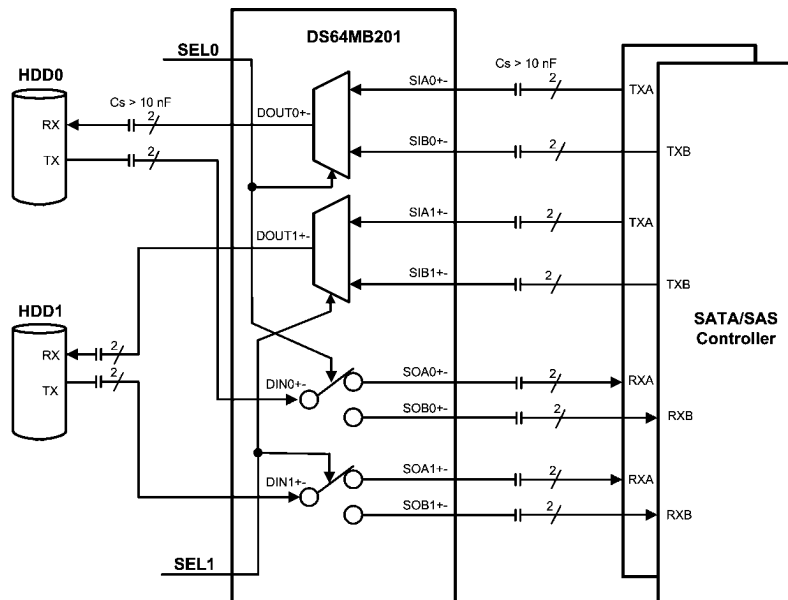

Features

- Up to 6.4 Gbps dual lane 2:1 mux, 1:2 switch or fan-out
- Adjustable receive equalization up to +33 dB gain
- Adjustable transmit de-emphasis up to -12 dB
- Adjustable transmit VOD
- <0.25 UI of residual DJ at 6.4 Gbps with 40" FR4 trace
- SATA/SAS: OOB signal pass-through
- Adjustable electrical IDLE detect threshold
- Low power
- Signal conditioning programmable via pin selection or SMBus interface
- Single 2.5V supply operation
- >6 kV HBM ESD Rating
- 3.3V tolerant SMBus interface
- High speed signal flow-thru pinout package: 54-pin LLP (10 mm x 5.5 mm)

Applications

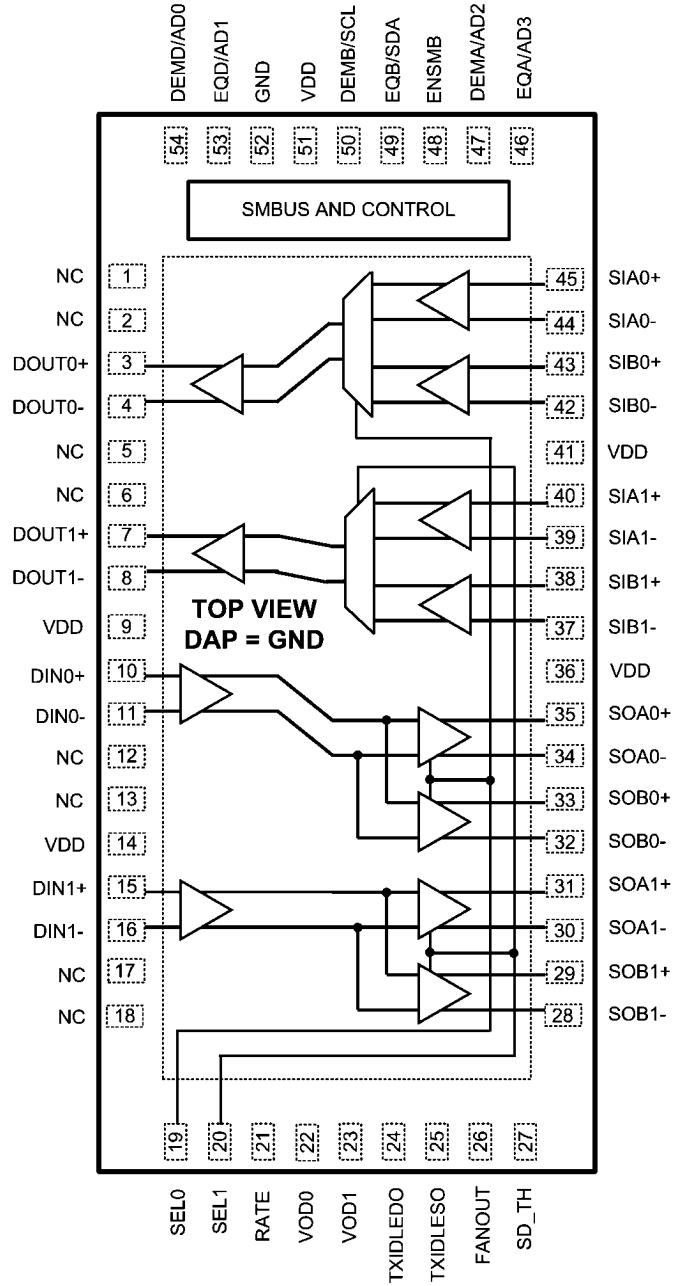

- SATA (1.5, 3.0 and 6 Gbps)
- SAS (1.5, 3.0 and 6 Gbps)
- XAUI (3.125 Gbps), RXAUI (6.25 Gbps)
- sRIO – Serial Rapid I/O
- Fibre Channel (4.25 Gbps)
- 10GBase-CX4, InfiniBand (SDR & DDR)
- FR-4 backplane traces

Typical Application

30076480

Pin Descriptions

Pin Name	Pin Number	I/O, Type	Pin Description
Differential High Speed I/O's			
SIA0+, SIA0-, SIA1+, SIA1-	45, 44, 40, 39	I, CML	Inverting and non-inverting CML differential inputs to the equalizer. A gated on-chip 50Ω termination resistor connects SIA_n+ to VDD and SIA_n- to VDD when enabled.
SOA0+, SOA0-, SOA1+, SOA1-	35, 34, 31, 30	O	Inverting and non-inverting low power differential signaling 50Ω outputs with de-emphasis. Fully compatible with AC coupled CML inputs.
SIB0+, SIB0-, SIB1+, SIB1-	43, 42, 38, 37	I, CML	Inverting and non-inverting CML differential inputs to the equalizer. A gated on-chip 50Ω termination resistor connects SIB_n+ to VDD and SIB_n- to VDD when enabled.
SOB0+, SOB0-, SOB1+, SOB1-	33, 32, 29, 28	O	Inverting and non-inverting low power differential signaling 50Ω outputs with de-emphasis. Fully compatible with AC coupled CML inputs.
DIN0+, DIN0-, DIN1+, DIN1-	10, 11, 15, 16	I, CML	Inverting and non-inverting CML differential inputs to the equalizer. A gated on-chip 50Ω termination resistor connects SIB_n+ to VDD and SIB_n- to VDD when enabled.
DOU0+, DOU0-, DOU1+, DOU1-	3, 4, 7, 8	O	Inverting and non-inverting low power differential signaling 50Ω outputs with de-emphasis. Fully compatible with AC coupled CML inputs.
Control Pins — Shared (LVCMOS)			
ENSMB	48	I, LVCMOS w/ internal pull- down	System Management Bus (SMBus) enable pin. HIGH = Register Access: Provides access to internal digital registers to control such functions as equalization, de-emphasis, VOD, rate, channel powerdown, and idle detection threshold. LOW = Pin Mode: Access to the SMBus registers are disabled and control pins are used to program VOD, rate, idle detection, equalization and de-emphasis settings. Please refer to “SMBus configuration Registers” section and Electrical Characteristics - Serial Management Bus Interface for detailed information.
ENSMB = 1 (SMBUS MODE)			
SDA, SCL	49, 50	I, LVCMOS	ENSMB = 1 The SMBus SDA (data input/output bi-directional) and SCL (clock input) pins are enabled.
AD[3:0]	54, 53, 47, 46	I, LVCMOS w/ internal pull- down	ENSMB = 1 SMBus Slave Address Inputs. In SMBus mode, these pins are the user set SMBus slave address inputs.
ENSMB = 0 (NORMAL PIN MODE)			
EQA, EQB, EQD	46, 49, 53	I, Float, LVCMOS	EQA/B/D, 3-level input controls the level of equalization. EQA controls the level of equalization of the SIA0 and SIA1 inputs. EQB controls the level of equalization of the SIB0 and SIB1 inputs. EQD controls the level of equalization of the DIN0 and DIN1 inputs. The pins are active only when ENSMB is de-asserted (Low). When ENSMB goes high the SMBus control registers provide independent control of each lane. See Table 1
DEMA, DEMB, DEMD	47, 50, 54	I, Float, LVCMOS	DEMA/B/D, 3-level input controls the level of de-emphasis. DEMA controls the level of de-emphasis of the SOA0 and SOA1 outputs. DEMB controls the level of de-emphasis of the SOB0 and SOB1 outputs. DEMD controls the level of de-emphasis of the DOU0 and DOU1 outputs. The pins are active only when ENSMB is de-asserted (Low). When ENSMB goes High the SMBus control registers provide independent control of each lane. See Table 2

Pin Name	Pin Number	I/O, Type	Pin Description
Control Pins — Both Modes (LVCMOS)			
RATE	21	I, Float, LVCMOS	RATE, 3-level input controls the pulse width of de-emphasis of the output. RATE = 0 forces ~3 Gbps, RATE = 1 forces ~6 Gbps, RATE = Float enables auto rate detection. See Table 2
TXIDLEDO	24	I, Float, LVCMOS	TXIDLEDO, 3-level input controls the driver output. TXIDLEDO = 0 disables the signal detect/squelch function for DOUT. TXIDLEDO = 1 forces the DOUT to be muted (electrical idle). TXIDLEDO = Float enables the signal auto detect/squelch function for DOUT and the signal detect voltage threshold level can be adjusted using the SD_TH pin. See Table 3
TXIDLESO	25	I, Float, LVCMOS	TXIDLESO, 3-level input controls the driver output. TXIDLESO = 0 disables the signal detect/squelch function for SOUT. TXIDLESO = 1 forces the SOUT to be muted (electrical idle). TXIDLESO = Float enables the signal auto detect/squelch function for SOUT and the signal detect voltage threshold level can be adjusted using the SD_TH pin. See Table 3
FANOUT	26	I, LVCMOS w/ internal pull-down	FANOUT = 1 enables both A/B outputs for broadcast mode. FANOUT = 0 disables one of the outputs depending on the SEL0, SEL1 pin. See Table 5
SEL0, SEL1	19, 20	I, LVCMOS w/ internal pull-down	SEL0 is for lane 0, SEL1 is for lane 1 SEL0, SEL1 = 0 selects B input and B output. SEL0, SEL1 = 1 selects A input and A output. See Table 5
VOD0, VOD1	22, 23	I, LVCMOS w/ internal pull-down	VOD[1:0] adjusts the output differential amplitude voltage level on all outputs. 00 set output VOD = 600 mVp-p (Default) 01 sets output VOD = 800 mVp-p 10 sets output VOD = 1000 mVp-p 11 sets output VOD = 1200 mVp-p Note: VOD should be set to a minimum of 1000 mV to achieve stated DE levels.
Analog			
SD_TH	27	I, ANALOG	Threshold select pin for electrical idle detect threshold. Float pin for default 130 mVp-p (differential). See Table 4
Power			
VDD	9, 14, 36, 41, 51	Power	2.5V Power supply pins.
GND	DAP, 52	Power	DAP is the large metal contact at the bottom side, located at the center of the 54 pin LLP package. It should be connected to the GND plane with at least 4 via to lower the ground impedance and improve the thermal performance of the package. NOTE: DAP is the primary GND
NC	1, 2, 5, 6, 12, 13, 17, 18		No Connect — Leave pin open

1 = HIGH, 0 = LOW, FLOAT = 3rd input state.

FLOAT condition; Do not drive pin; pin is internally biased to mid level with 50 kΩ pull-up/pull-down.

Internal pulled-down = Internal 30 kΩ pull-down resistor to GND is present on the input.

Input edge rate for LVCMOS/FLOAT inputs must be faster than 50 ns from 10–90%.

Absolute Maximum Ratings *(Note 1)*

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage (VDD)	-0.5V to +3.0V
LVC MOS Input/Output Voltage	-0.5V to +4.0V

Note 1: "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. Absolute Maximum Numbers are guaranteed for a junction temperature range of -40°C to +125°C. Models are validated to Maximum Operating Voltages only.

Note 2: Typical values represent most likely parametric norms at V_{DD} = 2.5V, T_A = 25°C., and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.

Note 3: The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 4: OOB signal pass-through limited to a minimum ambient temperature of -10C

Note 5: Allowed supply noise (mV_{p-p} sine wave) under typical conditions.

Note 6: Measured with clock-like {11111 00000} pattern.

Note 7: Measured with ENSMB = 1, all channels disabled using SMBus registers 0x01 and 0x02, and EQ in bypass (Default)

Note 8: Measured at package pins of receiver. Less than 65 mV_{p-p} is IDLE, greater than 175 mV_{p-p} is ACTIVE. SD_TH pin connected with resistor to GND overrides this default setting.

Note 9: Common-mode voltage (VCM) is expressed mathematically as the average of the two signal voltages with respect to local ground.

VCM = (A + B) / 2, A = OUT+, B = OUT-.

Functional Description

The DS64MB201 is a 2-lane signal conditioning 2:1 multiplexer and 1:2 switch or fan-out buffer optimized for PCB FR4 trace and cable interconnects up to 6 Gbps data rate. The DS64MB201 operates in two modes: Pin Control Mode (ENSMB = 0) and SMBus Mode (ENSMB = 1).

Pin Control Mode:

When in pin mode (ENSMB = 0), the transceiver is configurable with external pins. Equalization and de-emphasis can be selected via pin for each side independently. When de-emphasis is asserted VOD is automatically increased per the De-Emphasis table below for improved performance over lossy media. Rate optimization is also pin controllable, with

pin selections for 3 Gbps, 6 Gbps, and auto detect. The receiver electrical idle detect threshold is also programmable via an optional external resistor on the SD_TH pin.

SMBUS Mode:

When in SMBus mode the VOD amplitude level, equalization and de-emphasis are all programmable on a individual lane basis, instead of grouped by sides as in the pin mode case. Upon assertion of ENSMB pins EQx and DEMx functions revert to register control immediately. The EQx and DEMx pins are converted to AD0-AD3 SMBus address pins. The other external control pins remain active unless their respective registers are written to, in which case they are ignored until ENSMB is driven low. On power-up and when ENSMB is driven low all registers are reset to their default state.

TABLE 1. Equalization Input Select Pins for SIA, SIB and DIN (3-Level Input)

EQA, EQB, EQD	Equalization Level
0	9 dB at 3 GHz
Float (No Connect)	13.5 dB at 3 GHz
1	18.4 dB at 3 GHz

Note: F = Float (No Connect), 1 = High and 0 = Low.

TABLE 2. De-Emphasis Input Select Pins for SOA, SOB and DOUT (3-Level Input)

RATE	DEMA, DEMB, DEMD	De-Emphasis Level (typ)	DE Pulse Width (typ)	VOD (typ)
0/F	0	-3.5 dB	330 ps	VOD = 1000 mVp-p
		-2 dB	330 ps	VOD = 1200 mVp-p
0/F	1	-6 dB	330 ps	VOD = 1000 mVp-p
		-3 dB	330 ps	VOD = 1200 mVp-p
1/F	0	-3.5 dB	200 ps	VOD = 1000 mVp-p
		-2 dB	200 ps	VOD = 1200 mVp-p
1/F	1	-6 dB	200 ps	VOD = 1000 mVp-p
		-3 dB	200 ps	VOD = 1200 mVp-p
0/F	F	-9 dB	250 ps enhanced	VOD = 1200 mVp-p
1/F	F	-12 dB	160 ps enhanced	VOD = 1200 mVp-p

Note: F = Float (No Connect), 1 = High and 0 = Low. Enhanced DE pulse width provides de-emphasis on second bit.

When RATE = F (auto rate detection active), the DE level and pulse width settings follow detected rate. RATE = 0 is 3 Gbps and RATE = 1 is 6 Gbps. De-emphasis should only be used with VOD = 1000 mVp-p or 1200 mVp-p. VOD less than 1000 mVp-p is not recommended with de-emphasis. Please refer to VOD1 and VOD0 pin description to set the output differential voltage level.

TABLE 3. Idle Control (3-Level Input)

TXIDLEDO/SO	Function
0	This state is for lossy media, dedicated Idle threshold detect circuit disabled, output follows input based on EQ settings. Idle state not guaranteed.
Float	Float enables automatic idle detection. Idle on the input is passed to the output. Internal 50K Ω resistors hold TXIDLEDO/SO pin at a mid level - don't connect this pin if the automatic idle detect function is desired. This is the default state. Output in Idle if differential input signal less than value set by SD_TH pin.
1	Manual override, output in electrical Idle. Differential inputs are ignored.

TABLE 4. Receiver Electrical Idle Detect Threshold Adjust

SD_TH resistor value (Ω)	Receiver Electrical Idle Detect Threshold (DIFF p-p)
Float (no resistor required)	130 mV (default condition)
0	225 mV
80k	20 mV

SD_TH resistor value can be set from 0 through 80k ohms to achieve desired idle detect threshold, see [Figure 5](#)

30076493

FIGURE 5. Typical Idle Threshold vs. SD_TH resistor value

Device Connection Paths

The lanes of the DS64MB201 can be configured either as a 2:1 multiplexer, 1:2 switch or fan-out buffer. The controller side is muxed to the disk drive side. The below table shows the logic for the multiplexer and switch functions.

TABLE 5. Logic Table of Switch and Mux Control

FANOUT	SEL0	SEL1	Function — connection path
0	0	0	DOUT0 connects to SIB0. DOUT1 connects to SIB1. DIN0 connects to SOB0. SOA0 is in idle (output muted). DIN1 connects to SOB1. SOA1 is in idle (output muted).
0	0	1	DOUT0 connects to SIB0. DOUT1 connects to SIA1. DIN0 connects to SOB0. SOA0 is in idle (output muted). DIN1 connects to SOA1. SOB1 is in idle (output muted).
0	1	0	DOUT0 connects to SIA0. DOUT1 connects to SIB1. DIN0 connects to SOA0. SOB0 is in idle (output muted). DIN1 connects to SOB1. SOA1 is in idle (output muted).
0	1	1	DOUT0 connects to SIA0. DOUT1 connects to SIA1. DIN0 connects to SOA0. SOB0 is in idle (output muted). DIN1 connects to SOA1. SOB1 is in idle (output muted).
1	0	0	DOUT0 connects to SIB0. DOUT1 connects to SIB1. DIN0 connects to SOB0 and SOA0. DIN1 connects to SOB1 and SOA1.
1	0	1	DOUT0 connects to SIB0. DOUT1 connects to SIA1. DIN0 connects to SOB0 and SOA0. DIN1 connects to SOA1 and SOB1.
1	1	0	DOUT0 connects to SIA0. DOUT1 connects to SIB1. DIN0 connects to SOA0 and SOB0. DIN1 connects to SOB1 and SOA1.
1	1	1	DOUT0 connects to SIA0. DOUT1 connects to SIA1. DIN0 connects to SOA0 and SOB0. DIN1 connects to SOA1 and SOB1.

System Management Bus (SMBus) and Configuration Registers

The System Management Bus interface is compatible to SMBus 2.0 physical layer specification. ENSMB must be pulled high to enable SMBus mode and allow access to the configuration registers.

The DS64MB201 has the AD[3:0] inputs in SMBus mode. These pins set the SMBus slave address inputs. The AD[3:0] pins have internal pull-down. When left floating or pulled low the AD[3:0] = 0000'b, the device default address byte is A0'h. Based on the SMBus 2.0 specification, the DS64MB201 has a 7-bit slave address of 1010000'b. The LSB is set to 0'b (for a WRITE), thus the 8-bit value is 1010 0000'b or A0'h. The bold bits indicate the AD[3:0] pin map to the slave address bits [4:1]. The device address byte can be set with the use of the AD[3:0] inputs. Below are some examples.

AD[3:0] = 0001'b, the device address byte is A2'h

AD[3:0] = 0010'b, the device address byte is A4'h

AD[3:0] = 0100'b, the device address byte is A8'h

AD[3:0] = 1000'b, the device address byte is B0'h

The SDC and SDA pins are 3.3V LVCMOS signaling and include high-Z internal pull up resistors. External low impedance pull up resistors maybe required depending upon SMBus loading and speed. Note, these pins are not 5V tolerant.

TRANSFER OF DATA VIA THE SMBUS

During normal operation the data on SDA must be stable during the time when SDC is High.

There are three unique states for the SMBus:

START: A High-to-Low transition on SDA while SDC is High indicates a message START condition.

STOP: A Low-to-High transition on SDA while SDC is High indicates a message STOP condition.

IDLE: If SDC and SDA are both High for a time exceeding t_{BUF} from the last detected STOP condition or if they are High for a total exceeding the maximum specification for t_{HIGH} then the bus will transfer to the IDLE state.

SMBUS TRANSACTIONS

The device supports WRITE and READ transactions. See Register Description table for register address, type (Read/Write, Read Only), default value and function information.

When SMBus is enabled, all outputs of the DS64MB201 **must use one of the following De-emphasis settings** (Table 6). The driver de-emphasis value is set on a per lane basis using 6 different registers. Each register (0x18, 0x26, 0x2E, 0x35, 0x3C, 0x43) requires one of the following De-emphasis settings when in SMBus mode. The VOD for each output should be set via register write or pin control to be a minimum of 1000 mV.

TABLE 6. De-Emphasis Register Settings (must write one of the following when in SMBus mode)

De-Emphasis Value	Register Setting	3 Gbps Operation	6 Gbps Operation
0.0 dB	0x01	10" trace or 1 meter 28 awg cable	5" trace or 0.5 meter 28 awg cable
-3.5 dB	0xE8	20" trace or 2 meters 28 awg cable	10" trace or 1 meters 28 awg cable
-6 dB	0x88	25" trace or 3 meters cable	20" trace or 2 meters cable
-9 dB	0x90	5 meters 28 awg cable	3 meters 28 awg cable
-12 dB	0xA0	8 meters 28 awg cable	5 meters 28 awg cable

WRITING A REGISTER

To write a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a "0" indicating a WRITE.
2. The Device (Slave) drives the ACK bit ("0").
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit ("0").
5. The Host drive the 8-bit data byte.
6. The Device drives an ACK bit ("0").
7. The Host drives a STOP condition.

The WRITE transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

READING A REGISTER

To read a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a "0" indicating a WRITE.
2. The Device (Slave) drives the ACK bit ("0").
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit ("0").
5. The Host drives a START condition.
6. The Host drives the 7-bit SMBus Address, and a "1" indicating a READ.

7. The Device drives an ACK bit "0".
8. The Device drives the 8-bit data value (register contents).
9. The Host drives a NACK bit "1" indicating end of the READ transfer.
10. The Host drives a STOP condition.

The READ transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

RECOMMENDED SMBUS REGISTER SETTINGS

When SMBus mode is enabled (ENSMB = 1), the default register settings are not configured to an appropriate level. Below is the recommended settings to configure the EQ, VOD and DE to a medium level that supports interconnect length of 20 inches FR4 trace or 3 to 5 meters of cable length. Please refer to Table 1, Table 2, Table 6, Table 7 for additional information and recommended settings.

1. Reset the SMBus registers to default values:
Write 01'h to 0x00.
2. Set de-emphasis to -6 dB for all lanes:
Write 88'h to 0x18, 0x26, 0x2E, 0x35, 0x3C, 0x43.
3. Set equalization to external pin level EQ[1:0] = 00 (~9 dB at 3 GHz) for all lanes:
Write 30'h to 0x0F, 0x16, 0x1D, 0x24, 0x2C, 0x3A.
4. Set VOD = 1.0 Vp-p for all lanes:
Write 0F'h to 0x17, 0x25, 0x2D, 0x34, 0x3B, 0x42.

TABLE 7. SMBus Register Map

Address	Register Name	Bit (s)	Field	Type	Default	Description
0x00	Reset	7:1	Reserved	R/W	0x00	Set bits to 0.

FIGURE 9. Electrical Specification DJ4: 20" 4-mil microstrip trace on Output

Datarate: 3.2 Gbps

Input Pattern: K28.5

Signal Conditioning: EQ Setting = 20'h (Bypass) and DE Setting = 88'h

Applications Information

GENERAL RECOMMENDATIONS

The DS64MB201 is a high performance circuit capable of delivering excellent performance. Careful attention must be paid to the details associated with high-speed design as well as providing a clean power supply. Refer to the LVDS Owner's Manual for more detailed information on high speed design tips to address signal integrity design issues.

PCB LAYOUT CONSIDERATIONS FOR DIFFERENTIAL PAIRS

The CML inputs and LPDS outputs must have a controlled differential impedance of 100Ω . It is preferable to route differential lines exclusively on one layer of the board, particularly for the input traces. The use of vias should be avoided if possible. If vias must be used, they should be used sparingly and must be placed symmetrically for each side of a given differential pair. Route the differential signals away from other signals and noise sources on the printed circuit board. See AN-1187 for additional information on LLP packages.

POWER SUPPLY BYPASSING

Two approaches are recommended to ensure that the DS64MB201 is provided with an adequate power supply. First, the supply (VDD) and ground (GND) pins should be connected to power planes routed on adjacent layers of the printed circuit board. The layer thickness of the dielectric should be minimized so that the V_{DD} and GND planes create a low inductance supply with distributed capacitance. Second, careful attention to supply bypassing through the proper use of bypass capacitors is required. A $0.01\ \mu\text{F}$ bypass capacitor should be connected to each V_{DD} pin such that the capacitor is placed as close as possible to the DS64MB201. Smaller body size capacitors can help facilitate proper component placement. Additionally, three capacitors with capacitance in the range of $2.2\ \mu\text{F}$ to $10\ \mu\text{F}$ should be incorporated in the power supply bypassing design as well. These capacitors can be either tantalum or an ultra-low ESR ceramic.

Physical Dimensions inches (millimeters) unless otherwise noted

DIMENSIONS ARE IN MILLIMETERS
DIMENSIONS IN () FOR REFERENCE ONLY

RECOMMENDED LAND PATTERN

54-pin LLP Package (5.5 mm x 10 mm x 0.8 mm, 0.5 mm pitch)
Order Number: DS64MB201SQ — Tape & Reel Supplied As 2,000 Units,
DS64MB201SQE — Tape & Reel Supplied As 250 Units
Package Number: SQA54A

SQA54A (Rev B)

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
